more desperate and ruthless, the people at large more well disposed and willing to accept American rule, and the officers better acquainted with the people and able to distinguish between those who were active in the rebellion and those whom they blackmailed and intimidated. Houses and barrios, or small villages, from which troops were fired upon or which harbored and hid ladrones or insurrectos who were being pursued were destroyed, and hostile natives who were caught red-handed were no longer released after a few days, but were kept confined in great military prisons. The search for arms was so actively and thoroughly pursued that the natives turned in not only bolos, but rifles. The mountain barracks that the insurgents had built as storehouses and shelters in the rainy season were sought out and destroyed, as well as their watchtowers and lookouts, and in these quests quantities of rice, sugar, clothing, and ammunition were captured. To every insurgent who surrendered his rifle \$30 was given. The barbarities practiced by the insurgents to obtain contributions when their influence began to wane alienated the sympathies of most of their peaceful adherents. In the early

NATIVE FILIPINOS, AT ANGELES, SEVENTY MILES NORTH OF MANILA.

part of the war the Kalipunan, their secret society, had strong branches in every town, was active even in Manila, and in the interior controlled the whole population. Eleven of the officials at the head of the administration in the province of Tarlac were arrested and condemned for conspiring with

insurgent leaders, and presidentes of the villages had frequently to be deposed. The insurgents were strong enough to harass the garrisons daily. The generals led strong expeditions through the country, established posts, and the more the soldiers came into contact with the people and were able to protect the pacificos, the less formidable became the resistance. In the early spring campaigns were conducted under Gen. Hughes in Panay and under Gen. Bates and Gen. Kobbe in southeastern Luzon, attended by many sharp battles. Gradually, as the army occupied the islands and spread out into small garrisons, the number engaged descended the scale from brigades to regiments, to battalions, to companies, to squads, and while the number of actions increased, the number of casualties diminished. Thus in February, 1899, the first month of the rebellion, there were 64 engagements, in which 66 officers and men were killed and 360 wounded; in the second month 80 were killed and 563 wounded in 61 actions; and in June, when operations grew slack on account of the weather, 32 were killed and 135 wounded in 32 actions. In December, 1899, there were 75 actions, in which 19 were killed and 81 wounded; in January, 1900, when, besides desultory actions in the north, a regular campaign was proceeding in the southern provinces of Luzon, in 114 actions 41 Americans were killed and 131 wounded; in February, 30 were killed and 70 wounded in 104 actions; in March, 21 were killed and 62 wounded in 103 actions; in April, 38 were killed and 67 wounded in 121 actions; in May, 28 were killed and 66 wounded in 108 actions; in June, 25 were killed and 56 wounded in 131 actions. The conflict at this point had descended to bushwhacking and brigandage. The distribution of troops in 300 posts dispelled hostility and improved the temper of the people, who had been originally aroused by absurd falsehoods of the leaders, such as the statement that the United States Government meant to place them on reservations, where they would die out like the American redmen. Insurgents who did not surrender after defeat divided into small guerrilla bands or became ladrones. The mass of the people longed for peace and were willing to accept the government of the United States. Nearly all the prominent generals and politicians of the insurrection were either captured in these months or voluntarily surrendered and took the oath of allegiance to the United States. The policy of leniency and the promise of amnesty induced them to surrender. The small bodies of insurgents remaining under arms fled to mountain fastnesses, whence they issued for night attacks, usually harmless, or to ambush small American detachments, or to collect contributions or recruit among the people, whom they terrorized by cutting out tongues, cutting off limbs, or burying alive, and by their murders and robberies. They made themselves detestable, and still they maintained a surveillance over the people, even in garrisoned towns, and whoever gave information to the Americans usually risked his life.

In June the Filipino leaders plotted an uprising against the authorities in Manila, a general massacre of Americans and of the natives serving or friendly to the Government, and the seizure of arms and ammunition to re-equip the insurgent forces. Inhuman conduct marked the guerrilla campaign from the beginning on the part of the insurgents. When one of their camps was attacked in January they tried to strike terror into the breasts of the Americans by leading out 5 prisoners and shooting them. Their military power, even as a guerrilla force, was broken before

the rainy season began. Yet their reign of terror continued, and the acts of vengeance and rapine that they committed on the amigos, the friends of the Americans, necessitated constant vigilance and activity on the part of the troops.

On June 21, 1900, by direction of the President, a proclamation was issued by Gen. MacArthur granting amnesty to all insurgents who made submission. Many of the leaders took advantage of it, and large numbers of insurgents delivered up their arms.

Aguinaldo and the other leaders who still held out were watching the trend of public opinion in the United States. When they found that the leaders of one of the great political parties seemed ready to commit the fate of the Philippine Islands into their care, and that whereas before only a group of independent politicians and publicists in the United States befriended them, they had a prospect of making terms with the United States Government to suit themselves if the presidential election should be won by that party, they were spurred to a supreme effort. When the issue was once raised in American politics fresh disturbances broke out, not in Luzon alone, but in Leyte, Panay, Samar, Cebu, and other islands where the Tagalogs had introduced their doctrines and authority in the early days of the rebellion. In central and northern Luzon, which American troops had first occupied in force, the natives had learned to trust Americans and to desire a settled state of affairs under their government. They could not be stirred up anew to any extent. Some of the principal members of Aguinaldo's former government, such as Buencamino, the Secretary of State in the Malolos administration, Mabini, and Paterno, and some of his best generals were now co-operating heartily with the Americans, and telling the natives to submit. Of the generals, Pio del Pilar, Macabulos, Catalino, Garcia, and others had surrendered or been captured. It was in southern Luzon and the Visayas that the hostilities broke out anew. The departure of two regiments for China, and the prospective return to America of the volunteers forming half the army of occupation in a few months, encouraged the insurgent leaders in the belief that they could by holding out have matters go in any way they would. The inclination of the people not actively engaged in the rebellion to embrace the American cause was checked by the revival of terrorism. The presidentes and municipal councilors appointed in towns where local self-government was being introduced under American auspices were in some instances murdered even in central Luzon. The army of 65,000 men could not guard against such reprisals. The men formerly identified with the Philippine Republic and prominent Filipinos who preceded them in the expression of American sympathies were no longer safe in Manila. Many of them went away to Hong-Kong. The high prices of food—40 to 75 cents a pound in gold for meat, and rice double the normal price—had much to do with the discontent. In Spanish times the Government came into competition with the venders when meat sold for more than 10 cents a pound. All northern Luzon, except in Nueva Ecija and Bulacan, was practically free from insurgents in August, and the people were planting and asking for municipal government. In southern Luzon insurrectionary bands were dodging from one mountain refuge to another, as also in Samar, Leyte, and parts of Panay; but in Negros, Cebu, Romblon, Masbate, Sibuyan, Tablas, Bohol, and other Visayan islands there was little disturbance. In Mindanao ladrones made the country dangerous near the old Tagalog penal settlement of Cagayan

BRIDGE OF SPAIN, MANILA.

1

and at Surigao. Every effort that the insurgent leaders made to mass together enough men to crush one of the garrisons failed. The recrudescence of disturbances began in August, and in September the situation became so much worse that Gen. MacArthur asked for and received reinforcements to his army of 65,000 men. So many men were required to furnish supplies to distant garrisons, escorts for wagon trains and for military and civil officers, and the protection of peaceful natives against ladrones and vengeful insurgents, as also the Government property scattered among the numerous stations, that few were left for active operations against the remaining insurgents and robber bands. In September the country north of Pasig, including all Bulacan, became disturbed, as well as the south, including Tayabas. At Mavitac, Capt. Mitchell with 140 men attacked 800 insurgents in position, and eventually they were forced to retreat, but the 2 chief officers and 22 men of the Americans lost their lives. Several small engagements took place in the Ilocan provinces. In October the insurgents redoubled their activity, although without having any centralized military organization. Their civil administration had entirely disappeared when their army was broken up and the United States troops occupied the provinces, except that wherever municipalities were organized by the Americans rival municipal authorities secretly collected contributions and exercised judicial and executive powers in the name of the Philippine Republic. In some instances they were the very officials whom the American Government had installed, who seemed to carry out their proper official duties and their treasonable activities with equal zeal. One band of about 400 insurgents the troops pursued vigorously and wiped out because it was led by an American deserter. In an engagement fought on Oct. 24 a small force of Americans was compelled to retreat before several thousand insurgents. Gen. Vicente Lukban and his men had full sway in the island of Samar with the exception of Catbalogan, Calbayog, and Labuan, and the American garrisons in these seacoast towns he worried constantly and defied. Other such freebooters flourished in places where the Americans could not develop military strength, growing rich from the tribute they levied on the planters and merchants, but having no communication with each other or with Aguinaldo, who was still in hiding. A Filipino representative, Agoncillo, appeared at this time in the United States and issued a proclamation declaring that the war would last until the Filipinos gained independence; that such was the desire of the entire population; and that even if the Americans triumphed, peace would be only temporary, and a strong army would be required to hold the people in subjection.

After the presidential election was over the extraordinary rebel activity subsided at once. No insurgents were left excepting marauding bands of ladrones and the independent military chiefs who lived by blackmail. Notorious desperadoes who feared punishment for their crimes kept a few followers together in the mountains. The rest of the insurgents gradually surrendered, and in provinces such as Iloilo, in the island of Panay, where the bulk of the people, through rebel sympathies or fear of rebel vengeance, had hesitated to take the oath, they came in thousands to swear allegiance to the United States. The Katipunan Tagalogs, who were the backbone of the revolution, and the native padres, who had done most to encourage the spirit of resistance, accepted American sovereignty with apparent sincerity or resignation. The submission of the Tagalogs set the troops free

to re-establish peace and introduce orderly government in the southern islands.

Organization of Civil Government.—The Philippine Commission, appointed to report on the question of civil government for the islands, composed of J. G. Schurman, George Dewey, Charles Denby, and Dean C. Worcester, reported to the President in January, 1900, recommending the appointment of an American governor, to be assisted by a council containing both natives and Americans, and of provincial governors, who should be Americans. The constitution of a Legislative Assembly was suggested, part of the members of which should be elected and the others nominated, the acts of this body to be subject to veto by the United States Government. The islands should be subdivided into administrative divisions, and natives as well as Americans would be eligible for administrative offices. A new Philippine Commission was appointed to report to the President on the conditions of the islands, to legislate in civil and financial matters subject to the approval of the military authorities, and to formulate schemes for local self-government and the development of civil institutions to supersede the military authority after the establishment of order. The decree introducing autonomous and decentralized municipal government was promulgated by Gen. Otis on March 29, 1900. The laws for the government of the Philippine municipalities were prepared by a board of which Cayetano Arellano, Chief Justice of the Philippines, was president. The municipal government of each town was vested in an alcalde and a municipal council, to be

A TAGALOG, NATIVE OF MALABON.

chosen at large by the qualified electors of the town for the term of two years from the first Monday in January next after the election and until their successors are chosen and qualified. The number of councilors varies from 3 in towns of fewer than 10,000 inhabitants up to 18 in towns of the first class with over 25,000 inhabitants. Each elector before casting his ballot is compelled to take an oath that he is not a citizen or a subject of any foreign power, and that he recognizes and accepts the supreme authority of the United States of America, and will maintain true faith and allegiance thereto. The electors are those who have held office under Spanish rule as municipal captain, gobernadorcillo, or lieutenant; those who pay \$30 or more in taxes; and those who speak, read, and write English and Spanish. Ecclesiastics, soldiers in active service, persons receiving salaries from municipal, provincial, or Government funds, debtors to such funds, contractors of public works and

their bondsmen, clerks and functionaries of the administration, bankrupts until discharged, or insane or feeble-minded persons can in no case be elected or appointed to municipal office. The alcalde is authorized to appoint all nonelective officers of the municipality, exact punctual payment of taxes, and punish violations of municipal ordinances and regulations. The municipal council has power to create the offices of municipal attorney, treasurer, secretary, and such offices as may be necessary to manage the finances and property of the town, maintain municipal prisons, fire department, and schools, and to levy and collect taxes. All ordinances before taking effect are to

not higher than in the average American State. These with the revised customs tariff would give less annoyance than the Spanish taxes, and after peace was restored would produce a revenue sufficient to pay the expenses of efficient government, including a militia and constabulary. The adoption of the gold standard of currency was recommended. The commission prepared a stringent civil service law, giving opportunity to Filipinos and Americans, with preference to the former where qualifications are equal, to enter the lowest rank, and by promotion reach the head of the department. Later soldiers who had been detailed to discharge civil offices, and who wished on their

THE CITY OF JOLO.

be approved by the alcalde. Taxation shall be uniform and just, and persons deeming themselves injured by any tax levy may protest to the council and appeal from its decision through the alcalde to the provincial governor. The governor of the province is president of all the municipal councils, and may inspect and supervise the administration of all municipal affairs, hear and determine all appeals against the acts of municipal corporations or their officers, and suspend or remove municipal officers and appoint substitutes until the next general election, or may call a special election, reporting the cause to the governor of the islands. As a temporary expedient the commanding officers of military districts were authorized to appoint the first alcaldes if it was not practicable or advisable to have them elected. The municipal governments were soon established under the provisions of this law. In villages presidents were appointed in accordance with the choice of the people. When such officers were detected in seditious acts they were removed and others were appointed. The new Philippine Commission had for its president Judge William H. Taft, with whom were associated Dean C. Worcester, Luke E. Wright, Henry C. Ide, and Bernard Moses. The commissioners formulated new tariff and tax laws. The Spanish tariff rates that were still operative were nearly prohibitory for many articles, preventing the importation from America of canned goods, machinery, and other important commodities. The Spanish revenue laws threw the burden of taxation on the poor and gave the wealthy comparative immunity. The inland revenue was derived chiefly from the poll tax, the taxation of small businesses, a fishing license, and the like. The commissioners recommended instead a reasonable land tax and a tax on corporation franchises

discharge from the army to remain in the civil service, were exempted from examinations. Reforms in civil and criminal procedure, the criminal code, and the judicial system were adopted on the recommendation of the Filipino bar. A branch railroad into the mining country of Luzon, 45 miles in length, was considered favorably. Calls came from all parts of the islands for public schools, and the supply of English teachers was far short of the demand. Native children showed great aptitude in learning English. Night schools were established for teaching English to adults. Only a small fraction of the people speak Spanish. The creation of a central government like that of Porto Rico, securing all rights described in the bill of rights and the Federal Constitution, promised to bring contentment, prosperity, education, and political enlightenment. The subsidence of the rebellion toward the close of the year gave grounds for the opinion that the disturbances could better be suppressed by the native police of a civil government, with the army as an auxiliary force, than by a continuance of complete military control. The commission was embarrassed in securing good material for judicial and other service by the provisional character of the military government and its uncertainty of tenure. Legislation by congress to create a central civil government was urgently needed. Until such a bill was passed no public franchises could be granted, nor any mining claims, and no substantial investment of private capital in internal improvements was possible. The sale of public lands, forest concessions, and the grant of railroad and other franchises seemed desirable to the commissioners, and especially the starting of mines by hundreds of American miners who were on the ground awaiting a law to perfect their claims. The beginning of

these enterprises would be a good element in pacification, and it was recommended that the operation of the law of Congress to establish civil government be not postponed until the complete suppression of all insurrection, but only until, in the President's opinion, civil government may be safely established. In the first public legislative session of the Philippine Commission \$2,000,000 in silver were voted for the construction of roads and bridges, \$5,000 for the preliminary survey of the proposed railroad from Dagupan to Benguet, and \$5,400 for schools.

A strong peace party, called the Federals, was organized among the Filipinos. They favored the adoption by the natives of the Protestant religion, and later another party, the Conservatives, also in favor of peace and American sovereignty, was formed to represent the views of the native priests, and to voice the hope of ultimate national independence after a period of American rule and tutelage. The problem of the friars, which led to the original rebellion against Spanish authority, was the one that agitated the Filipinos most. The friar was the embodiment of all authority, governmental as well as religious, in his locality. The rebels expelled the friars from their places, and the Filipinos were generally opposed to allowing them to return. Immorality was one of the grounds of complaint, and instances were proved, but this was not the principal one. The Augustinians, the Dominicans, the Franciscans, and the Recolletos are owners of 403,000 acres of cultivated ground, besides which they have large sums of money to loan. The United States engaged to protect them in their possessions in the treaty with Spain. They had transferred their property to others, but the transfers are not genuine and they remain the owners. The commission recommends that their estates be purchased for public lands out of the island revenues, by condemnation if necessary, though the orders have expressed a willingness to sell at a satisfactory price. The secular clergy is composed mainly of Filipinos, while the monks are mostly Spaniards. The important cures have been filled by these monks, and the commissioners would like to see American priests sent to the islands to take their place. The commission enacted a law when the insurrection had subsided declaring persons ineligible to public office who were found in arms against the United States authority after March 1, 1901, or who aided or abetted insurrectionists. Sites for penal settlements and for a leper colony were found in the southern islands.

PHYSICS, PROGRESS OF, IN 1900. Constitution and Properties of Matter. Inorganic Life.—Guillaume (Archives des Sciences, February) notes that certain physical processes have close analogies in physiology, and may be regarded as constituting an elementary form of life. Among such processes are fatigue and adaptation to impressed forces. An instance of the latter is the hardening of a metal at the point of impending rupture, which may be termed an instance of protective modification. Similarly the gray iodide or chloride of silver in the Becquerel process of color photography assumes the color of the incident light, and thus enables itself to reflect it. If it did not do that it would have to absorb the radiation, and the energy so absorbed would have the effect of reducing the silver salt.

Matter and Ether.—Sagnac (Comptes Rendus, Nov. 20, 1899) shows that Fizeau's effect, in which the ether is apparently dragged along by a column of water in motion, consists of two opposite effects—the mass effect, which, owing to the diminution by its motion of the useful mass of water traversed

by the ray, produces an apparent dragging of the ether, and the motion effect, which is the same as if the cylinder containing the water moved with respect to the source, without any water entering or leaving it. The whole effect is a retardation in the time of propagation. Kelvin (Philosophical Magazine, August) has solved mathematically two problems relating to the motion of matter through the ether, namely, to find the orbit of an ether particle disturbed by a moving atom and the path traced through an atom (supposed fixed) while the ether moves uniformly in parallel lines. In a subsequent paper (ibid., September) he shows that gravity may be explained by supposing the positive electron to condense ether in its neighborhood and the negative electron to rarefy it.

Size of Molecules.—Gerstmann (German Physical Society, Oct. 20, 1899) has tried to estimate the size of molecules by determining the heat of solution of a nonelectrolytic substance in a liquid when the former is taken (1) in a lump, (2) in a finely powdered condition, and also the heat absorbed on mixing two such solutions of different concentrations. He used a special modification of Bunsen's calorimeter, but so far has attained no other result than that the two heats of solution differ from each other. Jäger (Vienna Academy) calculates the sizes of the ions, or electric carriers in an electrolyte, from the specific resistance, on the assumption that this resistance is entirely due to viscosity. He also assumes that the ions are spheres, that anion and cation have equal diameters, and that the density of the electrolyte is the true density of the material. For potassium chloride he finds $d = 66 \times 10^{-8}$ centimetres, while according to the kinetic theory of gases $d = 96 \times 10^{-8}$ centimetres for chlorine alone. (See also *Electrification*, under **ELECTRICITY**, below.)

Molecular Motion.—Exner (Annalen der Physik, August) has studied the velocity of particles in so-called Brownian motion, using gum dissolved in alcohol and precipitated by water. At a temperature of 23°, particles 0.0004 millimetre in diameter were found to move with a speed of 0.0038 millimetre a second; those 0.0009 millimetre in diameter, 0.0033 millimetre a second; and those 0.0013 in diameter, 0.0027 millimetre a second. The velocity increased slightly with temperature, and it appeared that motion would cease at -20° C. rather than at the absolute zero. The author believes the motion to be connected with that of the liquid molecules, although this is about 100,000 times greater.

Gravity.—Sterneck (Vienna Academy Sitzungsberichte, 108, 1899) has made observations in mines in Bohemia and Carniola whose results seem to indicate that a downward increase in temperature tends to be associated with an increase in gravity.

Mechanics. Strength of Materials.—Guest (Philosophical Magazine, July), in an investigation of the strength of ductile materials under combined stress, subjected steel, copper, and brass tubes to twisting, tension, and internal pressure, and to various combinations of these. The maximum principal strain was found to be greatest in the simple tension experiments and least either in the torsion tests or when the axial and circumferential tensions are equal. The principal practical conclusion is that a specific shearing stress is a necessary condition for the initial yield of a uniform ductile material.

Elasticity.—Schaefer (German Physical Society, 2, p. 11, 1900) has investigated the elasticity of metals at temperatures as low as the boiling point of liquid air (-186° C.). He finds that the lateral contraction of wires increases with the temperature; that the greater the thermal coefficient of

expansion the higher the temperature coefficient (except with gold); and that lowering the temperature raises the limits of elasticity. The results agree well with those of other experimenters.

Impact.—Vincent (Cambridge Philosophical Society, Aug. 13) finds that when nondeformable spheres impinge on plane surfaces of lead, paraffin, brass, or cast iron with not too great velocity the square of the diameter of the dent is proportional to the velocity. For spheres of the same material and equal velocity the diameter of the dent is proportional to the diameter of the sphere. The volume of the dent is proportional to the energy of motion of the sphere just before impact. For steady loads the square of the diameter of the dent is proportional to the load. The time of impact is directly proportional to the diameter of the ball, other things being equal.

Liquids and Gases. Solution.—Nernst (Göttingen Academy of Sciences, 1, 1900) believes that the validity of the hydrate theory of solution can not be ascertained by study of osmotic pressure or of any other static phenomenon, but only by dynamic phenomena, such as the movement of a third added substance on diffusion or electrolysis. Results of experiments on these lines indicate that hydration in a solution is either entirely absent or takes place only to a limited extent. Rothmund (Zeitschrift für physikalische Chemie, May 18) deduces from experiment that the decreased solubility of nonelectrolytes caused by the addition to the water of various salts is due not to a reaction between the substance and the dissolved salt—which would be accompanied by some heat effect—but to some action of the salt on the water. Zsigmondy (Zeitschrift für physikalische Chemie, April 3) opposes the conclusion arrived at by Stoeckl and Vanino, that the so-called colloidal solutions of metals are merely suspensions. He regards them as real solutions, since they exhibit the peculiarities of such solutions, namely, some osmotic pressure and power of diffusion, concentration without apparent change, separation when the solvent freezes, and impossibility of separation. That colloidal gold solutions give a diffusely reflected light which is elliptically polarized, are precipitated by animal charcoal, and behave toward the electric current like suspensions, is not regarded by the author as conclusive proof that they are suspensions. Schaum (Physikalische Zeitschrift, 1, 1899) has investigated the motion of substances while dissolving, analogous to the well-known motion of camphor in water. The substances dealt with are mostly salts readily soluble in water and dilute acids. The motion is always greater in dilute acid than in water, and its nature is characteristic. The crystal generally moves at first in a zigzag, then changes to a curve, and finally rotates rapidly. The rate of motion depends on the rate of solution. (See also *Double Refraction*, under LIGHT.)

Surface Tension; Films.—Hall (Dublin Royal Society, 9, 1899) shows that the liquor from the settling of the froth of a soap is stronger in soap than the original solution. There must be a concentration of soapy matter after the formation of a film, which agrees with Rayleigh's investigations of the stability of soap bubbles. Donnau (Zeitschrift für physikalische Chemie, Dec. 22, 1899), from experiments on soap emulsions, after comparison with the results of Kraftt on the boiling points of soap solutions with those of Rayleigh on the formation of froth on liquids, and with Hall's observation just mentioned, concludes that surface concentration causes a considerable diminution in the amount of work necessary to increase the surface of separation of an oil and alkali

solution, and that it is to this that the formation of small bubbles is due. Malagoli (Nuovo Cimento, May) produces durable films on skeleton figures by dissolving 40 grammes of gelatin and 10 grammes of soap in 500 of water at a temperature not exceeding 80° C. The films are obtained by dipping the skeletons into the solution and drying for twelve hours. They are not thin enough to show interference colors. Vincent (Journal de Physique, February) believes that a thin film of silver on glass is bounded on both sides by what he calls "transition superficial layers," of a different constitution from the rest of the metal. These in the case of silver are of smaller conductivity and the joint thickness of the two is about 50×10^{-7} centimetres. Quincke (Annalen der Physik, June) combats this idea, and attributes the observed variation of resistance to a variation of density. This author believes that in all cases wedges of solid material are to be preferred to liquid films for the determination of molecular forces.

Condensation.—Barus (Science, Feb. 9) believes that condensation is due always to nuclei primarily, and that whether these are ionized or not is of secondary importance. There is no noteworthy difference between the action of air carrying such dust and that of ionized air.

Air Resistance.—Bryan (Nature, Nov. 30, 1899) describes recent researches of Le Dantec and of Canovetti on this subject. Le Dantec makes the surface under test slide down a vertical wire. The start releases an electric recording device, and the current is broken when the body strikes the buffer at the end of its descent, which occupies 1, 2, or 3 seconds. A surface 1 metre square at a velocity of 1 metre per second experiences a resistance of 81 grammes. The form of the plate is of importance, and the resistance appears to be proportional to the length of the contour. The law that within certain limits the resistance is proportional to the square of the velocity is verified.

Canovetti suspends his bodies from a wire 370 metres in length, stretched along the slope of a hill. The resistance was found to be 90 grammes (instead of Le Dantec's 81). He also tried bodies of the shape of a Challais balloon—a long cone and a hemisphere joined by their bases, enveloped in a net; the resistance was 80 grammes, and largely due to the net.

Gaseous Viscosity.—Jäger (Vienna Academy Sitzungsberichte, January—March) finds that the path over which a molecule carries a definite amount of momentum exceeds its mean free path by the diameter of a molecule at most, and is only one half this on the average. As the viscosity is proportional to this path, it is also a function of molecular diameter, and when this becomes very large the viscosity approximates to infinity. The author shows this more exactly by formulæ.

Explosive Waves.—Le Chatelier (Comptes Rendus, June 25) shows by photographic methods that in various explosive mixtures ignited by an electric spark the speed of propagation of the flame at once assumes a value of several hundred metres a second, and rapidly increases to beyond 1,000. Shortly after the appearance of the flame the explosive wave, with a greater and uniform velocity, is suddenly formed. The distances traveled by the flame before the formation of the explosive wave vary from 1 decimetre to 1 metre. The greatest observed velocity of the explosive wave was 2,920 metres per second. Vieille (Comptes Rendus, Dec. 26, 1899) finds that explosives are not necessary to produce waves of

velocity much higher than that of sound. When air is shut off by a collodion diaphragm at the end of a tube, and is compressed by a piston, the wave generated when the collodion bursts has a very high velocity. Some such diaphragms will burst at a pressure of 27 atmospheres, and the wave is then propagated faster than 600 metres per second. The rate decreases by about 20 metres per second for every metre traversed, until it becomes the ordinary velocity of sound. (See also *Temperature of Flames*, under HEAT).

Efflux of Gases.—Emden (Wiedemann's *Annalen*, October, 1899) has developed the mathematical theory of the efflux of gas under pressure, starting from the position that, if the efflux is steady, equal masses and equal quantities of energy must pass the space between two cross sections of the tube in each unit of time. He arrives at the following important generalizations: The velocity with which the gas passes the orifice can never become greater than the velocity of sound at that point. The pressure at which a jet begins to pass the orifice with this velocity corresponds to the velocity of efflux at which stationary sound waves are formed in the jet. In this manner sound waves of very small wave length and very high frequency may be formed, possessing greater energy than any yet produced.

Acoustics. Velocity of Sound.—Witkowski (Bulletin of the Cracow Academy of Science, 16, p. 138), by experimenting with compressed air by Kundt's method at various temperatures and pressures, has shown that the velocity of sound varies with the pressure, the variation being greatest at the lowest temperatures. At zero the velocity slowly rises with the pressure, being about 10 per cent. higher at 100 atmospheres than at 1 atmosphere. At 100° the velocity remains nearly the same at all pressures, while at -130° it rapidly falls with increasing pressure. Brillouin (*Annales de Chimie et de Physique*, 18, 1899) shows mathematically that when the transmission of sound with its condensations and rarefactions takes place in a mixture of gases, gaseous diffusion must be taken into account, as it causes variations in composition of the medium.

Pitch.—Koenig (Wiedemann's *Annalen*, November and December, 1899) finds that Kundt's dust figures can be used to determine pitches high above the limits of audibility. The fork *c'*, placed at the mouth of a tube with a length of some 95 semi-wave-lengths, and a diameter of about one semi-wave-length (11 millimetres) gives very clearly defined figures. The method is available up to f° (90,000 complete vibrations per second), a pitch which is more than an octave above the extreme limit of audibility. The method of beats ceases to be practically available two octaves below that limit.

Phonography.—Mauro (*Journal of the Franklin Institute*, July) describes a modification of Bell and Tainter's graphophone in which undulations of greater amplitude are insured by increasing the velocity of the style. The style is set at a more acute angle, and the diameter of the cylinder is increased. The increase in velocity also prevents the shank of the style from coming into contact with the wax and so checking the vibration.

Heat. Thermometry.—Holborn and Day (*American Journal of Science*, September, 1899) find that up to 500° C. thermometer bulbs of Jena borosilicate glass No. 59^m with inclosed hydrogen prove most satisfactory, no appreciable changes in the zero point being shown after repeated heatings. Callendar (*Philosophical Magazine*, December, 1899) advocates the adoption of

a new practical temperature scale, to be known as the "British Association Standard." According to this standard any temperature, t , would be defined by the equation $t - pt = dt(t - 100)$, where $pt = 100 (R - R_0) / (R_{100} - R_0)$ and d is a constant, R , R_0 , and R_{100} being the electrical resistances of a particular platinum wire at t , 0° and 100° C. respectively, and the value of d being obtained by taking the boiling point of sulphur under 76 centimetres of mercury at 0° C. as 444.53° C. This scale is subject to far less uncertainty, especially at high temperatures, than that practically obtained with gas thermometers as at present constructed and used; it is easily and accurately reproducible, and is a close approximation to Kelvin's absolute scale.

Conduction.—Smolan (Vienna Academy) states that at the boundary between a solid and gas, across which a flow of heat takes place, there is an abrupt change of temperature. When the whole temperature difference is small this may be expressed as an imaginary length added to the thickness of gas through which conduction is taking place. These lengths in different gases are proportional to the mean free path, being 6.98 times as long for hydrogen as for carbonic acid, and 1.70 time for air.

Radiant Heat.—Planck (*Annalen der Physik*, April) endeavors to find an expression for the entropy of radiant heat which is in agreement with all the data of thermodynamics and of the electromagnetic theory of light. He also arrives at a numerical value of the temperature of a monochromatic radiation emitted by a small surface and refracted by a system of centric surfaces. The temperature of the radiation is completely defined without reference to that of the body which emits it, or to the losses suffered on the way. It is more rational, the author thinks, to speak of the temperature of a monochromatic beam of sunlight than of the temperature of the sun. Liesegang (*Physikalische Zeitschrift*, April 14) has succeeded in making a paper sensitive to long heat waves by painting it with equal quantities of hydroquinone and anhydrous sodium carbonate, mixed with a little alcohol. On exposure to the radiation of a gas stove the blue color of this paper is completely bleached in five seconds, and shadow pictures of coins can be obtained. Kurlbaum (*Annalen der Physik*, July) finds that the temperature of the surface of a radiating body is by no means that of the interior, as is usually assumed. With a sheet of blackened platinum foil 1μ thick the difference of temperature is 0.016° when the sheet is heated 4° above its surroundings.

Convection.—Bénard (*Comptes Rendus*, April 9 and 17) finds that a thin layer of liquid heated uniformly from below may assume a stable condition in which it becomes divided into regular polygonal prismatic cellules, in each of which the liquid ascends along the axis and descends along the outside. The forms have remarkable permanence and perfection.

Specific Heat.—Magie (*Physical Review*, August, 1899) shows theoretically that the osmotic pressure of a solution is equal to its latent heat of expansion, and also points out the special cases (four in number) where the specific heats of the solvent and of the solute in a solution are constant at all concentrations.

Ebullition.—Speyers (*American Journal of Science*, May) shows that if we know the molecular aggregations of the constituents in a homogeneous mixture of two liquids it is possible to plot the boiling-point curve of such a mixture. The equation employed is $n/(N + n) = (p - p')/d$

where $p-p'$ is the diminution in vapor pressure produced by the addition of n molecules of one liquid to N molecules of the other. Ryland (American Chemical Journal, November, 1899) has examined 80 binary mixtures of liquids mutually soluble in all proportions and two mixtures of liquids whose mutual solubilities are limited. Forty-five of the former give distillates which boil at a constant temperature, the ratio of the components then being nearly that of the products of the vapor densities and vapor pressures of the pure liquids at that temperature. Both of the latter mixtures form distillates with the like property so long as there are two layers of liquids in the distilling flask; these distillates are, however, not true chemical compounds.

Freezing.—Wildermann (Zeitschrift für physikalische Chemie, Dec. 1, 1899), in experiments on the freezing points of dilute solutions, has obtained the following results, among others: When the freezing point is depressed by about 0.02° needles or flakes of ice separate throughout the solution, but if the depression is only a few thousandths the ice separates in bands or in a continuous cap on the bulb of the thermometer. The freezing point of water, freed from ammonia and carbon dioxide by a current of pure air, varies to a noticeable extent owing to the presence in it of a variable amount of dissolved oxygen and other nonelectrolytic matter. He shows how to calculate the difference between the observed (or apparent) freezing point and the real freezing point. The error varies, according to methods, from 0.00002° C. to 0.004° C.

Temperature of Flames.—Mache (Vienna Academy Sitzungsberichte, 108, 1899) has investigated the temperature gradient in a homogeneous mixture of burning gases, such as a detonating mixture of oxygen and hydrogen. An explosion travels with definite velocity along a tube so filled, the gases on one side of the burning surface having the temperature of combustion, on the other that of ignition. The transition is abrupt. The author shows that the temperature decreases rapidly away from the burning surface, being 600° at 12 centimetres distance, 200° at 65 centimetres, and 50° at 22 centimetres.

Light. Theory.—Sagnac (Comptes Rendus, Nov. 13, 1899) considers the luminous vibrations in the interior of a body as being propagated by the intervention of a medium identical with the ether of a vacuum, and differing from it neither in density nor in elasticity. The phenomena usually referred to mechanical reactions between the ether and matter are explained by taking account of the discontinuity of matter. Carvallo (ibid., Jan. 8) doubts the truth of the received theory that white light is due to a damped vibration. If this were the case, he asserts, the grating spectrum would give white light over its whole area. The accepted theory neglects radiation which, although insensible to the eye in isolated regions, become of notable amount in the case under consideration. Gouy (ibid., Jan. 29) criticises these contentions. He acknowledges that the resolution of white light into simple vibrations is purely fictitious, but maintains that it enables us to calculate the total energy spent between two given epochs. Damped oscillations form a workable hypothesis, although not the only one.

Standards.—From the results of his work on standards of light, Petavel (London Royal Society, 65, p. 469) states that the probable variation in the light emitted by molten platinum under standard conditions is not above 1 per cent., and the accuracy of this standard is capable of being increased.

Brightness.—Lummer and Kurlbaum (German Physical Society, 2, 8, 1900) find that the ratio of the brightnesses of two hollow platinum vessels at different temperatures is equal to the ratio of those temperatures, taken on the absolute scale, raised to a power that grows less as the temperature increases.

Reflection.—Hagen and Rubens (Annalen der Physik, February) have determined the reflective powers of various metals and of glass mirrors for the various rays of the visible spectrum by a photometric method. As a general rule, the reflective power of metals increases with the wave length of the light. Thus the reflective power of gold for rays of wave length 700 is the same as that of silver.

Double Refraction.—Hill (Philosophical Magazine, December, 1899) has studied the double refraction introduced in solutions of colloids, such as gelatin and gum arabic, by stirring, and concludes that such solutions are not true solutions in the proper sense of the term, since their behavior is much more like that of an elastic solid, as they are able to sustain strains if not distorted too much. He believes that their structure is similar to that of jellies.

Interference.—Lummer (Berlin Academy, May 3) has studied the phenomena observed when one looks at a bright surface through two right-angled prisms placed with their hypotenuses together, but separated by a thin film of air, and with the eye focused for parallel rays. A system of interference fringes is seen parallel to the line bounding the area of total reflection, and the author has discovered that in reflected light two systems of fringes are obtained, one complementary to the other.

Polarization.—Forchheimer (Zeitschrift für physikalische Chemie, July 3) has proved experimentally the substantial truth of Perkins's view that the behavior of salts with relation to electromagnetic rotation of the plane of polarization is analogous to that of the corresponding acids. Solutions of the sulphates of ammonium, sodium, and magnesium resemble sulphuric acid in having the molecular rotation independent of the concentration, and the same is true of hydrochloric acid and various haloid salts; but with both the sulphate and the chloride of lithium the rotation increases with the dilution, a property that seems to be peculiar to lithium salts. (See also *Fluorescence*, just below.)

Dispersion.—Schmauss (Annalen der Physik, June) finds that the general form of the law of optical dispersion can also be applied to the dispersion observed in the Faraday effect, so that the magnetic-rotatory dispersion shows discontinuities near the absorption bands of certain substances, just as the optical dispersion does.

Phosphorescence.—C. C. Trowbridge (Science, Aug. 25, 1899) finds that the reduction of the temperature of a phosphorescing substance is accompanied by a corresponding decrease in the phosphorescent discharge; that very low temperatures cause phosphorescence to linger long enough to be readily observed in substances not visibly phosphorescent at ordinary temperatures; and that the production of phosphorescence is less when excitation occurs at low temperatures.

Fluorescence.—Hewitt (Chemical Society Proceedings, Jan. 24) finds that the molecules of fluorescent substances are probably those capable of vibrating in two different periods. Fluorescent coloring matters exhibit tautomerism almost without exception. Schincaglia (Nuovo Cimento, September, 1899) finds that in isotropic substances the light of fluorescence is never po-

larized; in crystals it generally presents only traces of polarization, except in topaz, in which it is completely polarized. Fluorescence of crystals depends usually upon chemical impurities, probably distributed in accordance with structure. The color of a crystal has no influence upon fluorescence, except to affect the color. A magnetic field has no effect upon the color of the fluorescent light, and causes nothing analogous to the Zeeman effect.

Becquerel Rays: Nature and General Properties.

—M. and Mme. Curie (Comptes Rendus, Nov. 6, 1899) find that the rays from strongly radio-active substances are able to communicate radio-activity to substances that are ordinarily inactive, and that this induced radio-activity persists for a considerable time. The effects seem not to be due to traces of radio-active matter carried on to the exposed plate, but an induced radio-activity appears to exist, which is a sort of secondary radiation due to the rays of Becquerel. Becquerel (Comptes Rendus, June 11) notes that two different kinds of the rays bearing his name have up to the present time been discovered. One resembles cathode rays and is deflected both by magnetic and electric forces. The other is deflected by neither, and is absorbed in various degrees by metals and other opaque substances. Radium emits both, polonium only the second, and actinium only the first. It seems probable that uranium has a definite though feeble radiation of its own. Villard (Comptes Rendus, April 30) has shown the heterogeneous nature of the rays given out by radium preparations, by allowing such rays to pass through a slit in a lead plate, and to impinge at nearly grazing incidence upon two sensitive plates laid one over the other and wrapped in black paper. The rays are exposed to a strong magnetic field. On development the upper plate shows two impressions—one deviated and spread out, the other feebler, but absolutely rectilinear and sharp. On the lower plate only one impression is visible—that due to the undeflected rays. The author calls the two classes of rays simply X rays and cathode rays. Mme. Curie (Comptes Rendus, Jan. 8) finds that the rays are more easily absorbed when they have already penetrated an absorbing layer than when they have not, which is due to the absorption of the less penetrative rays in the first layers. Behrendesen (Annalen der Physik, June) finds that when a radium preparation is cooled to the temperature of liquid air its radio-activity is reduced by more than one half. On heating again to the normal temperature a slight increase was observed. Elster and Geitel (Wiedemann's Annalen, November, 1899) find that the rays of radium convert a spark or brush electric discharge into a violet glow, acting sometimes at a distance exceeding one metre.

Becquerel Rays; Magnetic and Electrostatic Deflection.—Becquerel (Comptes Rendus, Dec. 11, 1899) finds that the rays known by his name when they pass along the lines of force of a powerful magnet are contracted to a focus. When the rays pass across the lines, after proceeding upward from the source, they curve round like projectiles and impinge upon the plate along a curve extending from one pole to the other and bending out of the way of the radiant substance in the center. These properties are analogous to those of cathode rays. The same writer (*ibid.*, Dec. 26, 1899) finds that the magnetic deflection of the rays is a property varying from one radiant preparation to another. Polonium preparations show no traces of it in the most powerful field, whereas radium shows very distinct mag-

netic deflection. The difference between Röntgen and Becquerel rays may thus be, after all, quantitative rather than qualitative. Absorption and magnetic deflection appear to be connected in some way. Curves obtained in photographic experiments show that the speed of propagation of radium radiation is of the order of the speed of rotation communicated by a magnetic field of about 4,000 units. This is probably very near the velocity found for cathode rays. Curie (Comptes Rendus, Jan. 8) shows that the behavior of Becquerel rays in a magnetic field varies according to the mode of preparation of the radio-active substance. Those that have most penetrative power are most easily deflected. M. and Mme. Curie (Comptes Rendus, March 5) find that the magnetically deflected rays of radium compounds resemble cathode rays rather than Röntgen rays, not only in magnetic deflection, but also in conveying a negative electric charge. Even after traversing a thick-walled leaden box covered with a piece of aluminum foil, and also an ebonite layer 0.3 millimetre thick, the rays conveyed a current of the order of 10^{-11} ampère through the galvanometer connected with the inclosed electrode. Strutt (Proceedings of the Royal Society, 66, March 3) attempts to compare the magnetic deflections of Röntgen, Becquerel, and cathode rays. He reports that with a field of 3,270 C. G. S. units no perceptible deflection of Röntgen rays is obtained, and that to produce a curvature of radius 1 centimetre in the rays would require a field of at least 60,000,000 units. Thomson has found that to produce the same curvature in cathode rays a field of only 315 units is required. Becquerel rays stand between Röntgen and cathode rays in this respect, a radius of 1 centimetre requiring 5,000 units. Dorn (Physikalische Zeitschrift, May 5), in experiments on the behavior of radium rays in an electric field, has shown that the rays always deviate toward the positive plate of a condenser, like cathode rays. The observed displacement agrees fairly well with that calculated on the supposition that the rays consist of electrically charged masses moving with great velocity.

Induced Radio-activity.—Rutherford (Philosophical Magazine, January) finds that thorium, besides ordinary Becquerel rays, continuously emits radio-active particles of some kind, which retain their powers for some minutes. This emanation ionizes gas in its neighborhood, and can pass through thin layers of metals and considerable thicknesses of paper. It is also unaffected by bubbling through water or sulphuric acid. It can not be vapor of thorium, for the emanation from thorium oxide was not sufficient to appreciably alter the pressure of the gas in an exhausted tube, and the spectrum of the gas was unchanged. The same writer (*ibid.*, February) finds that thorium compounds produce radio-activity in all solid substances in their neighborhood if the bodies are uncharged. With charged conductors the radio-activity is produced on the negatively charged bodies. In strong electric fields the radio-activity can be concentrated on the surface of thin wires. The radiation excited is homogeneous and more penetrating than the radiations from thorium or uranium. It is confined to the surface of the substance, and is independent of whether the substance is a conductor or not, and of the nature of its surface. The intensity of the induced radiation falls off in geometrical progression with the time, decreasing to half value in about eleven hours. With time of exposure the induced radio-activity at first increases nearly proportionally, but tends to a

maximum value. Mr. Rutherford suggests three possible explanations: (1) A kind of phosphorescence excited by the radiation; (2) deposition of the positively charged gaseous ions produced in the gas; (3) deposition of particles of a radioactive material emitted by thorium compounds. The first appears insufficient, and between the others the evidence is not conclusive, though the last seems somewhat more tenable. (See also *Röntgen Rays*, under ELECTRICITY.)

Magneto-optics.—Larmor (Cambridge Philosophical Society Proceedings, 10, 1899) points out that the Faraday effect may be deduced from the Zeeman effect by general reasoning, without introducing any special dynamical hypothesis. Voigt (*Annalen der Physik*, February) also has extended his magneto-optic theory, which involves very complicated formulæ. Reese (*Electrical World and Engineer*, Aug. 18) has attempted to determine whether the separation of the spectral lines in the Zeeman effect is strictly proportional to the strength of the field. Photographs show that it is very nearly so with sharp triplets, less so with sextuplets, and still less with diffuse triplets, the separation increasing less rapidly with the field when the latter becomes very intense.

Spectroscopy.—Beckmann (*Zeitschrift für physikalische Chemie*, Sept. 7) obtains colored flames for spectroscopic work by first forcing air through the pores of a porcelain tube impregnated with the salt to be examined and then passing it through a Bunsen flame. With aqueous solutions the necessary pressure is from 1.6 to 2 atmospheres, but with alcohol, acetone, or acetic acid it is only about half as great. Cantor (*Annalen der Physik*, March) finds by experiment that there is no perceptible absorption of the light from an electric arc by glowing gas in a vacuum tube. As by Kirchhoff's law the ratio of the emission to the absorption equals the emission of a black body at the same temperature, the glowing gases should have an extremely high temperature. But since they have not, Kirchhoff's law does not hold for electrically glowing gases.

Microscopy.—Deschamps (*Comptes Rendus*, April 30) has given the name telemicroscope to an instrument which enlarges by about 12 diameters objects placed at a distance of 25 centimetres. It thus enables the observer to study insects without disturbing them from their normal surroundings. The objective consists of two Dollond achromatic lenses separated by a distance less than the focal length of the most converging lens. The eyepiece is a lens of short focus, chosen so as to give the maximum enlargement and field. The depth of focus of the instrument is very great, and it gives effects of relief similar to stereoscopic effects.

Phototropy.—This name is given by Marekwald (*Physikalische Zeitschrift*, 1, 1899) to change produced by light when the removal of the active rays cause the substance acted upon to return to its original condition. A new example is afforded by chino-chinolin, whose yellow crystals become green in the light, but turn yellow again in the dark. Direct sunlight changes them in a few seconds; diffuse daylight in several minutes. The rate of return depends on temperature.

Electricity. Electrification.—Ebert and Hoffmann (*Annalen der Physik*, August) find that ice acquires a positive charge by friction with a metal and imparts a negative charge. The colder and drier it is, the greater this action. This may account for the electric effects of polar snowstorms, including atmospheric luminescence and even the aurora; and the phenomenon should be

allowed for in all experiments with liquid air, which usually carries minute particles of very cold ice suspended in its vapor. Campetti (Academy of the Lincei, July 15) finds that when a crystal of a salt is dropped into water, or into its own nonsaturated solution, the surrounding liquid becomes negatively charged, and the crystal positively charged. This he believes to be due to the fact that the negative ions fly off more rapidly than the positive. The resulting charges accelerate the outflow of the positive ions and retard the others, so that there is a tendency to equalization, but on the whole the liquid is negative to the crystal. The results of an investigation of the masses of ions undertaken by J. J. Thomson (*Philosophical Magazine*, December, 1899) suggest that the ionization of a gas consists in the detachment from the atom of a negative ion—the same for all gases—whose mass is only about $\frac{1}{187}$ of the mass of an atom of hydrogen. This negative ion may be the fundamental quantity in terms of which all electrical processes can be expressed. In an electrical theory embodying this conception the atom would be regarded as containing a large number of similar bodies, which Thomson calls "corpuscles." The mass of a corpuscle is about 3×10^{-27} grammes. In the normal atom this assemblage of corpuscles is electrically neutral. The electrification of a gas may be the detachment of a corpuscle from some of the atoms. The remainder of the atom forms the positive ion, and is of course of much greater mass. An atom might be split up indefinitely but for the fact that each detachment of a corpuscle increases the free positive charge of the remainder, and so increases the force of cohesion.

Dissipation of Charge.—Pochettino and Sella (Academy of the Lincei, July 1) conclude that the evaporation of a charged liquid does not dissipate the charge, thus confirming the conclusions of Schwalbe and controverting those of Pellat. When the surrounding air is kept dry the addition of water to a zinc plate reduces the rate of dissipation instead of adding to it. Elster and Geitel (*Annalen der Physik*, July) find that the dissipation of an electric charge is due to ions in the atmosphere, and that it is reduced by fog, smoke, and dust. It takes place equally for positive and negative charges, except at great altitudes, where the rate may be two to ten times greater for the negative than for the positive. The authors believe that the higher strata of the air are ionized by the sun's rays, the ultra-violet rays, which produce this effect, being reduced in the lower strata by absorption.

Continuous Discharge.—Toepler (*Annalen der Physik*, July) finds that there may be four different forms of continuous discharge in air—glow, brush, brush-arc, and flame-arc. Each may be either positive or negative. Usually an increase in the strength of the current brings about a change from glow to brush, and then to brush-arc. The author believes that so-called "globe lightning" or "ball lightning" is due to a continuous discharge analogous to the brush-arc, the way for which has previously been cleared by a discontinuous discharge of ordinary or "forked" lightning. The luminous globe is simply a portion of the continuous track where there is a particularly steep gradient of potential, and its motion may be due to electrostatic forces or to the motion of the air, carrying the whole track with it. Generally the phenomenon ends with another discontinuous or spark discharge, and the resulting detonation is ascribed to the "bursting" of the ball. The current intensity may be as high as 10,000 amperes, but usually does not

exceed 5 ampères, and probably a faintly luminous globe as large as one's head might be formed with a current as weak as 0.01 ampère. Leduc (*Éclair Électrique*, Oct. 28, 1899) reports that fine polished metallic points from 5 to 10 centimetres apart, at right angles to a photographic plate or glassy gelatino-bromide paper, and connected with an electrostatic machine, will, especially if the paper rest upon a piece of glass and this upon a plate of metal, produce an effluvia round the positive and a luminous globule at the negative point. When the globule has attained a certain size it detaches itself from the negative point (which becomes dark), and travels over the plate or paper, by a more or less irregular path, sometimes dividing as it travels, toward the positive point. When it reaches this, all luminosity is extinguished and the charges disappear as if the terminals of the machine had been connected by a conductor.

Discharge by Flame.—Villard (*Comptes Rendus*, Jan. 15) asserts that a flame placed in an electric field acts as a bundle of Röntgen rays, cutting the lines of force, and the gases produced by the combustion are active like Röntgenized air. In the absence of an electric field the flame is inactive and the gaseous products, transported into an electric field, produce no discharge. It is as if in ordinary air the incandescent particles gave out cathode rays, while in a field they gave out Röntgen rays; or rather analogues to these. This way of looking at the facts is believed by the author to explain a very large group of phenomena, including flame discharges, discharges by incandescent bodies and phosphorus, the radiations given out by electric sparks, especially from the cathode end, discharge by ultra-violet light, the Edison effect (current between the positive end of the filament of a glow lamp and an electrode fused into the lamp), and the production of ozone by flames, incandescent bodies, the electric arc and sparks, by the oxidation of phosphorus in the cold, and by radium.

Spark Discharge.—Ruhmer (*Elektrotechnische Zeitschrift*, Feb. 22) finds two distinct forms of discharge with a Wehnelt interrupter and a spark gap between a point and a disk. At large distances single strong sparks cross the gap, while at short distances a curved flame crosses from the point to the disk. At intermediate distances a large number of thin spark lines branch out from the point and extend toward the disk like a brush. Every one of the lines has a sinusoidal wave shape, due to a spiral form of the spark path. By chronophotography it is seen that the sparks are similar in outline, but are successively displaced in the direction of the disk. West (*ibid.*, Oct. 26, 1899) has made a photographic analysis of spark discharges from a Wehnelt interrupter by means of a "mutograph" in which the film moved continuously at a rate of 1 to 7 metres per second. The sparks traveled along approximately the same paths during successive discharges, but did not succeed each other regularly. Their diameter is not uniform, and they are frequently brighter in the middle than at the ends. Some of the sparks are double or multiple—an appearance due to several sparks in rapid succession, as shown by their tracks. Continuous current sparks do not show these doublings or branchings. Abraham and Lemoine (*Comptes Rendus*, Jan. 29) measure the duration of the electric spark by a method already devised by them to test for a retardation in the disappearance of the Kerr phenomenon. The total light emitted by the spark is less than 40 times that emitted during the cessation of the Kerr effect, and as this latter has been proved not to

exceed 0.01 micro-second, the spark probably does not last more than 0.4 micro-second.

Electric Arc.—Child (*Physical Review*, March) discusses Brown's discovery, made by photography, that the arc is formed by the coalescence of two light fronts, starting from the positive and negative carbons respectively, the positive one moving with the greater velocity. This is accounted for by the author on the supposition that the negative ions move more slowly than the positive ions—the reverse of what happens in the case of dissociation by Röntgen rays. The greater velocity of the positive ions would not only explain the fact observed by Brown, but also the greater fall of potential at the positive pole. Mrs. Ayrton (*Journal of the Institute of Electrical Engineers*, 28, p. 400), after many experiments to determine the cause of the hissing of the electric arc, concludes that it is caused by air coming in contact with the crater, and is due to the carbon's burning instead of volatilizing.

Electric Conduction.—Drude (*Physikalische Zeitschrift*, Jan. 6) states that the view that metallic electric conduction is due to the transportation of ions leads to a simple explanation of the optical characters of metals. If the current be regarded as due to the wandering of ions of constant mass and constant charge, there must be several kinds of these—two at least. As the result of a mathematical investigation, he concludes that the relative masses of the different kinds in a particular metal may be determined from its optical properties. In the case of nickel they are as 9.45 to 1. The same writer (*Annalen der Physik*, March) elaborates an electron theory of metals. It is not necessary, he thinks, to attribute ponderable mass to an electron in order to be able to attribute kinetic energy to its motion, and a certain inertia, as exhibited in the magnetic deviation of cathode rays and the optical qualities of metals. The absence of a ponderable mass attached to the electron makes it possible to bring metallic and electrolytic conduction under the same theory. The assumption that the ratios of charge to mass in the positive and negative electrons respectively are two absolute constants in all metals is not in agreement with the optical behavior of the latter. In gold and copper it is necessary to assume the presence of bound electrons, having a certain position of equilibrium in the body, and bound to the material particles. It is these bound electrons which play a part in optical processes. The author assumes the existence of different kinds of electrons with various charges, each a multiple of an elementary charge. These movable electrons or "nuclei" obey the kinetic theory of gases. Positive and negative electrons do not coalesce, owing to their high kinetic energy, as in the case of a comet which never returns to the solar system. The author investigates contact electricity and thermo-electricity, with the aid of his theory, and believes that all galvano- and thermo-magnetic effects may be explained and calculated with its aid. Lodge (*Philosophical Magazine*, May) suggests that conduction in the metals is due to passage of isolated charged corpuscles from one atom to the next. This does not cause any chemical change, because each atom on gaining one negative corpuscle loses a similar one. In electrolytes, however, the charged corpuscles drag their atoms with them, so that chemical changes occur. Reinganum (*Annalen der Physik*, June) finds that the ratio of the conductivities of a metal for heat and electricity respectively may be calculated from the electrochemical equivalent and the velocity of gaseous hydrogen atoms. He obtains thus the value

0.7099×10^{-10} , which agrees remarkably well with those found by experiment, such as that found by Jäger and Dieesselhorst for aluminum (0.706×10^{-10}). The author believes that the principles of the kinetic theory of gases may be applied also to liquids and to metals.

Resistance.—Lussana (Nuovo Cimento, August, 1899), in researches on the resistance of metals and alloys when immersed in oil and subjected to pressures up to 1,000 atmospheres, finds that with increasing pressure the resistance diminishes, tending to a minimum value at very high pressures. If sufficient time elapse between the compression and the measurement of the resistance—usually an hour—the curves taken with increasing and diminishing pressures are practically coincident. The coefficient is much smaller for the alloys than for the pure metals. The author concludes that the specific resistance of a metal depends not only on the proximity of the molecules, but also on their velocity of vibration.

Vacuum Tubes.—Wilson (Philosophical Magazine, June) studies potential gradient in a vacuum tube by means of a newly invented probe capable of being shifted to any part of the discharge. The discharge passes through a Torricellian vacuum, and an open glass tube containing the two electrodes floats on the mercury, whose surface can be raised or lowered by means of an India-rubber tube. Thus the vacuum tube proper floats up and down in the vacuum, and through a slit in its side the probes fixed into the side of the barometer tube are capable of entering. Among other results, the author finds a sudden drop of potential near the anode, often amounting to as much as 35 volts. He attributes it to the great rate at which positive ions are shot off from the anode. Phillips (Electrician, Sept. 29, 1899) finds that when the electrodes in an exhausted bulb are magnetized after the passage of the discharge at suitable pressure, the discharge being at the same time shut off, rotating luminous rings appear in the bulb in planes perpendicular to the axis. Kelvin (ibid., Aug. 4) explains these by supposing that after the current is shut off the space is filled for some time with negatively electrified particles, remaining scattered through the inclosure. Each of these must, during the initiation of the magnetic field, experience an electrostatic force proportional to its distance from the axis of the field, and in a direction perpendicular to the axis: This is just what is required to explain the rotating rings. Wien (Physikalische Zeitschrift, 1, 1899) has undertaken an investigation to see whether the radiated energy due to electric discharge in gases can be measured by the difference between the electric energy supplied to vacuum tubes and the heat produced in the tubes. The results show that within the limits of experimental error the electrical and heat energy are equal. Bouty (Journal de Physique, January) agrees with Wiedemann that a rarefied gas can not be regarded as a true electrolyte. He finds that the apparent conductivity of a rarefied gas is related to its luminescence, and is directly connected with a violent action that follows dielectric equilibrium, as the rupture of a stretched wire follows its elastic equilibrium when the stretching force exceeds a certain limit. The ether in a perfect vacuum possesses perfect dielectric elasticity, but gaseous molecules introduce weak points into it.

Cathode Rays.—Starke (Annalen der Physik, September) has attempted to measure the direct force exerted by cathode rays when they strike on light, movable bodies. The results of Riecke, who estimates the force from the motion of a propeller-shaped cathode, would show an amount of energy

surpassing the whole amount possessed by the rays, and such estimates are therefore inadmissible. The author used a fixed propeller-shaped cathode from whose blades the rays impinged upon suspended aluminum plates. The results were almost entirely negative, except that a very powerful influence machine gave a deflection indicating that the force to be measured is less than 10^{-4} dynes.

Röntgen Rays (see also *Becquerel Rays*, under LIGHT).—Graetz (Annalen der Physik, April) believes that the rotations produced in vacuum tubes under the action of cathode rays may not be directly due to the impact of projected particles, since they appear at low pressures before the cathode rays, and they cease at exhaustions at which these rays are still present. The author has also discovered that light dielectric bodies, under suitable conditions, rotate rapidly when exposed to Röntgen rays. Small spheres, bells, and vanes mounted on needle points in an electric field traversed by Röntgen rays continue to rotate while the rays continue, the direction depending upon the initial tendency. The rotations are strictly analogous to those described by Quincke in the case of liquids, and are covered by Heydweiller's theory. Trowbridge (American Journal of Science, June) has succeeded in generating Röntgen rays by means of a battery current, using 20,000 storage cells with an electro-motive force of more than 40,000 volts. The advantage of this method is the possibility of exactly regulating the current and difference of potential necessary to excite the rays, which is not possible with any other method. Zeleny (Philosophical Transactions, Nov. 9) determines the velocity of ions produced by Röntgen rays by comparing it directly with that of a stream of gas. In a field of one volt per centimetre the following velocities in centimetres per second were obtained:

MEDIA.	Positive ions.	Negative ions.
Dry air.....	1.86	1.87
Moist air.....	1.87	1.51
Dry oxygen.....	1.86	1.80
Moist oxygen.....	1.29	1.52
Dry carbonic acid.....	0.76	0.81
Moist carbonic acid.....	0.82	0.75
Dry hydrogen.....	6.70	7.95
Moist hydrogen.....	5.80	5.60

Campanile and Ciomme (Physikalische Zeitschrift, June 23) find that at all potentials the discharge of a condenser is accelerated by X rays, though they are more effective at lower potentials. Blythswood and Marchant (Proceedings of the [London] Royal Society, 65, 1899) show that the absorption of Röntgen rays produced by normal aqueous solutions of metallic salts having the same acid radical increases with increase of atomic weight of the base. Wind (Wiedemann's Annalen, August, 1899) denies that it follows from the low wave lengths obtained from diffraction images that the rays are really 3,000 times shorter than those of yellow light. He asserts that diffraction images like those obtained can also be produced by proper vibrations of any frequency, even that of ordinary light, if only these vibrations experience quite irregular changes of phase, with intervals between them corresponding to the frequencies resulting from the diffraction phenomena.

Dielectrics.—More (Philosophical Magazine, August), in opposition to the results of Röntgen, Quincke, and others, finds that no changes of volume and length are observed when dielectrics are placed in an electrostatic field. Bouty (Comptes Rendus, Aug. 20 to Sept. 10) has measured the dielectric cohesion of gases at various pressures by observing the value of the uniform

field between condenser plates, at which electricity first passes. He finds that hydrogen is a worse insulator than air or carbon dioxide at high pressures, but a better one at low pressures. Water vapor in itself (apart from deposited films of moisture) insulates perfectly. As between different gases, the critical value of the potential gradient has an absolute term that is nearly the same for all, and a term proportional to the pressure whose coefficient varies from gas to gas; but it does not seem to be related either to the mean free path or to the specific inductive capacity. The author attributes this discrepancy to the fact that other experimenters used systems of rigid recording levers which interpreted mere distortions as alterations in length. In his own observations he used optical methods.

Coherence.—Hürden (*Elektrotechnische Zeitschrift*, April 5) has constructed a coherer capable of observation under the microscope and consisting of two fine adjustable wires. When steel wires were approached to 0.006 millimetre from each other, while sparking under the action of electric waves, a dark bridge sprang across between them, and then the galvanometer indicated a current. Little particles of metal could be observed passing from the one wire to the other previously to the formation of the bridge, which was destroyed by shaking. Guthe and Trowbridge (*Physical Review*, July), from experiments on ball coherers, conclude that the high initial resistance of a coherer may be attributed to the presence on the surface of the metallic particles of a film (possibly of condensed water vapor) through which electrolytic action occurs. Balls of 3 to 10 millimetres diameter were used, of steel, lead, phosphor-bronze, and copper-plated steel. Bose (*London Royal Society*, Aug. 4) finds that contact sensitiveness to electric radiation differs with different chemical substances, and is a periodic function of the atomic weight. Continued radiation produces such a molecular change in the substance that it becomes less sensitive, whether the sensitiveness is in the direction of increase or diminution of resistance. In certain cases this diminution may go so far as to reverse the direction of sensitiveness. So-called "fatigue" appears to be due to the presence of radiation products.

Contact Electro-motive Force.—Lodge (*Philosophical Magazine*, May) maintains that contact force is due to the action of oxygen on the two metals. It is not necessary, he says, to assume any actual chemical combination, but only an extremely minute approach of the oxygen atoms toward the zinc, and a recession from the copper.

Hall Effect.—Moretto (*Nuovo Cimento*, April) finds that for strengths of field from 3,200 to 9,600 C. G. S. units the Hall effect is proportional to the strength of field, but that it diminishes proportionally to that strength as the strength further increases. The effect is approximately proportional to the current down to 0.04 ampère, but is relatively greater for lower intensities. The effect is of the same order of magnitude with discharge currents as with continuous currents. Marx (*Annalen der Physik*, August) has succeeded in finding an appreciable Hall effect in gases, which is contrary to the modern ionic theory. He used a flat Bunsen flame. The effect in electrolytes he believes will remain too small for measurement.

Electrostatic Inductance.—De Heen (*Comptes Rendus*, April 17) states that in certain cases a phenomenon of inductance comparable to that of electro-dynamics appears to be superposed on the ordinary phenomena of electrostatic influence.

If a charged conductor is caused to approach another conductor, or if the first conductor is charged or increased in potential, the second conductor becomes charged with electricity of the same kind, and with reverse motion the charge is of opposite kind. A conductor set in motion in the neighborhood of a second conductor tends to displace itself in the inverse sense of the communicated motion. Thus an oscillation of potential transmits itself to a distance very probably by inductance and not by influence.

Luminous Effects on Conducting Wires.—Borgman (*Comptes Rendus*, April 30) finds that a noninsulated metallic wire becomes covered with a luminous aureole when it is inserted in the circuit of an induction coil containing a spark gap or a vacuum tube. When the wire traverses a gradually exhausted tube, the luminous phenomena show a peculiar development. The aureole decreases in intensity, and is gradually replaced by a series of equidistant stars, around which luminous disks are formed with their planes at right angles to the wire. The number of stars and disks increases until the latter touch each other and fill the whole tube with a slightly stratified light. The approach of a magnet has the effect of inclining the plane of the rings. Tommasina (*Comptes Rendus*, May 28) notes that rhythmical crepitations may be heard along the "antenna" or radiating prolongation of one of the branches of a Hertzian primary. In the dark, mobile luminous *aigrettes* may be seen around the radiating wire, and appear to vibrate synchronously, not with the sparks of the oscillator, but with the movements of the interrupter of the induction coil.

Photo-electricity.—Buisson (*Comptes Rendus*, May 14) finds that sunlight causes a diminution in rapidity of discharge from an amalgamated zinc plate, and that this effect is not permanent. The potential of a plate also varies under the action of sunlight, a large number of metals becoming more negative after illumination, while platinum becomes more positive. In general a plate has two definite potentials, one in darkness and one in light, and there is an inversion wave length, such that more refrangible waves cause a negative variation of potential, and less refrangible ones a positive variation. For zinc this wave length is 0.310 μ .

Electro-photography.—Nipher (*Electrical Review*, Aug. 10), after exposing a photographic plate to the light of an ordinary room for several days, places it on a glass plate covering a metal plate that is connected to one electrode of an influence machine. A coin is connected to the other electrode, and in four to ten minutes an electro-photograph of the coin is made. Development is carried out by a moderate light. Schaffers (*Comptes Rendus*, April 2) has shown that images may be produced on a sensitive plate by an induction coil, using two needles as poles. The positive needle touches the plate, while the negative is about half a millimetre off the plate, and a sheet of metal below facilitates the action. The image consists of small black lines directed from the positive to the negative pole, and appears to be due at first to the fusion of the silver bromide and of the medium, and after prolonged action to the reduction of the bromide.

Magnetic Field produced by Motion of an Electrified Body.—Crémieu (*Comptes Rendus*, June 5) has repeated Rowland's experiments that indicate that an electrified body in rapid motion produces a magnetic field in its neighborhood. He has examined the inductive action of a revolving charged disk upon a neighboring circuit, and

concludes that the motion of an electrified body does not appear to produce any magnetic effect in its vicinity.

Magnetism. *Theory.*—Lang (Annalen der Physik, July) interprets the so-called "amperian" molecular currents as convection currents produced by the revolution of negative electrons as satellites around the heavier positive electrons. The usual velocity is that of light, and if it becomes larger the satellites may change the electron around which they revolve.

Magnetization.—Maurain (Comptes Rendus, Aug. 13) finds that on electrolyzing a solution of ferrous sulphate in sodium pyrophosphate inside a magnetizing spiral adherent brilliant magnetized deposits of iron are obtained, the intensity of whose magnetization is constant for the different layers of the deposit, but is greater as the field in which it is obtained is stronger. The coercive force is enormous, and the reversal of the magnetization may be effected suddenly for a very small variation in the field.

Hysteresis.—Sheldon (Electrical World and Engineer, Feb. 10), to test the supposition that the retentivity and coercivity of magnetic substances (the two factors of hysteretic quality) might be dependent on the distance between their molecules, experimented with different arrangements of compass needles. When these were placed in line the magnetizing force required to break up the arrangement decreased as the distance between the pivots of the needles increased. The decrease does not become zero, however, but approaches a constant value. When the needles are arranged in multiple rows the polarity is more easily reversed owing to the influence of the rows on each other. As the distance between the rows is increased, the critical magnetizing force is increased, because the demagnetizing influence of the rows on each other is decreased.

Loss of Electric Charge.—Phillips (Royal Society Proceedings, 65, 1899) finds that under certain conditions an electrified body loses its charge in the neighborhood of a magnetic field. This only occurs at pressures below 0.2 millimetre of mercury.

Effect of Field on Fluids.—Jäger (Vienna Academy Sitzungsberichte, 108, 1899), in experiments on the behavior of fluids in the magnetic field, could not observe the least change in the capillarity constant of a liquid in a powerful field. Theory indicates, however, that when such liquid is a solution in a nonmagnetic solvent a change in vapor tension must occur, accompanied by a calculable potential difference. An attempt to confirm this experimentally was indecisive.

Effect on Elasticity.—Stevens and Dorsey (Physical Review, August, 1899), in experiments on the effect of magnetism on the elasticity of rods, find that the modulus of elasticity of wrought iron and steel increases with magnetization. In the case of steel little difference was observed for loads of 1 kilogramme and $\frac{1}{2}$ kilogramme, but in wrought iron the smaller load gave the greater displacement when equal magnetizing forces were used.

Diamagnetism.—Meyer (Annalen der Physik, April), noting the fact that in some diamagnetic compounds the molecular magnetism shows a greater diamagnetic value than would correspond to the sum of the atomic magnetisms, and that this is so in every case where the combination is accompanied by considerable expansion, has investigated increases with magnetization. In the case of contraction. Measurements made on copper salts show that expansion emphasizes the diamagnetic character of a substance, and contraction emphasizes its paramagnetic character. The magnetic properties of the elements can therefore only be

obtained from the elements themselves, or from compounds whose formation entails no change of volume.

Instruments.—Du Bois (Zeitschrift für Instrumentenkraft, April and May) describes a new form of his magnetic balance, for which he claims an accuracy five times that of the original type. The most important improvement lies in a compensation coil wound outside the main exciting coil, which neutralizes the stray field between the test rod and the outer windings.

Miscellany. Range of Observable Phenomena.—Stoney (Dublin Royal Society, 9, p. 79) classifies the various measurable distances as stellar distances, planetary intervals, laboratory measures, and molecular quantities. Each stands to the next in the ratio of 10^9 to 1. Light, by its wonderful speed, brings within our grasp the enormous distance of the first group, and also brings us into touch with extremely minute intervals by the smallness of its wave lengths. A further subdivision is, to us, meaningless, and hence the known universe is comprised between the limits of ultra-stellar remoteness and infra-molecular proximity. Large as the range is, it might be infinitely larger in both directions, and it resembles an absorption band in a spectrum, representing the small portion of the material universe accessible to human faculties.

PHYSIOLOGY. Respiration.—In experiments by Dr. H. Wendelstadt, of Bonn, on the action of alcohol upon respiration, a small gasometer was closely applied to the mouth, while the subject was lying down, for ten minutes, and the quantity of air breathed was read off every ten seconds. The number of respirations was also counted in some of the later experiments. The temperature of the room was kept as nearly as possible at 65° F., and the experiments were conducted partly in the morning, when no fatigue had been undergone, and partly on subjects who were more or less exhausted after muscular or mental effort. Wine or pure alcohol mixed with sweetened lemonade was administered in moderate doses. In most cases much drowsiness or even heavy sleep was induced. The general results obtained in men who were not fatigued were that in one experiment there was no alteration in the volume of air respired, in 9 experiments there was a diminution, and in 54 cases there was an increase after the use of alcohol, but with much individual variation. In 29 cases in which pure alcohol was ingested, 7 showed diminution of respiratory activity, but when the alcohol was taken in the form of wine only 2 showed such diminution, while the amount of increase in every case where it occurred was greater. The difference, Dr. Wendelstadt thinks, is attributable to the presence of ethereal oils in the wine giving it its bouquet. It should be borne in mind that, although it has been found that the administration of 100 cubic centimetres of pure water does not augment the volume of respired air in a given time the same quantity of water with sugar and lime juice causes, at least in some instances, a slight increase. In persons who are exhausted by fatigue, the effects of alcohol in causing an increase in the volume of air breathed are much more marked. Since in febrile and debilitated states of the body the condition of the nervous system resembles that of a person exhausted by fatigue, Dr. Wendelstadt's experiments may be regarded as corroborating the conclusions arrived at by most clinical observers, that in such conditions alcohol is the best stimulant that can be given.

Dr. Leonard Hill, having subjected cats and dogs to conditions of atmospheric pressure similar to

those to which workers in deep bridge caissons are exposed, found that under rapid increase of pressure amounting to two atmospheres and rapid diminution to ordinary pressure no effects occurred beyond slight increase of the respiratory oscillations and slightly diminished frequency of the pulse. He therefore regards the mechanical congestion theory of caisson disease as untenable. But how, the *Lancet* asks, does he explain the hæmorrhages from nose and ears that have been observed when the pressure is too suddenly released?

Experiments on the temperature of the animal body during fasting and the rate of assimilation of carbohydrates conducted at the University of Genoa and described by Prof. Ugolino Mosso are particularly interesting in that they establish the efficacy of sugar in raising the temperature of an animal when it has fallen during a period of fasting. From one to four grammes of sugar per kilogramme were found to cause a rapid rise of temperature in the first ten or fifteen minutes; in from one to two hours the temperature reached a maximum, and remained constant or elevated for an interval of time varying with the amount of sugar introduced. The effect of sugar is most marked after a long fast, when the temperature is lowest. The action of bread is in some respects opposite in character. The temperature rises more slowly after the introduction of bread than after sugar, and the rise in this case is most rapid for animals whose period of starvation has been short, and whose temperature is not too low.

Circulation.—In continuation of his researches on the physiology of the mammalian heart, J. A. McWilliam has studied the influence of chloroform on the rate of heart beat, with observations on the effects of asphyxia. The general effect of chloroform upon the pulse of the cat appeared to be the same as in man—first, a stage of acceleration, and then one of moderate or slow rate. It was found that: 1. During relatively light anaesthesia there might be (a) a brief phase of slowing, followed usually by acceleration, or (b) acceleration without primary slowing; and convulsive movements were marked. 2. With deeper anaesthesia acceleration was the rule, associated with respiratory effort and diffuse motor excitation. 3. In still deeper anaesthesia there might be no change in pulse rate for a time, and the slowing convulsive movement was absent or slight and late in development. The acceleration was essentially due to diminished activity of the vagus center, and was marked only when contraction of skeletal muscles was excited. Slowing depended mainly on increased activity of the same center, but in the final phase there was direct influence on the heart itself.

The results of systematic observations on the conditions of students participating in athletic games have been published by Prof. Alfred Stengel, M. D., of the University of Pennsylvania, and an account of similar studies with students of the University of Cambridge is given by Prof. Clifford Allbutt in the fifth volume of his *System of Medicine*. Important agreements and a few differences appear in the conclusions reached by these authors. By percussion and auscultation Prof. Stengel was able with a brush dipped in oil to map out on the surface of the chest the borders of the heart, the mid-sternal line, the episternal notch, and the outlines of the upper ribs. The lines thus obtained were transferred to tracing paper applied to the chest, and were thence reproduced on drawing paper. In watching the effects of training attention was first drawn to the ease and frequency with which a soft systolic murmur was found to develop over the heart. In a special

trial of 9 football players in the summer, the prompt development of a very evident cardiac murmur after a little exertion was noticed. But during the succeeding autumn term the same men, tested under similar conditions, gave no evidence of cardiac murmurs. In one young man an extension of the cardiac limits was observed after a half-mile race. The left border of the heart was displaced to a point somewhat beyond the nipple line, and the right border to a distance of about two thirds of an inch beyond the corresponding edge of the sternum. After the race a diffused thrill was felt over the apex of the heart and in the epigastrium, which was confirmed by auscultation, and the second pulmonary sound was distinctly heard. In the case of a half-mile runner, twenty-two years of age, in whom the heart sounds before the race were normal, a distinct systolic thrill at the apex of the heart was perceived at the conclusion of the race. A trained walker, twenty-three years of age, in regular "form" for three years, showed an increase of the first sound of the heart, together with a puffing systolic murmur after the race. The right border of the heart underwent no displacement in this case, but the left border was displaced to the nipple line after exercise. The author is of the opinion that a preliminary overdistention of the right side of the heart occurs after exercise, and is attended with a certain amount of discomfort or distress; but this eventually subsides when the athlete is said to have recovered his "second wind." This conclusion, reached independently by him, is substantially the same as that arrived at by Dr. Allbutt. Dr. Stengel finds, further, that the pulmonary arterial murmurs (heard in the second intercostal space) are due to a dilatation of the artery prior to its bifurcation, and are almost habitually present in young boys after exertion. A distinct pulsation is likewise often felt in this situation. The cardiac systolic murmurs are, as a rule, due to mitral regurgitation, but others are possibly of cardio-pulmonary origin. Certain remote after-effects are also mentioned as appearing in middle-aged persons who have indulged freely in athletics during youth. The author concludes that overdistention of the heart is frequent as a result of athletic contests, and may cause harm if the person is in ill health or badly trained, and that permanent hypertrophy with symptoms of palpitation or distress are results not seldom met with.

Having determined the percentage oxygen capacity (between 16 and 21 in healthy men) and the total oxygen capacity, J. S. Haldane and J. Lorraine Smith computed the total volume of the blood by calculation from the total and the percentage oxygen capacities, and the total mass by multiplying the volume by the specific gravity (about 1.055). The results of a number of experiments on healthy persons showed that the commonly accepted estimate of the mass of blood as one twelfth of the weight of the body is much too high, the average found being only about $\frac{1}{16}$ of the weight without clothes. As a general rule, the mass of the blood (in proportion to body weight) was found to be greater as the percentage oxygen capacity was less, so that the total oxygen capacity (or the total amount of hæmoglobin) is relatively constant. Applying their method to special affections, the authors found that in chlorosis the total oxygen capacity was maintained at approximately the normal amount, while the percentage oxygen capacity diminished (for example, below 50 per cent.), and the volume of the blood was increased to a marked degree. The decrease in the number of red corpuscles and the amount of hæmoglobin could not be regarded as due simply to

increase in the plasma. In pernicious anæmia the total oxygen capacity was diminished in a marked degree as compared with the normal, as also was the percentage oxygen capacity. The volume of the blood was markedly increased. The decrease in the number of red corpuscles and in the amount of hæmoglobin was greater than could be explained by the increase in the volume of the blood.

In his Hunterian lecture on The Effects of Influenza upon the Heart and Circulation, Dr. Sansom noticed as the chief disturbances observed the rapid heart, cardiac dilatation, the irregular heart, the slow heart, and pain in the heart, all following or dependent upon the influenzal infection. In connection with the rapid heart other phenomena were observed, such as those associated with Graves's disease and flatulent dyspepsia, accompanied in some cases with dyspnœa and a sense of failing heart. These disturbances were termed by the author "vagus storms." They seem to involve all the tracts supplied by the pneumogastric nerve, but in some cases one area disproportionately to the others.

It was found by Dr. F. W. Mott and Dr. W. D. Halliburton in experiments on anesthetized animals that the cerebro-spinal fluid, removed sometimes after death and sometimes by lumbar puncture during life from cases of brain atrophy, and especially from patients suffering from general paralysis of the insane, caused when injected into the vessels a fall of arterial pressure with but a trifling effect upon the respiration. Chemical examination of the fluid showed that it contained nucleo-proteid and choline, and further experiments demonstrated that the effect on the circulation was due to the choline. The authors found every reason to believe that choline proceeds, like the nucleo-proteid, from the acute disintegration of the brain tissue, and they think that some, but not all, of the symptoms of general paralysis are due to auto-intoxication, nucleo-proteid and choline contained in the cerebro-spinal fluid being absorbed into the blood. In accordance with this the authors have found choline in the blood of general paralytic patients drawn by venesection. When from 1 to 10 cubic centimetres of solutions of choline containing 2 parts in 1,000 were injected into the vessels, a temporary fall of blood pressure occurred, due partly to the action on the heart, but chiefly to dilatation of the peripheral vessels of the intestinal area. Choline has little or no action on the nerve trunks, as tested by their electrical response to stimulation. It was found that intravenous injection of stated proportions of neurine solution caused a fall of arterial pressure followed by a marked rise and a subsequent fall to the normal level. The typical effects of neurine are still obvious after the removal of the influence of the central nervous system by section of the spinal cord or of the splanchnics. But after the action of the peripheral ganglia has been cut off by the influence of nicotine, neurine produces only a fall of blood pressure. It hence appears that the constriction of the vessels is due to the action of the drug on the ganglia. Section of the vagi had no influence on the results of injecting either choline or neurine, and there was no evidence that either base acted directly on the cerebral vessels. Unlike choline, neurine is intensely toxic to nerve trunks. The authors confirm the statement of Corvello, that neurine acts like curare on the nerve endings of voluntary muscle, and that the cessation of respiration is due to this action.

The ferrocyanide method of determining the oxygen capacity of the hæmoglobin of the blood described by John Haldane depends on the fact that combined oxygen is liberated rapidly and

completely on addition of solution of potassium ferrocyanide to laked blood, and may be easily measured. The author affirms that when the fallacies due to incomplete laking of the blood and to the presence of bacteria are eliminated, the method gives exact results.

Mr. W. H. Thompson, having studied the effects of the intravascular injection of peptone and albumose, has shown that the vessels of the kidney and limbs are but slightly affected, while those of the spleen undergo moderate, and those of the liver considerable, stimulation coincidentally with the fall of blood pressure.

Digestion.—The problem of the process by which the materials ingested into the stomach and intestinal canal are absorbed, concerning which various explanations have been offered, is the subject of a memoir in the Philosophical Transactions by Prof. E. Waymouth Reid. The experiments were performed on anesthetized dogs. Two loops of intestine of equal length were withdrawn from the abdomen and covered during the whole duration of the experiment with cloths wrung out of warm water. The materials injected were solutions of serum, peptone, and sugar at the temperature of the body. The main results of the author's inquiry are stated in the propositions that a physiological activity of the intestinal epithelium is demonstrated, first, by the adsorption capable of being effected by the animal of its own serum or even plasma under conditions in which filtration into blood capillaries or lacteals, osmosis, or absorption, are excluded; and, second, by the cessation or diminution of the adsorption of serum when the epithelium is removed, in spite of the fact that removal must at any rate increase the facilities for osmosis and infiltration. The word "adsorption" is used by Prof. Reid in the sense of "a simple soakage with some degree of assimilation, a sort of dyeing of the gut membrane" with the solutions. The state of nutrition of the cells is regarded as the main factor in their activity, and this is intimately associated with the blood supply. The activity of the cells was characterized by a slower uptake of the organic acids of the serum, and a rather quicker uptake of the salts, than of the water. No evidence of the existence of specific absorptive fibers in the mesenteric nerves was obtained. The bile did not have a stimulant action on the cells. Weak alcohol acted as a stimulant without any concomitant increase of blood supply being shown. Distilled water was found in the course of the experiments to act very deleteriously upon protoplasm, a simple washing out with it causing detachment of the epithelial cells. It appeared in experiments made with those substances that the chief factor in the absorption of peptone was an assimilation (or "adsorption") by the cells, and in the absorption of glucose, diffusion variable according to the permeability of the cells.

From a research upon the digestibility of some nonnitrogenous constituents of certain feeding stuffs, G. S. Fraps finds that sugars occur in all feeding stuffs; that they are completely digested as a rule; and that their determination is of especial importance in the case of hays and cottonseed meal; that the average digestibility of pentosans in 34 samples is 64.2, and the average for timothy hay (8 samples) is 53.9. The constituents of the nitrogen-free extract may be arranged in the following order, according to their digestibility: (1) sugars; (2) starch; (3) pentosans (bodies which on hydrolysis yield pentose sugars); (4) residue. The pseudopentosans of crude fiber are less digestible than the residue.

The residue is sometimes more, sometimes less digested than the nitrogen-free extract. Crude fiber may be changed during digestion so as to appear as nitrogen-free extract in the excrement. The determination of sugar, starch, and pentosan is more important than that of crude fiber.

The observations of V. Harley indicate that the digestive power of pepsin is not affected by dry heat—that is, by three hours' exposure, at 100° C., over sulphuric acid. The action of heat on pepsin in solution is very different, however, a temperature of 82° C. in the experiment described causing its destruction. At temperatures below 75° C. the disaggregation of fibrin was complete in twenty-four hours, but at 81.5° C. the fragments of fibrine were only softened superficially; and at 82° C. the pepsin had no effect whatever, even after twenty-four hours.

In 1898 (see Annual Cyclopædia for 1898) Dr. Carl Schlatter, of Zurich, reported a case of complete extirpation of the stomach, and proved from the physiological condition of the patient several months afterward that only the slightest effects on the function of digestion had followed the operation. He has more recently described a case of resection of about six feet of the small intestine without the patient suffering serious injury. The patient was an Italian who had been stabbed in a brawl, and was found, upon examination about nine hours afterward, to have a protrusion of the bowel, the exposed part of which was already dying. The affected part was cut out, and the ends of the other parts were sutured together. The patient rallied fast, and steadily improved in health and weight, so that he left the hospital in good condition. The chemical examination of his diet and excretions showed that the percentage of absorption of nitrogen was fully up to the normal, but that there was a greater loss of the fat in the food than should have occurred in health. His subsequent history, however, was not quite so favorable. Eight months after the operation his weight had decreased, and he was not able to tolerate the solid food to which he had previously been accustomed. Yet, while he felt unequal to much work, he was regarded as on the whole in a very fair condition.

In his Hunterian lectures on the Surgery of the Stomach, Prof. Mayo Robson has more fully shown that large portions of the stomach may be excised, or even the whole removed, with no very great mortality, and in successful cases with little effect upon the patient's digestion. In the present opinion of the medical profession the stomach hardly occupies so important a position in digestion as it formerly held. It is now regarded as rather a preparer for the exercise of the digestive powers of the pancreas than as itself an active digestive agent. One of its functions is to render innocuous many of the micro-organisms which enter with the food.

The relation of the cell to the enzymes or soluble ferments which originate from cells was touched upon by J. Burdon Sanderson in the address he delivered before the International Medical Congress at Paris. Formerly, the speaker pointed out, each kind of cell was regarded as having a single special function proper to itself, but the progress of investigation has shown that each species of cell possesses a great variety of functions, and that it may act upon the medium which it inhabits and be acted upon by it in a variety of ways. Thus, for example, the colorless corpuscles of the blood (or, as they are now called, leucocytes) are considered not merely as agents in the process of suppuration or as typical

examples of contractile protoplasm, but rather as living structures possessing chemical functions indispensable to the life of the organism. Similarly, the blood disk, which formerly was thought of merely as a carrier of hæmoglobin, is now regarded as a living cell possessed of chemical susceptibilities which render it the most delicate reagent that can be employed for the detection of abnormal conditions in the blood. The tendency of recent research is to show that the reactions referred to as chemical functions of the cell (action of the cell on its environment—actions of the environment on the cell) are the work of ferments, which are products of the evolution of the living cell, and therefore to which the term enzymes may be applied. Recent researches have plainly indicated that in the case of the disease-producing micro-organisms the specific functions which for years were regarded as proper to, and inseparable from, the cell, belong essentially to the enzymes which they contain. It has been further shown that similar statements can be made as regards ferment processes which differ widely from each other, and no less widely from those induced by bacteria. So that in the domain of microbiology the enzyme may in a certain sense be said to have "dethroned the cell."

In the first part of his Microscopic Researches on Glycogen, published in 1896, Dr. Charles Creighton gave the details of his observations on the character and functions of glycogen in the embryos of mammals, and showed how he had been led to regard it as the precursor, the temporary substitute, or the accessory of red blood. In the second part of the memoir, published in 1899, he has described the distribution of glycogen in the invertebrates, the mode in which and the period when it is deposited in various examples, and has developed the view which he has been led to adopt. The solid carbohydrate starch or its modification is regarded as the blood of vegetables, and in the author's opinion glycogen or animal starch is co-ordinate in value with the blood or lymph of animals. He finds it not unreasonable to look upon starch as a fixed instead of a fluid nutriment. A substance resembling starch in composition but differing from it in giving a red reaction with iodine, has long been known, and evidence is adduced from the observations of chemists and biologists showing how much attention has been given to the subject, and how wide is the distribution of animal starch. It has been found in protozoa, less distinctly in coelenterata and worms, very clearly in the chief families of mollusks, and in arthropods. In the higher mollusks, which have been the special object of the author's investigations, it is accumulated around the vessels and is contained in the large plasma cells, around those of the nerve centers and of the digestive and nerve tracts, or exactly in those parts which are nearest to the sources of supply and those in which the most active processes are taking place. In the arthropods it is also found in the organs of reproduction, as well as elsewhere, at certain stages of development. The plasma cells in the mollusks mentioned here, with their contained zo-amylase, occupy the position of the vascular sheaths of the vertebrates; and as the tissues in the vertebrates derive their pabulum from the lymph which circulates in the perivascular sheath, so the tissues of the mollusca draw their nourishment from the carbohydrate stored up in the plasma cells. In the vertebrates the original vascular system of the molluscan series no longer contains a lymphlike fluid, but is filled with red blood.

M. Bouchard reports to the French Academy of

Sciences having found that an animal gorged with fat and then deprived of food may still gain in weight, the increase resulting from the oxidation of the fat, which is transformed into glycogen and accumulates in the muscles instead of in the liver.

J. Skegen has found reason from results of experiments with liver extract to believe that the proteids undergo a disintegration in the liver which leads to the detachment of a molecule of a sugarlike substance containing nitrogen, and this by the action of a liver ferment undergoes further changes terminating in the production of glycogen. Similar conclusions have been arrived at by Dr. Berkhart Schoendorff, while M. C. Bouchard and M. A. Desgrez have satisfied themselves that muscle glycogen can be formed in the body from incompletely oxidized fats. The experiments of R. Cohn render it probable that glycogen can be derived from leucine, and Dr. Martin Jacoby has pointed out that there are probably many ferments in the liver.

Secretion.—Physiologists have not been agreed as to whether a connection exists between the lymphatic and the blood vascular systems. A number, including Mascagni, Haller, and Cruikshank, have denied the existence of such connection except with the large veins in the neck, while a considerable number of others have observed cases in which the lymphatics directly opened into the venæ cavæ, the portal, renal, axillary, and internal iliac veins. Mr. Cecil H. Leaf has now recorded in the *Lancet* other examples of connection between the lymphatic and venous trunks, and has further shown that a direct communication exists between the small arteries in the thorax and the lymphatic vessels in that region, although the connection is not so free as between the lymphatics and the veins. It has been known for some time, he says, that the lymph often assumes a pink or reddish hue, and the color has been shown to be due to the presence of red blood corpuscles. "How do the corpuscles pass into the lymphatic vessels? If the fact already mentioned is admitted—viz., that a certain number of small arteries pour their contents directly into lymphatic vessels—the presence of these corpuscles is readily explained, and another factor is present which would materially quicken the movements of the lymph. However, it is only right to add that the arteries apparently do not communicate directly with the lymphatics nearly so frequently as do the veins. If the communications between the veins and lymphatics can be shown beyond a doubt to take place all over the body—and already they have been observed to exist to a very considerable extent—it follows that we ought to regard the venous system as a part, and that no inconsiderable part, of the absorbent system.

On examining the extract of the adrenal capsules Mr. John Abel found that by the employment of benzoyl chloride and a 10-per-cent. solution of soda he was able to extract a peculiar substance which is present in the proportion of about 1 part in 10,000 parts of the gland substance, to which he gave the name of epinephrin. This substance is a base which has a bitterish taste and produces a slight local anaesthesia. Its formula is $C_{17}H_{19}NO_4$. It is precipitated from its acid solutions by picric acid. The author found that when solutions of the salts of epinephrin are applied to the normal conjunctiva or to one which by stimulation is more or less congested, the vessels immediately contract and the contraction persists for a long time. The same holds good for other mucous membranes. It should be observed, however, that this is true only of the salts of epinephrin, and that the base itself has very slight, if any, physi-

ological properties. The salts when injected into the veins cause great and persistent increase of blood pressure. They first excite and then paralyze the respiratory centers. At a later period, and when the substance is given in larger doses, the heart is paralyzed. Evidence has now been obtained that the blood returning from the adrenals also contains the substance that raises the blood pressure, and that this is not present in the blood of any other part of the body. Its formation appears to be under the influence of the splanchnic nerves, which may thus be regarded as containing secretory as well as vaso-dilator fibers. Electric stimulation of the splanchnic nerves occasions an increase in the production of epinephrin. The author further considers the relations of epinephrin to Addison's disease.

A contribution to the discussion of the theory of Horbaczewski, that uric acid is derived from the disintegration of proteids containing nuclein, notably of the leucocytes, is made by Dr. Carstairs C. Douglas, of Glasgow, from the results of 95 simultaneous quantitative determinations made upon 7 persons in good health and 35 persons suffering from various diseases. The author concludes that on the whole there is a discrepancy between the amount of uric acid thrown off from the body and the number of leucocytes, and his observations do not support the view that normally the source of uric acid is found in the nuclein of the leucocytes. His analyses showed, among other things, that uric acid varies much less with diet than does urea.

The results of an investigation described by Francis W. Goodbody go to show that sodium salicylate causes an increase in the quantity of urine excreted and in its specific gravity. The latter increase is ascribed principally to the augmented elimination of the nitrogenous substances, especially of the urea. It was further observed that sodium salicylate causes an increased breaking up of proteids in the body, and that it has no influence on general metabolism so far as absorption of the proteids and fats is concerned, notwithstanding its known cholagogue action.

Assuming that in plants and the lower animals the simple inorganic compounds of phosphorus are used in the synthesis of the nucleins, and an investigation by one of the authors having shown that a similar synthesis is effected in fishes, Noel Paton, J. C. Dunlop, and R. S. Atchison have undertaken an investigation of the progress of such synthesis in mammalia—of which little is known. As a preliminary to the study of the metabolism of phosphorus a knowledge of its channels of absorption and secretion was required. Carrying on their studies upon the dog and the goat, the authors found that in the normal condition, with the animal in phosphorus equilibrium, the absorption and excretion of phosphorus by the intestines were equal. During lactation in the goat the excretion of phosphorus by the bowel was diminished to meet the demands of milk formation; while in the dog during lactation a diminished excretion of phosphorus in the urine was remarked. The milk of the goat contained a very high proportion of phosphorus, while the percentage of organically combined phosphorus was lower than in the milk of the human subject or of the cow. The administration of the soluble glycerophosphate of lime by the mouth causes no increased excretion of phosphorus in the urine of the dog and in the urine and milk of the goat.

The general conclusion from a discussion in the British Medical Association of the origin of uric acid, in which Prof. W. D. Halliburton,

Prof. D. Milroy, Dr. Alexander King, and others participated, appears to have been that it is double, a part of the acid being the result of the disintegration of the nuclein taken in with the food, and another part proceeding from destructive changes of the nuclein contained in the body; or, as Prof. Halliburton expressed it, part of exogenous and part of endogenous origin. The latter portion is derived from the metabolism of the leucocytes that are so abundantly formed after the ingestion of food.

The research of Prof. A. Herzen, of Lausanne, into the function of the spleen is reviewed in the *Lancet* by Henry T. Bellamy, who finds that from the bulk of the evidence collected by M. Herzen there is little room for doubt that, apart from the hæmatopolitic and possibly allied functions possessed by the organ, it furnishes a product of "internal secretion" which causes in the pancreas the transformation of its inert zymogen into active trypsin.

After a long series of experiments and observations, E. O. Hultgren and O. A. Anderson report that extirpation of the suprarenal capsules in cats, dogs, and rabbits occasioned death within a week or ten days. Removal of an organ on one side was followed by the animal becoming thin for a short period. Retention of a small fragment was found sufficient to preserve life, but when both organs were removed death supervened, with great fall of temperature. The metabolism of albumin, the quantity of hæmoglobin, and the number of the red corpuscles were not affected. Injections of small quantities of adrenal extract caused temporary improvement, but when large quantities were injected death occurred in the rabbit from œdema of the lungs. Injections of extracts of adrenals of rabbits, guinea pigs, cats, rams, and steers caused rise of temperature in rabbits, while injection of adrenals of sheep, oxen, and pigs usually caused fall in temperature.

Muscular System.—The physiological effects of creatin, a normal constituent of flesh, and one of the principal constituents of most meat extracts, and of creatinin, its anhydride, a normal constituent of human urine, and the value of those substances as nutrients have been investigated with much pains by Prof. J. W. Mallet. From his experiments the author draws as his main conclusion that by far the larger part of the flesh bases ingested, if not absolutely the whole, does not undergo metabolism with the production of urea or anything else, but, on the contrary, is eliminated by the kidneys. In the case of creatinin it is excreted unchanged, while creatin is changed wholly or very largely into creatinin. The fact of the quantitative recovery of creatin and creatinin from the urine evidently accords fully with the generally accepted belief that these substances can not serve to build up proteids, and are therefore not to be classed among tissue-forming food materials. On the whole, the investigation is unfavorable to the idea of the creatin of living muscle being the antecedent of urea in nitrogenous metabolism. Admitting that it is still an unsolved problem what nitrogenous substance or substances may properly be regarded as intermediate between muscle proteids and urea, it may fairly be considered established for nutrition investigations that the so-called flesh bases creatin and creatinin occurring in food may be entirely disregarded as sources of energy. In the discussion of the results of analyses of meat and forms of food prepared from it, such as soups and the like, it is evidently wrong and misleading to confound together, under the

head of protein or proteid materials, the proteids proper, capable of building up the nitrogenous tissues of the living body, and of furnishing muscular heat and energy by oxidation, and these so-called flesh bases, which, taken in along with food, are not available for either of these important purposes. Even if viewed in the light of nerve stimulants only, and thus to be classed with tea and coffee as adjuncts to food rather than as true food itself, meat extracts, so far as the flesh bases creatin and creatinin are concerned, are shown by the investigation to be very much less active as to their effects upon the nervous system than they have been commonly reported.

Experiments made by Prof. Angelo Mosso with his ergograph indicate that in soldiers after forced marches the power of the muscles of the arm and the hand is diminished; so that, as Ioteyko has observed, while moderate exercise of the psycho-motor centers produces increased activity of both sensory and dynamogenic centers, exhaustion of one center, such as that affecting movements of the lower limbs, causes depression of all centers, and has a tendency to become generalized. Prof. Mosso suggests that fatigue is due to some toxin entering the blood current.

Dr. William Ewart, in a lecture on Some of the Mechanism of the Heart and its Valves, dwelt upon the presence of a supra-papillary and a retro-mitral space in the ventricle. He showed that during contraction the posterior or mitral flap is thrown into pleats, admitted a powerful ventricular aspiration, and declared his agreement with those who accept a muscular and a valvular element in the first sound.

Investigations by Dr. J. L. Bunch on the innervation of the muscular coat and the vessels of the intestine go to show that these parts are supplied by the splanchnic nerves, which contain both constrictor and dilator fibers derived primarily from the spinal cord, and that in dogs they leave the spinal cord by the anterior roots of the post-cervical nerves from the second to the sixteenth, the higher roots containing a larger percentage of dilator fibers, the lower roots of constrictor fibers.

In his Croonian lecture on Degeneration of the Neuron, Dr. Frederick Nott expressed himself in favor of the view that the terminal arborization of the axis-cylinder process of one neuron does not anatomically fuse with the cell body and dendrons of another, and that trophically and genetically the two are independent; yet that there is a physiological connection between adjacent neurons. He also pointed out that the integrity of the sensory moiety of a reflex is almost as important as that of the motor segment—in other words, that sensation must be acute and perfect if the corresponding muscular movements are to retain their delicacy and precision.

Nervous System.—In a Lees and Raper Memorial lecture, at St. James's Hall, London, on the Effect of Alcohol on the Human Brain, Victor Horsley limited himself to the effects of small doses of the drug. He began by saying that all drugs had what is called a selective action, inasmuch as they act by virtue of a chemical affinity with the different parts of the structure, producing different effects in so far as these same parts differed. In regard to the effect of small quantities of alcohol on the central nervous system it was necessary to consider the results of the drug on the higher psychical functions of the brain—that is, on ideation or the intellectual thinking apparatus. The effect on the centers in the brain for voluntary action and the effect on the cerebellar membrane for

co-ordination and automatic equilibration had further to be dealt with. To find whether a brain worked as well after a small quantity of alcohol was taken as it did before, some means of exactly comparing the condition of the activity of the brain under these different circumstances was necessary. The easiest way to do this was to measure what was called the "reaction time," or the very small fraction of a second which was consumed by the nervous system while it received an impression and executed some movement in response to it. Kraepelin, who had made the most accurate investigations of this subject, had found that the simple reaction period was slightly quickened after the ingestion of a small amount of alcohol, but that very speedily a slowing began, and became more marked, and endured as long as the alcohol was in active operation in the body; so that the time spent by the complex reaction—or a reaction in which there was an association of ideas—was never quickened by the alcohol. On the whole a very distinct and depressing effect on the highest centers of the brain was produced. With reference to the effect of alcohol on voluntary movement it should be remembered that the energy producing a single contraction of a muscle was manifested in an intermittent manner; it was not one impulse, but a succession of impulses. Under the influence of alcohol the normal summation of these impulses was interfered with, and what was known as a tremor was produced. The results of Kraepelin's dynamometer measurements of the effect of small doses of alcohol on the voluntary centers showed, as in the former case, that an apparently additional amount of work was put out at first, but the acceleration or stimulation was quickly followed by the lowering or depressing effect. The effect of a dose of tea was spoken of as in marked contrast with this. No lowering effect is seen when tea is taken beyond the one due to normal fatigue common to all experiments. The apparent acceleration induced at first by alcohol has not been explained, but it may result from a loss of control. It "was not to be regarded as a real thing, but as an evidence of the paralyzing and deleterious effect of alcohol." The next subject for consideration was the influence of the drug on the cerebellum. A close association has been found to exist between the muscles of the lower limbs and this organ, and one of the further effects of alcohol in slightly larger doses than those which had been under consideration was to destroy the special function of the cerebellum and produce a sensation of tremor and weakness in the legs, causing the victim to stagger and find standing difficult. While it is extremely difficult to demonstrate scientifically the immediate chemical effect of alcohol on the nerve cells, it has been ascertained that under its prolonged use the granular masses in the Purkinje cells disappear, the protoplasm of the body of the corpuscle loses its distinctive structure, and the nucleus is very greatly altered and distorted in shape. Under the toxic influence of tonic alcoholism the dendrites of the pyramidal cells exhibit swellings and shrinkages. A remarkable constant feature of degeneration in the alcoholic person's brain is widespread pigmentation in the nerve cells—an exaggeration of a normal fact, accompanied by shrinkage of the protoplasm of the cell. The author gave as his conclusion that from a scientific point of view the contention so often put forward that small doses of alcohol, such as people take at meals, have practically no pernicious effect could not be maintained.

It is an established fact that the extinct mam-

malia of the middle and lower Tertiaries had, as compared with their nearest living congeners, an extremely small cerebrum. The same is the case in comparing anthropoid apes and man. The significance of the difference has been studied by Prof. E. Ray Lankester, who regards the fact as associated with the development of the faculty of educability. The earlier animals were possessed of the instincts and the faculties of performing certain acts appertaining to their species, but were incapable, or nearly so, of individual development. The growth of this faculty—which the author calls educability—is associated with increase in the size of the cerebrum. "A mere spoonful of cerebral tissue is sufficient to carry abundant and highly efficient *instinctive* mechanism from generation to generation, but for the more valuable capacity of elaborating *new* brain mechanism in the individual as the result of the individual's experience of surrounding conditions a very much larger volume of cerebral tissue is needed." Prof. Lankester applies this view to biological development and evolution, and to the question of the inheritance of acquired faculties.

In an evening lecture, delivered at the meeting of the British Association, Prof. F. Gotch said that animal electricity, if strictly interpreted, had a most extensive scope commensurate with all forms of animal life. This large scope gave the study of electro-physiology all its importance, an importance accentuated by the belief that electrical disturbance was the safest index as to the state of the living molecular poise, the poise which obscured, if it did not constitute, the mystery of life. The study had, however, a special significance in connection with one class of living structures, namely, those which constitute the nervous system. There was no doubt that organs of an essentially nervous type exist, the prime object of whose activity is the production of electrical disturbance. Of these the author considered especially the electric organs of certain fishes, concerning which he discussed four successive questions: First, what are the peculiar structural features which all electrical fish show, and how far these account for their extraordinary powers; second, what are the characters of the electrical shocks which these fish are able to give; third, what are the characters of the relatively insignificant electrical effects produced in a nerve when traversed by a nervous impulse; and, fourth, whether the two classes of electrical effects, those of the electrical fish and those of all nerves, could be regarded as fundamentally the same phenomena, in spite of their apparent dissimilarity. After describing the electric organs of fishes and their power, the speaker said that the nerve electrical effect was very similar to that present in each disk of the electrical organ. He then brought forward evidence to show that there must be an electrical disturbance in the nerve endings of an organ whenever a nervous impulse might be produced outside the nerves. The astounding effects produced by the electrical organs of fishes thus have their physiological counterparts in the nerves, and in this as in other departments of natural science Nature shows no gulf.

Studies of the centripetal and centrifugal medullated nerve fibers arising in the spinal ganglia of the mammal were made by H. H. Dale for the two purposes of determining the relative number of medullated fibers centrally and proximally of the spinal ganglion and of finding the relative number of the fibers of any given size in the same situations. An exact knowledge of these points would go far toward deciding whether any fibers end free in the spinal ganglion; whether either of the cell processes divides in the ganglion or soon

after its exit from the same; and whether the central and peripheral processes of any or all of the spinal ganglion cells are unequal in diameter. The author's conclusion is that in the cat there are constantly a few more medullated fibers in a nerve immediately distal to the spinal ganglion than in the nerve immediately proximal to the ganglion; that is, that there are a few more medullated fibers in the trunk than in the nerve roots. The excess is on an average about 0.5 per cent. of the total number of nerve fibers. The excess of nerve fibers in the trunk is apparently caused by fibers not more than $6\ \mu$ in diameter. These fibers are in all probability medullated fibers which pass to the trunk by way of the gray ramus communicans, and end in connection with the vessels or other tissue of the ganglion. Allowing for those fibers, the author finds that the number of fibers close up to the ganglion is the same as the number several millimetres from it both proximally and distally—that is, none of the medullated fibers given off by the ganglion cells end in the nerve or roots close to the ganglion. There are more fibers of $6\ \mu$ and upward in the anterior root close to the spinal cord than in the anterior root close to the ganglion—or, in other words, the fibers taper slightly. A similar difference appears between the size of the nerve fibers in the roots and that of those in the trunk. Probably, then, the posterior root fibers also taper slightly. The tapering of the motor fibers makes it impossible to draw conclusions as to the relative size of the central and peripheral processes of the spinal ganglion cells, but the evidence is against the view that the central processes are in general conspicuously smaller.

The objects of certain experiments described by J. N. Langley were to ascertain the extent of the pilomotor reflexes which are obtained on stimulating different portions of the sympathetic chain, to determine the mechanism by which the reflexes are produced, and to point out certain deductions which are to be drawn from the facts as to the arrangement of the preganglionic nerve fibers. It was shown that each efferent nerve fiber (preganglionic nerve fiber passing from the spinal cord to the sympathetic) divides into branches and supplies several, probably many, nerve cells. The nerve fibers which run to compound ganglia, as the superior cervical ganglion, the ganglion stellatum, and the coccygeal ganglion, may send all their branches to one ganglion. The fibers which run to single symmetrical ganglia send their branches to more than one ganglion. In the lower thoracic, the lumbar, and the sacral regions of the sympathetic in the cat the great majority of the fibers send branches to three ganglia; a few send branches to four. In the corresponding regions of the dog the single nerve fibers appear commonly to send to four ganglia, and probably to more. In the upper cervical region many of the preganglionic fibers run to five or six ganglia in addition to the compound ganglion of the stellatum. The ganglia to which a single nerve fiber gives branches are ordinarily consecutive. But if a ganglion contains no nerve cells of a given class, the fibers of this class will ordinarily pass over the ganglion without making connection with it, and send their branches to the next ganglion peripherally which does contain nerve cells of the given class. Stimulation of a preganglionic fiber at any part of its course sets up a nervous impulse which travels to all the branches of the fiber and stimulates the nerve cells with which the branches are connected. This stimulation peripherally of a fiber of one or more branches will excite nerve cells centrally in one or more ganglia of the point

stimulated, and will produce a preganglionic axon reflex. The author thinks that these results support the view he had previously put forward that no reflexes save axon reflexes occur from the ganglion of the sympathetic system.

In a study by the same author of the regeneration of the preganglionic fibers of the sympathetic system, the superior cervical ganglion in a cat was excised, leaving a gap in the nervous tissue of less than a centimetre. The cervical sympathetic nerve did not recover its function for a year and eleven months. The result was regarded as establishing a possibility that the preganglionic fibers are unable to form direct functional connections with the peripheral tissues. Direct stimulation of the sclerotic, on the side on which the ganglion had been excised, did not give local dilatation of the pupil. This had already been observed. The fact affords evidence that all the fibers for the radical contractile substance (dilator muscle) of the pupil pass through the superior cervical ganglion and have no nerve cells on their course beyond this ganglion. Although the cervical sympathetic did not recover its function, the nerve strands beyond the place of section contained numerous normal nerve fibers. After section of the lumbar sympathetic trunk, no return of function was found for thirty days, a very slight return was found in thirty-five days, and a considerable though not complete return in forty-eight days. Broadly speaking, the pilomotor fibers in regenerating establish functional connection, first with the nearest ganglion, then with the next, and so on downward. The new connections of the various classes of nerve fibers in the several spinal nerves are not made indiscriminately with the several ganglia and with the different classes of nerve cells in them. A marked tendency is observed for the normal complex relations to be re-established. But some abnormal connections are made. On the view that nerve fibers grow out from their nerve cells, it appears probable that one factor in bringing about a re-establishment of normal connection is a tendency of the several cut fibers to grow to a certain definite length—in other words, that the axon process of each nerve cell, whenever it is cut, will in favorable conditions grow to its original length, neither more nor less.

It was observed by Von Monakov that after hemisection of the spinal cord just below the pyramids, the nucleus of Deiters underwent complete atrophy on the same side as the lesion. This author concluded, from an experiment on a single animal, that the nucleus of Deiters has no special connection with the eighth nerve, but is situated on the path of the sensory or afferent fibers passing from the spinal cord to the brain. Ferrier and Turrer, in 1893, obtained in cases of cerebellar lesion complicated by a lesion of Deiters's nucleus, degeneration of some fibers in the antero-lateral region of the cord on the same side as the lesion, and concluded that the fibers in question were probably derived from the cells of Deiters's nucleus. In this view they were supported by the researches of Risieu Russell, while they were opposed by the conclusions of Marché and Thomas that removal of the cerebellar hemisphere alone without any injury of Deiters's nucleus was followed by descending degeneration of some of the fibers of the antero-lateral region of the cord. Such fibers had been recognized by Löwenthal as undergoing a degeneration below a hemisection of the upper part of the spinal cord. A further investigation of the subject has been made by R. E. Lloyd, the result of which goes to show that hemisection of the upper part of the cord is followed

by chromatolysis of the cells of Deiters's nucleus on the same side as the lesion, and to render it probable therefore that the fibers of the antero-lateral descending tract are derived from the cells of that nucleus, and not from the cerebellum.

Nicolas Alberto Barbieri has found that in cats, dogs, rabbits, and guinea pigs the unipolar or bipolar cells of the spinal ganglia do not form any connection with the nerve tubes of the posterior roots. These cells may be dissolved by chemical means without altering the form, contour, or even the continuity of the nerve fibers of the posterior roots. Each spinal ganglion contains from 200 to 500 cells, while the number of nerve fibers that traverse the same ganglion is from 1,000 to 3,000. This number is about double that of the nerve fibers found in the anterior roots, which varies from 500 to 1,500. All the nerves of spinal origin contain a far larger number of fibers derived from the posterior than from the anterior root. Besides the ordinary fibers of the posterior roots, others of smaller diameter may be found enveloped by a thinner sheet of connective tissue, with less granular, more transparent, and almost limpid contents. The medullary and encephalic origin of the sympathetic is established to the satisfaction of the author by examinations of the branching and relations of the small fibers which are described in the paper. The cells of the spinal ganglia are found to be cells of the sympathetic from which the rami communicantes proceed. The whole number of the nerve fibers of all the roots of the spinal nerves is in the rabbit about 70,000, a number too small for the supply of all the tissues of the animal, while it is too large to come into relation with the surface of section of the collet du bulbe. The posterior roots spring from the posterior collateral fissure by small fasciculi. Each fasciculus contains a certain number of nerve fibers, and several fasciculi form a root, and several roots form a radicular root. Two or three radicular nerves separated from one another by the spinal dura mater are found on the superior surface of each spinal ganglion. The posterior roots penetrate the ganglion largely provided with connective tissue, or in the condition of a nerve. The anterior roots which arise from the ventral collateral grooves have an analogous origin, and unite externally and below the ganglion with the posterior radicular nerves to form the mixed peripheral or proto nerve. The mixed peripheral nerve of each pair of spinal nerves, after having given origin to the small meningeal branch, divides into two branches, the one anterior and large, the other posterior and small.

It has been observed that after reunion of a divided nerve by means of suture function may return sooner or later, and that this restoration of function implies not only simple return of sensation and the capacity to make voluntary movements, but also the re-establishment of complete localization of sensation and of co-ordination of movements. Care is usually given in suturing divided nerves to bring the two segments into as close an approximation as possible to their old relationship. Thus the perfect recovery of localized and co-ordinated functions might perhaps be due to a majority of the fibers being so placed in a position for a union of corresponding ends to be effected. This subject has been recently investigated by Dr. Robert Kennedy, of Edinburgh, in three experiments on dogs, in which the sciatic nerve was divided at the level of the trochanter, and in two of them rotated before suture to the extent of a semicircle, while in the third experiment accurate coaptation by suture in normal position was effected. In the matter of recovery

of function, the three experiments followed a practically identical course. Under microscopical examination the central segments showed the characters of the normal sciatic nerve with the exception that the lymphatic spaces were somewhat distended. The peripheral segments agreed in showing no old nerve fibers in any part examined either close to the seat of reunion or in the terminal divisions of the nerve. In their place were abundant young nerve fibers with well-defined characters. Lying between the young nerve fibers were degenerated remains of the old fibers, showing that Wallerian degeneration had taken place. The cicatricial segments were also all three practically identical in structure. In no case could continuity of nerve fibers from the central to the peripheral segment be traced. The author's conclusions were (1) that after section and immediate coaptation of a nerve restoration of conductivity and of voluntary function may be effected in a few days; (2) that this early restoration of conductivity need not be the result of the reunion of the old nerve fibers—that is, reunion by so-called first intention, or without Wallerian degeneration, but may be the result of regeneration of young nerve fibers in the peripheral segment; (3) that voluntary co-ordinated movements are regained equally soon, whether the two ends of the divided nerve are united as accurately as possible, so as to bring the corresponding ends of the nerve fibers into as near contact as can be attained, or whether, previously to reunion, the peripheral segment is twisted so that when united to the central segment noncorresponding ends of the nerve fibers are brought into contact; (4) that in the latter case it is left doubtful whether the restoration of function is due to the re-establishment of the old paths by decussation in the nerve cicatrix or to the reunion of ends of nerve fibers which do not correspond but which happen to be brought into apposition; (5) that in suturing a divided nerve no trouble need be taken to secure the coaptation of the two segments in the old relationship, for the simple approximation of the two ends, no matter in what relationship, seems to be all that is required.

In experiments on the work of the spinal nervous centers Mlle. J. Ioteyko has found that the marrow has double the power of resistance to fatigue possessed by the terminal organs—giving twice the work in response to the same excitation; and, second, that it is capable of remaining excited four times as long as the muscle without betraying any sign of fatigue. In short, the results obtained by the author indicate a great power of resistance in the special nervous centers, and go to show that they are able to furnish, without fatigue, an amount of work at least four times more considerable than the terminal apparatus.

From studies made upon rabbits, it is concluded by Ivor L. Tuckett that after section of the vagus nerve all the fibers will in time recover their function; that the recovery is more rapid and probably more complete in the case of fibers supplying striated muscle than of those supplying cardiac or unstriated muscle; that the inhibitory fibers recover function at least as rapidly as the motor fibers; that the recovered function of the "autonomic" fiber is even at the end of three years less than normal.

Prof. Hitzig, of Halle, discussing in a Hughlings Jackson lecture before the Neurological Society, the localization of functions in definite areas of the cortex of the brain, advocated the view that such centers exist, and further contended that two sets of motor centers might be

distinguished—viz., a lower, subcortical, or reflex set called into play by impressions of hearing, vision, or other special senses; and a higher, cortical set, concerned with conscious, arbitrary motion.

The sheath of Schwann of medullated nerves has been shown by Dr. A. Gurtsch to be genetically an exogenous and quite foreign mesodermal formation. The observation was made that it did not in the first instance closely embrace the medullary sheath, but that the space between the two was gradually filled up by the growth in girth of the axis cylinder and of the medullary sheath.

Special Senses.—A case of the cerebral lesions observed in an instance of complete acquired color blindness while achromatic vision was retained is described by Dr. George Mackay and Dr. J. C. Dunlop, of Edinburgh. The patient, a man of great mental capacity, sixty-two years of age, whose color sense had always been good, and who especially appreciated the bright colors of flowers, having become anæmic, all at once experienced serious defects in his eyesight, finding himself unable to read his letters or to recognize vivid colors in some children's dresses. On examination, Dr. Dunlop found him completely color blind, while his distant form sense was good. The external aspect of his eyes was natural, but every color appeared gray to him. The diagnosis was double homonymous hemianopsia, complete for color sense, incomplete for form sense about the point of fixation. During the two months following the examination the patient acquired greater facility in reading, but had no restoration of his color sense. In a little less than four months from his attack he suddenly developed a right-sided hemiplegia, and in five days afterward died. The post-mortem examination disclosed an atrophy of the temporal occipital convolution on both sides, affecting the lower edge of the occipital radiation. This atrophy was found to be due to a hyaline degeneration of the adventitia of the vessels, which had to a great extent cut off the blood supply, and had led to complete destruction of the proper elements, both fibers and cells, of the affected portions of the brain. The authors remark that in this case the total loss of color sense was associated with a bilateral lesion of the fusiform convolution so well defined and symmetrical that it is difficult to avoid the conclusion that the gray matter of that convolution is probably concerned in the perception of colors.

While until recently the smallest lateral difference of place that is just perceptible by vision has been given as from about 50" to 1' angular measure, Prof. George M. Stratton, using a modified method, has found that lateral difference of place of about 7" can be directly perceived. In the old method of determination, employed by Helmholtz and others, two parallel lines were brought together until they were just finally distinguished as two. In the experiments of Prof. Stratton, instead of using lines or points side by side, lines were so arranged end to end that the upper of two perpendiculars could be moved at will to the right or left, while still remaining exactly parallel to the lower line. The observer had simply to judge whether the upper line was continuous with the lower line, or to which side it was displaced. The result, which gives 7" as the limit of space distinction under these conditions, is interesting as explaining the experiments of Bourdon, according to which a difference of position amounting to only 5" gives a perceptible stereoptic effect.

In a study of the effects of repeated detonations on the ear, made during the firing at a camp in Natal, the German Dr. Müller examined 96 tympanums before and after the exercise. He observed notable alterations in 44 cases. Seven times multiple hemorrhages were remarked, manifesting themselves as minute droplets of blood, the flow in one case being as large as a lentil. In 37 other cases there was merely a diffused, more marked redness on the margin of the tympanum. As a rule, the ears on which alterations were remarked had been previously not quite normal. With 40 subjects the distance at which the tuning fork was heard was diminished. Rinné's test always gave positive results. In 28 cases words spoken in a low tone were not heard at 8.6 metres, the normal mean. Only four subjects complained of hummings and tinklings. The author believes that serious lesions are extremely rare with men who perform their two years of service. On the other hand, officers and underofficers whose duty it is to give instruction in firing during long periods often become partially deaf, and are afflicted with hummings. Retraction and bluntness of the tympanum are detected in such cases. Dr. Müller draws the conclusion from his experiments, that only men with perfectly sound ears should be received in the artillery.

The experiments of Weber on the least observable differences in the action of weight as interpreted by sensation led to the conclusion that to obtain an observable difference in sensation we must always add one third. Fechner, assuming that the increase is always the same proportionately, deduced the Weber-Fechner formula for stating the relation of stimulus to sensation in quantitative terms, which may be thus expressed. To obtain an arithmetical series of sensations a geometrical series of stimuli is required. To give the former, equal increments of sensation are added; to obtain the latter, we must multiply the successive stimuli by the common factor. C. Lloyd Morgan, finding that the results of a large number of carefully conducted observations were not in accordance with this formula, has made continued studies of the subject, which are described in the *Psychological Review* and in *Nature*. From them he deduces a modification of the Weber-Fechner formula as follows: For constant increments of sensation the concomitant increases of stimulation are in geometrical progression. This differs from the Weber-Fechner formula in that it assigns the geometrical progression to the successive increments of stimulus.

Miscellaneous.—Researches by Prof. F. T. Paul on the development of dentine confirm the view that the process is practically similar to the formation of bone in membranes. Among the points brought to light is the fact that the young pulp contains a complete fibrous basis composed of delicate wavy fibers interlacing in every direction. These fibers are found to be directly derived from the cells, and are of a gelatin-yielding character. It is also shown that the first layer of cells found on the surface of the pulp beneath the ameloblasts are not odontoblasts, but develop into fibers, and on the actual surface these fibers blend together and form a membrane which lies just beneath the ameloblasts. The odontoblasts make their appearance subsequently, and insert themselves, as it were, between these fibrous surface cells, the nuclei of the latter undergoing atrophy. The odontoblasts are represented as being invested with a complete network of fibers derived from the connective tissue

of the pulp, these fibers meeting over the dentinal end of the odontoblasts so as to form a thin fibrous layer between these cells and the dentine matrix. The matrix is supposed by the author to be secreted by the odontoblasts into this layer of tissue.

As results of his studies of the development of the primordial cranium, Dr. Giuseppe Levi, of Florence, concludes that the first rudiments of the primordial cartilaginous cranium in man occur in the form of isolated groups of closely compressed connective-tissue cells in looser tissues than that which forms the membranous primordial cranium. A certain homology appears between these aggregations of cell groups and those of the future bone; but there is no homology between these rudiments of the skull of man and those described in mammals as parachordals and trabeculæ. The rudiments preserve their identity for some time, even after their conversion into cartilage, by the possession of a perichondrial layer. They do not all coalesce till just before the chondrocranium has attained its highest development, when the chondrocranium for the first time forms one continuous whole. In the order of formation of the rudiments formed by connective tissue, that of the occipital bone is the earliest; after it follow those of the sphenoid and of the auditory capsules; and lastly that of the ethmoid. The differentiation of the several rudiments, progressing with unequal rapidity, is, as a rule, most rapid in the latest formed parts, and it presents characteristic features in each case, advancing quickly in the occipital region and almost contemporaneously throughout its whole extent, while in other instances it begins at a definite spot in a kind of cartilaginous nucleus and spreads uniformly outward. The enlargement of the rudiments is at first rapid, but afterward extremely slow. The development of the occipital region is similar to that of the vertebral column. The histological features of the formation of cartilage are particularly identical with those of this column, while they are different from those of all other segments of the skull. Moreover, there is one distinct rudiment of a vertebra—the occipital—which has a symmetrical origin, and farther forward are parts of an indeterminate number of vertebræ. The occipital region, like the vertebral column in the first stages of its development, is in connection with the chorda, but becomes distinct from it as the cartilage develops. These facts support Frierip's view that the occipital region represents the true spinal segment of the skull in man. "The symmetrical rudiments of the body of the occipital vertebra become the condyles of the occipital, the unsegmented portion represents the portio basilaris, and the lateral portion of the arch of the occipital vertebra the processus jugularis." Some changes of form take place in the development of cartilage through the absorption of parts of the rudiments and through alteration of the position of the occipital and sphenoid rudiments; and the floor of the sella turcica is the only segment of the skull which preserves its original position throughout the process of development.

In the preliminary experiments made by W. S. Halliburton for the purpose of testing the conflicting results reached by other investigators of the effects of injections of extracts of nervous tissues, all the extracts used produced a fall of blood pressure, partly by their effect on the heart, and partly by dilatation of vessels in the splanchnic area. The effect was more marked the greater the proportion of gray matter in the tissue used. It was not abolished by the section

of both vagi, but was abolished, as a rule, after atropine. The substance that produced the fall was not proteid, but was soluble in alcohol. From the alcoholic solution the author always obtained typical crystals of the platinum double salt of choline. Though the choline thus proved to be present was undoubtedly one cause of the fall in blood pressure, there were probably other substances that might be present as well, but they had not yet been fully identified; lactic acid was probably one. The depressor effect of lactic acid was not abolished by atropine; and this fact, it is suggested, may account for those cases in which the fall was not completely abolished by that substance. Glycerin itself (1 in 20 of saline solution) generally produces a fall of blood pressure, which is not abolished by atropine.

The name spermine is given to certain needle-shaped crystals which Charcot observed for the first time in the blood of leuko-erythemics, which Leyden had discovered in the expectoration of asthmatics, and which Schreiner found in sperm, and which were analyzed, identified, and characterized by Poehl. The object of a research by Walter E. Dixon was to ascertain the effect of injections of spermine in order to determine how far the substance is responsible for the effects produced by injections of Brown-Séquard's fluid. It was shown by experiments made on cats that spermine produces a fall of blood pressure from which recovery is rapid and the normal level is soon reached. The effect is largely cardiac, but is also partly due to dilatation of vessels in the splanchnic area. The effect of the use of atropine is to cut out completely the fall of pressure, without, however, influencing the splanchnic dilatation. The vessels of the kidneys seem quite passive to the change of blood pressure. The effect on the splenic vessels is marked by the constriction of the splenic muscle. A stimulant effect on the involuntary muscles of mammalian intestine as well as on the isolated strip of frog's stomach is also noticeable. Spermine produces a gradual rise in the body temperature. A close resemblance exists in the effects upon the heart and circulatory system of the action of choline and of spermine, and the two substances are about equally toxic. The chief interest of spermine depends on the fact that it is constantly present in all tissues of the body, and in certain pathological conditions (leuko-erythemia and some nervous diseases) is increased. It is said to be present in the normal animal in greatest quantity in the testis and nervous tissue.

The presence of arsenic in the body has been studied by M. Armand Gautier, who communicated a paper on the subject to the French Academy of Sciences, Dec. 4. The author found this substance normally present in the thyroid gland in the proportion of 0.075 milligramme to 100 grammes of the dried gland. It is found also in the skin, hair, and nails, and in ox horns; in the mammary gland, and consequently in the milk which it elaborates. The brain of the fœtus contains arsenic, as also does the brain of the newly born infant, but no trace of it was found in the adult brain of hospital patients. It also occurs in the bones, but was not found in the liver, pancreas, kidney, spleen, pituitary gland, stomach, and intestines. The last fact is of considerable importance, as it bears upon toxicological researches, for there results from it as an immediate consequence that if arsenic is found at any time in the stomach or an intestine it is not normal.

The remarkable changes made in recent years in the diameter and velocity of rifle bullets have

been followed by as remarkable changes in the character of the wounds produced by them. The subject has been experimentally investigated in the case of wounds inflicted in the South African War by Sir William MacCormac, who has been aided in his study by the light of observations which he made during the Franco-Prussian War. According to a summary of the author's observations given in the *Lancet*, the damage caused by the modern bullet, especially by the Mauser bullet, can not be compared in severity with that inflicted by the needle gun or the chassépot. The projectile bores a small clean hole right through the part, and the exit opening can hardly, if at all, be distinguished from that of entrance. The wounds are on the whole aseptic, and heal readily under a simple antiseptic dressing. When only the soft parts of a limb are perforated and no important vessels have been torn, the shock at the time of infliction of the injury is slight, and recovery is rapid and complete. Even when a bone has been hit the bullet may make a clean hole through it without any, or with only a very little, splintering. This is naturally more common in the case of flat bones, such as the scapula, than in the long bones; but it has also occurred in the case of the bones of the limbs. In many instances, even when important structures have been in the line of the bullet, no harm seems to have resulted. In one case where the direction of the wound indicated that the bullet must have pierced the stomach, no symptoms of any such injury appeared. In another case, where it seemed almost certain that the colon was perforated, while obstinate constipation followed the injury, no peritonitis arose. Not the least remarkable of the effects of the Mauser bullet is the very slight hæmorrhage resulting from the perforation of the lung. A little more hæmoptysis may result, but it soon ceases and convalescence ensues. Even when a comminuted fracture of a bone has been produced, complete consolidation of the broken bone may result. A slight case of perforation of a joint shows that only a slight synovitis may follow. These effects are very different from the havoc produced by a large-bore bullet.

"Plastic activity" is the term used by M. L. Ranvier to denote a phenomenon of change of form exhibited by cells in contact with an air bubble. Having gradually heated to 36° C. the peritoneal serum of a rat which contained some air bubbles, the author noticed that the lymphocytes of the fluid moved toward the bullæ, and on arriving at their surface became flattened, just as the cells would have done if they had impinged against a solid substance. When the temperature was allowed to fall to 21° C., the cells resumed their spheroidal shape; but on increasing the temperature they again became flattened. He regards the change of form as a consequence of the activity of the cell—that is, as a vital phenomenon, and looks upon it as showing that cells are highly sensitive and possess extremely delicate motor reactions.

By means of a process described by F. G. Hopkins a crystalline albumin may be separated from egg white which upon repeated fractional crystallization shows absolute constancy of rotatory power (30.7°) and a constant proportion of sulphur. The product is obtained with great ease and rapidity, and the yield is 50 grammes and upward per litre of egg white. The albumin has the percentage composition: Carbon, 52.75; hydrogen, 7.12; nitrogen, 15.43; sulphur, 1.57; oxygen, 23.13. It is obtained practically ash free. Albumin crystals obtained by the use of

ammonium sulphate may, as was shown in the investigation, be washed free from sulphate by means of a saturated sodium chloride solution containing 1 per cent. acetic acid, the crystals meanwhile retaining their form and their solubility in water. The crystals, being thus freed from adherent sulphate and dissolved in water, coagulation of the dissolved proteid liberates no further trace of sulphur. It is therefore unlikely that ammonium sulphate enters into the formation of the original crystal.

The results of two experiments made by John Haldane to test the supposition of Helmholtz that carbonic oxide is oxidized or otherwise destroyed in the living body were entirely negative, and the author was convinced by them that no destruction of the kind takes place to any appreciable extent.

Among the more notable books of the year on physiology are the two important cyclopædias of Prof. Schäfer, on the lines of the *Handbook* of Prof. Herrmann, the subjects being committed to the hands of experts, of Prof. W. H. Howell, of Johns Hopkins University, who has been assisted in the preparation of the work by several American physiologists of repute; one edited by Prof. Richet, of Paris, to extend to nine volumes, of which four are completed; the second volume of the *Traité de Physiologie* of Prof. Moyal and Prof. Doyon; a text-book by Dr. Winfield Hall, of the University of Chicago; new editions of the *Manuals* of Waller, Stewart, and Starling; and a translation by Miss Emma Bilstein of the well-known text-book of Storr.

PORTO RICO, an island of the West Indies, formerly a colony of Spain, ceded to the United States by the treaty signed at Paris on Dec. 10, 1898. In the beginning of 1900 it was under military rule until Congress should provide for the establishment of representative civil government. Gen. George W. Davis was the military governor.

Area and Population.—The area of the island is 3,688 square miles. The population in 1887 numbered 399,022 males and 399,554 females. In 1899 the total population was estimated at 957,000.

Commerce.—Since the tariff relations with the United States were settled commerce has increased rapidly, although the results of war and the hurricane of 1899 have lessened for the present the producing capacity of the island. In 1899 the imports from Porto Rico into the United States were \$3,179,827, already double as much as in 1895, and the exports from the United States to Porto Rico were \$2,685,848, nearly 50 per cent. greater.

Political and Economical Reconstruction.—The general condition of Porto Rico in the first period of American rule was unfortunate. The war had paralyzed the trade of the island, and when Spain surrendered the sovereignty she closed her ports to Porto Rican products, while the occupation of Cuba destroyed the only other important market. The trade in coffee and tobacco was ruined, and nothing was provided to take their place. In most cases money could not be procured by the planters to pay the interest on mortgages. Then in August, 1899, a terrible hurricane wrecked the plantations, destroying the food supplies and resources of the lower classes, killing over 2,000 and injuring over 3,000 persons, and sweeping away \$22,000,000 worth of property, including nine tenths of the coffee crop. The principal work of the army was to distribute 30,000,000 rations of one pound each to the famishing natives during the greater part of a year, and organize relief work on the roads, by which

wages could be earned by the idle men in improving the roads of the island, to which nearly \$1,000,000 were allotted by the Secretary of War. For the seacoast defense of the island the military authorities made provision for emplacing 309 heavy guns, 368 rapid-fire guns, and 372 mortars. Local officials were properly elected in September, 1899, and before the middle of February, 1900, mayors, town councils, municipal judges, and boards of education had been chosen and installed in all the towns. The military commander determined the qualifications of voters, which were the ability to read and write Spanish, English, or any other language, or the payment of \$1 in taxes during eighteen months preceding the elections. Under these conditions the number of votes polled reached 51,179, equal to 5.375 per cent. of the population. Although no armed soldiers approached the voting places, the elections were held under strict army supervision, and the returns were unquestionably honest. A tariff law was passed for Porto Rico by Congress, applying the rates of the Dingley tariff on imports from the United States and on Porto Rican produce into the United States 15 per cent. of those rates. Another bill, signed on March 25, devotes to the aid and relief of Porto Rico all the revenues collected from imports from the island into the United States under the Dingley tariff since the Spanish evacuation until otherwise provided. An act of Congress approved by the President on April 12, 1900, provided for the civil government of Porto Rico. On May 1 the military governor turned over to Gov. Allen the direction of civil affairs. The machinery of civil government was already in charge of experienced public officers, and in every municipality were officers chosen by the electors and exercising practically autonomous government. The insular treasury contained a balance of \$300,000. Much had been done to improve the sanitary conditions of the island. Compulsory vaccination saved the people from an epidemic of smallpox, and sanitary boards with large powers were established everywhere. Gov. Allen appointed a Cabinet. An Executive Council consisting of 6 Americans and 5 Porto Ricans is the upper house of the Legislature. Courts were established and worked satisfactorily excepting in regard to acts of violence growing out of political passions, in which cases the party allegiance of the judge often influenced his decision. The municipal police was likewise influenced by politics in dealing with offenders, and the insular police of the country districts, which was under the direct control of the central authorities, was much more efficient in preserving order. A general election was held on Nov. 6 for members of the Legislature, which was convened for the first Monday in December. There were two parties—the Republicans, led by Dr. José Barvosa, who supported the American administration upon the tariff and other measures, and the Federals, led by Muñoz Rivera, who demanded more autonomy. The island was districted by the Executive Council. Each district elected 5 of the 35 members of the House of Deputies. The same qualifications were provided as in the municipal elections, in which the Federals had a popular majority of 6,111.

The building of roads to bring the products of the interior to market was the most necessary improvement, undertaken by the Americans in connection with famine relief, and carried on until all the important towns have communication with the seaports. Except the military road from San Juan to Ponce and the three railroads running along the coast, the only means of transport,

even from the important coffee districts around Utuado and Adjuntas, was by pack mules over bridle paths. The longest of the new roads runs across the island through those towns from Arecibo to Ponce, 52 miles, with branches from Arecibo and Utuado to Lares, and roads from Lares to Aguadilla through San Sebastian and Moca and to Mayaguez through Las Marias. From Ponce a road passes through Guayanilla, Yauco, Sabana Grande, and San German to Mayaguez. Another road runs from the port of Humaco to Caguas on the military road and on to Comerio, to be followed by one running north from Comerio to Bayamon. Another goes from Morobis through Ciales to the railroad at Manati. Others connect Corozal with Bayamon and Toa Baja and Guayama with Arroya. A road from Comerio to Barranguitas and Barros and connecting with the road from Utuado to Jayuya will complete the chain of new roads traversing the island from end to end, and crossing at right angles the old military road and the new road from Arecibo to Ponce. The new roads have a maximum grade of 7 per cent., and in the mountainous parts they cost \$25,000 a mile, 10 per cent. more than the Spanish military road, though most of them are built for \$10,000 a mile. Many schoolhouses have been built by the Government, which intends to have a school in every barrios. A normal school at Fajardo has been completed. Criminal bands that once infested the mountain districts have been driven out entirely by the insular police, and many of the leaders brought to justice. The administration of justice has in general been freed from political influence. The insular police, which has freed the land from bandits and maintains perfect order throughout the island, which the Spanish civil guards never did, because they were under political influence, was organized by a German-American soldier, Lieut. Frank Techter, except whom all the 19 officers and 440 men are Porto Ricans, and many of them belong to the most intelligent and cultivated classes; for without a strict examination no one is admitted, and only young men of courage seek the service. Porto Rico has been made a judicial district of the United States, and the organization of the judiciary is the same as in the United States. The sanitary condition of the island was formerly horrible, the people ignorant and careless of cleanliness and the rules of health. Filth, diseases, and epidemics were common. The military authorities, when they took hold, set the convicts in the jails to cleaning the streets of Ponce and San Juan, and native health officers induced the people to cleanse their premises and keep them clean. The general vaccination of the people was enforced by the insular police, with the result that not a single death from smallpox has since occurred, although there were 242 in the preceding six months. Markets, bakeries, and milk depots must now be kept clean, and a system of food inspection has been introduced. Schools, jails, and hospitals are for the first time kept in a sanitary condition. Anæmia, the most debilitating and fatal disease in Porto Rico, has been found to be due to a parasite, the ravages of which have already been lessened and will cease when filth is abolished. Under Spanish rule not 15 per cent. of the children went to school at all, and only 10 per cent. learned to read and write. A graded system of public schools has been introduced by the present Government, which has taken hold of the whole system of public education, and devotes to it 12 per cent. of the public revenue, twice the proportion assigned by the Spanish Government, and diverted in part to other purposes. In

each district an American supervisor was appointed. The insular Board of Education consisted of 2 Americans and 3 Porto Ricans. Instead of relying partly on fees for the support of the schools, the Government has made education perfectly free, but not compulsory, because there are not yet schoolhouses and teachers enough. Children are taught the English language and American history.

PORTUGAL, a kingdom in southwestern Europe. The throne is hereditary in the family of Saxe-Coburg-Braganza. The legislative power is vested in the Cortes, consisting of a Chamber of Peers, containing 52 hereditary, 13 spiritual, and 90 life peers, and a Chamber of Deputies, containing 120 members elected directly by all citizens possessing an elementary education or an income of 500 milreis. The reigning King is Carlos I, born Sept. 28, 1833. The Cabinet of Ministers, constituted on Aug. 18, 1898, consisted in the beginning of 1900 of the following members: Premier and Minister of the Interior, José Luciano de Castro; Minister of Foreign Affairs, F. A. de Veiga Beirão; Minister of Finance, M. A. de Espregueira; Minister of Justice and Worship, J. M. d'Alpoim; Minister of War, Gen. Sebastião Custodio de Sousa e Telles; Minister of Marine and Colonies, A. E. Villaça; Minister of Public Works, Industry, and Commerce, E. J. Sousa e Brito.

Area and Population.—The area of Continental Portugal is 34,528 square miles, with 4,660,095 inhabitants in 1890; area of the Azores and Madeira, 1,510 square miles, with 389,634 inhabitants; total area of the kingdom, 36,038 square miles, with a total population of 5,049,729. The population included 27,000 Spaniards, 5,000 Brazilians, 2,500 French, 1,786 English, 800 Germans, and 800 Italians. The emigration in 1898 was 230 to Europe, 4 to Asia, 21,422 to America, and 1,854 to Africa; total, 23,510. The birth rate in 1896 was 31.24 and the death rate 23.71 per thousand.

Finances.—The revenue for 1899 was 52,288,835 milreis, and expenditure 56,307,080 milreis; the estimated revenue for 1900 was 52,373,581 milreis, and expenditure 53,919,296 milreis. The estimates for 1901 make the revenue from direct taxes 12,249,370 milreis, from stamps and registration 5,506,000 milreis, from indirect taxes 24,294,050 milreis, from additional taxes 1,098,700 milreis, from national property and miscellaneous sources 3,506,935 milreis, *recettes d'ordre* 4,383,070 milreis; total ordinary revenue, 51,038,125 milreis; extraordinary revenue, 1,150,000 milreis; total revenue, 52,188,125 milreis. The estimated expenditures for 1901 are 9,774,954 milreis for the civil list, the Cortes, and various purposes, 19,954,094 milreis for the consolidated debt, 500,000 milreis for losses by exchange, 3,690,852 milreis for the Ministry of Finance, 2,411,051 milreis for the Ministry of the Interior, 1,057,389 milreis for the Ministry of Justice, 5,950,754 milreis for the Ministry of War, 4,377,128 milreis for the Ministry of Marine and the Colonies, 353,596 milreis for the Ministry of Foreign Affairs, 4,597,562 milreis for the Ministry of Public Works, and 69,338 milreis for the deposit and consignment office; total ordinary expenditure, 52,736,728 milreis, extraordinary expenditure, 2,112,229 milreis; total expenditure, 54,848,957; deficit, 2,660,832 milreis.

The public debt of Portugal, which was less than 9,500,000 milreis in 1853, had grown in 1890 to over 428,000,000 milreis. In 1892 the interest on the internal currency debt was reduced 30 per cent., and that on the external gold debt was reduced 60½ per cent. in 1893. In 1899 the ex-

ternal debt outstanding amounted to £62,901,275, consisting of £39,472,091 of consolidated 3-per cent. debt, £1,811,497 redeemable and paying 4 per cent., £12,758,887 paying 4½ per cent., and the tobacco loan of £8,858,800, also paying 4½ per cent. The consolidated internal loan of £58,951,812, paying 3 per cent., was largely held abroad likewise, and there were £6,143,426 of other internal debts besides £27,579,446 of internal and £2,318,819 of external debt partly in the hands of the Government. The floating debt amounted to 43,822,549 milreis.

The gold standard was adopted by Portugal in 1854, and 7,950,002 milreis of gold coins were struck, but none since 1891. The silver coinage amounts to 30,232,436 milreis; the circulation of Bank of Portugal notes, 68,175,157 milreis.

The Army and Navy.—The peace effective of the Portuguese army is 48 officers and 795 men in the engineers, 298 officers and 4,419 men in the artillery, 276 officers and 4,020 men in the cavalry, 1,001 officers and 19,912 men in the infantry and chasseurs, and 10 officers and 557 men in the train and subsistence and health departments, with 81 officers and 297 men attached to reserve depots, making the total 1,804 officers and 30,000 men, with 5,404 horses and mules and 144 guns. This does not include 80 officers and 2,176 men in the municipal guards, nor 136 officers and 5,619 men of the fiscal guard. The war strength is stated to be 3,476 officers and 145,639 men, with 15,849 horses and mules and 312 guns, formed by raising the strength of the active army to 2,029 officers and 82,843 men, with 10,736 horses and mules and 216 guns, and calling out the reserve troops, numbering 1,447 officers and 62,796 men, with 5,113 horses and mules and 46 guns. The troops maintained in the colonies, the majority of them natives, number 9,478 of all ranks.

The Portuguese navy has 1 old ironclad, 5 protected cruisers, not all of them completed, 2 new and 4 old third-class cruisers, 10 river and 16 seagoing gunboats, and 15 first-class and 30 small torpedo boats. A national defense committee has raised funds by private contribution to help the Government strengthen the fleet.

Commerce and Production.—In the south of Portugal land is held in large estates and tenant farming prevails. In the north the holdings are small and are more highly cultivated because the peasants either own their land outright or hold it by the ancient custom of *aforamento*, subject only to a quitrent, for which the owner may distraint if not paid at the term, though he can not evict unless it remains unpaid for five years. The holder can do what he pleases on the land, and he may sell his tenant right and improvements, as the owner may his right to the quitrent, but in either case the other has the option of purchasing in preference to a third party. Corn and cattle are raised in northern Portugal, in the mountainous parts rye, sheep, and goats, wheat and corn in the center, wheat and hogs in the south, where the cork bark is cut, grapes everywhere, olives, figs, and oranges in many places, tomatoes extensively, and a great many potatoes and onions. The fishermen of Portugal have 4,000 boats, and the sardines and tunny that they catch are exported, the value of fish exports in 1898 having been 3,717,006 milreis. The minerals raised in 1898 were valued at 1,717,828 milreis, consisting of copper precipitate and ore, sulphur ore, lead, arsenic, tin, manganese, antimony, and iron ores, wolfram, and a little gold and silver. Salt, gypsum, lime, and marble are exported. The total value of special imports in 1898 was 50,822,766 milreis, and of exports 33,207,165 milreis. The

imports of live animals were 3,141,986 milreis in value, and exports 3,350,568 milreis; imports of raw materials 20,155,307 milreis, and exports 5,109,854 milreis; imports of textiles 5,663,041 milreis and exports 2,725,866 milreis; imports of food and drink 13,338,886 milreis, and exports 18,015,928 milreis; imports of machinery and implements 2,913,336 milreis, and exports 105,111 milreis; imports of various manufactures 3,341,521 milreis, and exports, 1,820,663; tax on imports, 72,861 milreis; total imports of merchandise, 48,626,938 milreis; total exports of merchandise, 31,127,990 milreis; imports of coin and bullion 2,195,828 milreis, and exports 2,079,175 milreis. Of the particular imports the value of wheat was 3,658,152 milreis; raw cotton, 3,532,067 milreis; cotton goods and yarn, 2,866,055 milreis; sugar, 2,042,165 milreis; codfish, 1,193,818 milreis; coal, 1,873,192 milreis; iron, 1,335,508 milreis; cattle, 1,219,317 milreis; leather and hides, 1,193,818 milreis; wool, 1,149,837 milreis; woollen goods and yarn, 1,025,665 milreis; coffee, 670,589 milreis; leaf tobacco, 467,813 milreis. The wine exported in 1898 was valued at 11,480,972 milreis, consisting of 52,402,030 litres of common wine and 34,006,900 litres of liqueur wine, of which 2,430,150 litres were Madeira and 31,328,410 port. The common wine is shipped mainly to Brazil and Portuguese colonies, the port and Madeira to England. The principal other exports were cork of the value of 3,303,273 milreis; cotton goods, shipped to Portuguese colonies, 2,347,963 milreis; sardines, 1,523,706 milreis; copper ore, 766,096 milreis; cattle, 656,142 milreis; olive oil, 511,487 milreis; almonds, 482,076 milreis; figs, 390,087 milreis; horses, 368,493 milreis; eggs, 342,900 milreis; tunny fish, 291,698 milreis; onions, 263,829 milreis; pineapples, 241,413 milreis. Of the total value of imports 32 per cent. came from Great Britain, 14 per cent. from the United States, 14 per cent. from Germany, 10 per cent. from France, 9 per cent. from Spain, and 21 per cent. from other countries; of the total exports 28 per cent. went to Great Britain, 20 per cent. to Brazil, 16 per cent. to Portuguese colonies, 13 per cent. to Spain, and 23 per cent. to other countries. Of all the wines imported by Great Britain in 1898, the wines of Portugal formed 24.6 per cent. of the quantity and 21.6 per cent. of the total value.

Navigation.—The number of vessels in the foreign trade entered at Portuguese ports during 1898 was 6,525, of 8,923,129 tons; cleared, 6,502, of 8,981,434 tons. Of the number entered, 4,182, of 6,113,127 tons, had cargoes; of those cleared, 5,160, of 7,187,090 tons, had cargoes. In the coasting trade, 4,309 vessels, of 1,363,197 tons, were entered and 4,217, of 1,298,055 tons, cleared.

The commercial marine on Jan. 1, 1899, comprised 63 steamers, of 60,000 tons, and 573 sailing vessels, of 69,522 tons, inclusive of vessels in the colonies.

Railroads, Posts, and Telegraphs.—There were 1,464 miles of railroad in operation in 1898, of which the Government owned 507 miles. The number of passengers carried in that year was 11,384,737; tons of freight, 2,034,603; net receipts, 3,377,835 milreis. The length of telegraph lines was 4,584 miles, with 9,475 miles of wire. The number of telegrams sent in 1898 was 1,272,042 in the internal and 1,065,309 in the international service.

The number of letters, newspapers, etc., forwarded through the post office during 1898 was 55,201,810 internal and 10,202,493 foreign and colonial.

Politics.—The derangement of the Portuguese finances and the measures adopted to meet the

obligations of the Government have caused widespread discontent without loosening the control of the Government over the electorate, which returned the usual loyal majority in the elections of November, 1899, although the Opposition was less submissive in character and included three Republicans from Oporto. Republicanism has gained many adherents, especially among the working classes. When the Cortes met on Jan. 2, 1900, the Government could boast of the success of a military expedition over the tribes in northern Mozambique that make Portuguese territory a base for raids upon the British semicivilized natives of Nyasaland. The financial proposals of the Government involved an increase in taxation. A proposal of Ferreira Almeida to sell certain colonies in order to relieve the financial embarrassment was rejected by a majority of 64 votes after a statement of the Ministry of Marine that the Government would maintain the integrity of the colonial territory. A meeting of Republicans in Oporto to protest against this and against the passage of British troops through Portuguese territory in South Africa to operate against the Boers was dissolved by the authorities. The Progressist ministry retired on June 21, having incurred the King's displeasure by submitting a measure attacking hereditary right, meant to apply to the peerage only, but not expressly restricted to that, which gave Prof. Afonso Costa, of the University of Coimbra, one of the Republican Deputies, an opportunity to discuss the conditions of the exclusion of the heir to the throne from the succession and the consequences that would arise. Senhor Ribeiro, the Conservative leader, formed a Cabinet on June 23, as follows: Premier and Minister of the Interior, Hintze Ribeiro; Minister of Foreign Affairs, Senhor Joarroyo; Minister of Finance, Anselmo Andrade; Minister of Justice, Campos Henriques; Minister of War, Pimentel Pinto; Minister of Marine, Teixeira Sousa; Minister of Public Works, Pereira Santos. The new Cabinet announced that it would watch attentively over colonial affairs, and would seek by means of reciprocal treaties to further Portuguese products in foreign markets; that it would also accomplish in their integrity the engagements made with the creditors of the state according to the law of May 20, 1893. In November new elections were held. The chief Republican paper was suppressed and the Government wrested all three Oporto seats from the Republicans. The results gave the Ministerial party 90 seats, the Opposition 23, and Independents 9.

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—The following exhibit of the statistics of this Church is from the Comparative Summary by W. H. Roberts, stated clerk, published with the journal of the General Assembly for 1900: Number of synods, 32; of presbyteries, 232; of churches, 7,750; of ministers, 7,467; of candidates, 973; of licentiates, 380; of elders, 28,605; of deacons, 9,895; of communicants, 1,007,689; of members of Sunday schools, 1,058,051; of members added on examination during the year, 57,183; of baptisms, 21,620 of adults and 26,253 of infants; of churches organized, 165; of ordinations of ministers, 286. Amount of contributions: For home missions, \$1,088,367; for foreign missions, \$822,811; for education, \$117,139; for Sabbath-school work, \$117,702; for church erection, \$115,852; for the Relief fund, \$97,055; for the freedmen, \$161,537; for synodical aid, \$91,551; for aid for colleges, \$213,731; for the General Assembly, etc., \$79,833; for congregational purposes, \$11,372,283; miscellaneous contributions, \$776,330.

The Board of Home Missions reported to the

General Assembly that its total receipts for the year had been \$733,124, and its expenditures \$730,548; hence it had closed the year with a balance of \$2,576. It had employed 1,371 missionaries, including 25 Mexican and Indian helpers, with 372 missionary teachers, and returned a total membership in the mission churches and stations of 77,181, with 88,510 attendants in the congregations; 16,311 Sunday schools, with 117,773 members thereof; 223 Sunday schools organized during the year; 3,229 baptisms of adults and 3,523 of infants; 7,776 additions on examination; 33 churches organized, and 16 reached self-support; 57 church edifices built, at a cost of \$115,483, and 273 repaired and enlarged, at a cost of \$54,551; 1,519 church edifices in all, having a total value of \$2,943,234; 399 parsonages, valued at \$412,530; and \$89,258 of church debts canceled.

The Board of Education had under its care 294 students in colleges and 399 in theological seminaries. Its entire receipts had been \$93,194, and its expenditures \$85,977.

The Board of Relief had had 903 names on its list—of ministers, widows, orphan families, and other beneficiaries. One hundred and eleven names had been added during the year to the roll of annuitants. The honorably retired roll of ministers more than seventy years old who had been thirty years in service and desired to receive the annuities of the board (not exceeding \$300 each) contained 127 names, while 232 ministers had availed themselves of its privileges since 1880. The average amount paid to ministers on this roll was \$282.87, and the average amount paid to all annuitants was \$199.48 annually. The receipts of the board from all sources had been \$194,890.

The total resources for the year of the Board of Aid for Colleges and Academies had been \$181,576.

The Board of Missions for Freedmen had under its care 199 ministers, 339 churches and missions, 19,588 communicants, 1,841 of whom were added on examination during the year, 324 Sabbath schools with 10,582 scholars, and 64 day schools with 231 teachers and 9,132 pupils. Its entire receipts for the year had been \$155,033, or \$5,600 more than the receipts of the preceding year. The board had nearly \$1,000,000 of permanent property. The freedmen had raised more than \$71,763 for self-support during the year, none of which was included in any of the accounts of the board. Industrial instruction was given at all the important schools.

The total receipts of the Board of Foreign Missions had been \$957,521, and its total disbursements \$935,351. The board had under its care 117 principal stations and 1,172 out stations, with 720 American missionaries (including 233 ordained ministers, 46 physicians, 13 lay missionaries, 253 married women, 149 single women, and 26 woman physicians), 1,701 native missionaries (including 170 ordained ministers, 398 licentiates, and 1,133 other workers), 626 organized churches, 37,820 communicants, 66 students for the ministry, 702 schools having 23,929 pupils, and 26,611 pupils in Sabbath schools. The number of additions during the year was 4,442. The missions were supplied with 8 printing establishments, and 35 hospitals and 47 dispensaries where 321,836 patients had received treatment.

The Woman's Board of Home Missions in its annual report returned 126 schools and missions and 372 missionaries and teachers, with 8,446 pupils. Its total receipts had been \$345,857, of which \$55,736 were for the freedmen's depart-

ment. During the twenty-one years of its existence the board had secured \$5,082,090, of which amount \$750,000 had been invested in buildings.

The one hundred and twelfth General Assembly met in St. Louis, Mo., May 17. The Rev. Charles A. Dickey, D. D., was chosen moderator. The special committees on the celebration of the advent of the twentieth century appointed by the previous General Assembly reported the details of the plan which had been adopted in general by that body for the observance. They included special religious services during the week of prayer of 1901; the setting apart of the first Friday of the meeting of the General Assembly in that year for appropriate exercises, including a review of the history of the Church during the nineteenth century at the morning session, a forecast of the outlook for the twentieth century at the afternoon session, and popular addresses at a session to be held in the evening; the raising of a special memorial twentieth century fund for the endowment of Presbyterian academic, collegiate, and theological institutions, for the enlargement of missionary enterprises, for the erection of church buildings and the payment of debts upon churches and educational institutions, and for the other work of the boards at the option of the donors; and the constitution of a committee of four ministers and three elders, with headquarters at Philadelphia, to have a general supervision of the enterprise. It was also arranged that the meeting of the General Assembly of 1901 should be held in Philadelphia, where the body was organized. Numerous overtures having come to the Assembly respecting a revision of the Confession of Faith, the subject was referred to a subcommittee of the Committee on Bills and Overtures. This committee reported concerning the overtures that, of 38 presbyteries sending them in, 8 asked for revision as their first preference, 1 asked for a new declaratory statement, 20 asked for a new and shorter creed, and 9 asked for a committee to consider the whole subject and report to the next Assembly. "Your committee," the report continues, "deem these overtures of such nature and number as to justify some action on the part of the Assembly. But the overtures are of such variety and suggest so many paths of process that they hardly furnish sufficient data to justify a distinct trial of any of the plans proposed. To enter at once either upon the revision of our present creed or the preparation of an explanatory statement would be to commit ourselves to undertaking some one of the proposed methods of creedal change, without sufficient knowledge of the mind of the Church to warrant reasonable expectation of approval. On the other hand, to decline all action would be to ignore a condition that seems to demand attention, and which involves a wide misrepresentation of our doctrinal position. We therefore recommend, first, that a committee of 15—8 ministers and 7 elders—be now appointed by the moderator to consider the whole matter of a restatement of the doctrines most surely believed among us, and which are substantially embodied in our Confession of Faith. Second, that this committee be enjoined diligently to pursue their inquiries, seeking light and knowledge from every available source, and to report to the next General Assembly what specific action, if any, should be taken by the Church. Third, that to further the work of the committee the presbyteries be and are hereby invited by the Assembly to take action at their approaching fall meetings and through the Assembly's stated clerk to report said action to

the committee, whether suggestive, revisional, supplemental, or substitutional changes, or no change at all." The recommendations of the committee were adopted. The committee appointed in pursuance of them consisted of the Rev. Drs. Charles A. Dickey, moderator, chairman; Herrick Johnson, Samuel J. Niccolls, Stephen W. Dana, Daniel W. Fisher, William McKibbin, Samuel P. Sprecher, George B. Steward; and elders E. C. Humphrey, Daniel W. Noyes, William R. Crabbe, John E. Parsons, Elisha Frasher, Benjamin Harrison, and John H. Harlan. A change in the method of appointing the committees of the Assembly had been suggested by the presbytery of Peoria in an overture sent to the preceding General Assembly, but had not been acted upon by it. The plan had become known throughout the Church as "the Peoria overture." The committee to whom the subject was referred presented majority and minority reports upon it. The majority report recommended that the rules bearing on the subject be amended so as to include a provision that "the moderator shall upon the organization of the Assembly appoint a committee of ministers and elders to aid him in the appointment of standing committees, said committee to be composed of 21 commissioners from different parts of the Church, not more than 2 of whom shall be from any one synod." The minority report was the Peoria overture itself, and was as follows: "For the purpose only of electing standing committees the General Assembly shall be divided into 22 electing sections of as nearly as practicable equal size, by combining the smaller synods and dividing the larger by presbyteries where necessary. The standing committees, except those on mileage and finance, shall be numbered consecutively; the electing sections shall be numbered in like manner.

"The standing committee shall consist of 11 ministers and 11 elders, excepting those on mileage and finance, which shall each consist of 11 elders. On odd-numbered years each odd-numbered section shall elect 1 minister for each odd-numbered committee, and 1 elder for each even-numbered committee, and 1 elder for the finance committee. On the same year, each even-numbered section shall elect 1 minister for each even-numbered committee, and 1 elder for each odd-numbered committee, and 1 elder for the mileage committee. On the even-numbered years this order shall be reversed. The standing committees shall elect their own chairmen." The minority report was substituted by amendment for the majority report, and was adopted. In the matter of "vacancy and supply" the Assembly provided for the constitution of a committee in each presbytery to have supervision of all vacant churches within its bounds, whose duty shall be to prepare and keep a list of such churches and of the effective unemployed ministers of the presbytery, and to arrange for the supply of the churches from the list of available ministers and from such other sources as may be suggested by correspondence; and, further, of similar committees with like duties for the synods. The case of the Rev. Dr. A. C. McGiffert, charged with having published doctrines contrary to the Presbyterian faith in his book *The Apostolic Age* (see *Annual Cyclopaedia* for 1898, page 651, and 1899, page 728), having been removed from the purview of the General Assembly by his withdrawal from the Presbyterian Church, a minute was adopted declaring that "the case be and is hereby closed." An amendment proposed to the section of the Form of Government defining the constitution of a pres-

bytery prescribing that only active members shall vote was sent down as an overture to the presbyteries. The resolutions on Sabbath observance pronounced any and all secularization of the Christian Sabbath day destructive of its beneficent design and inimical to both public and private morality; declared the preservation of the Sabbath to be dependent on the action and influence of members of the Christian Church; and after particularizing various current forms of secularization, affirmed that "any and all efforts to promote commercial or business interests and financial gain at the expense of the sacred character and religious uses of the Christian Sabbath are inimical to the best interests of society and the state."

The McGiffert Case.—The case of Prof. A. C. McGiffert, of Union Theological Seminary, charged with the publication of heresies in his book on *The Apostolic Age*, was referred by the General Assembly of 1899 to the Presbytery of New York for action. When it was afterward brought up at a meeting of the presbytery the charges were dismissed. At the semiannual meeting of the presbytery, April 9, Prof. McGiffert presented a letter requesting that his name be dropped from the rolls. In making this request, the writer declared that his withdrawal was not because he regarded the charges of heresy preferred against him as well founded, or because he recognized the justice of the accusations that had been made—for he still believed that his views were in harmony with the faith of the Presbyterian Church and of evangelical Christendom in all vital and essential matters; but he could not feel that it was his duty to go through the trial before the General Assembly which an appeal from the action of the presbytery would precipitate, and needlessly to prolong the agitation of the subject. He regarded the principles on which heresy trials are conducted and their judgments governed as, from the point of view of the honest seeker after truth, fundamentally unsound. "Only by patient study and free discussion can the truth be reached, and the attempt to determine the correctness or incorrectness of historical conclusions by their conformity to a confessional standard tends to obscure truth's supremacy and to promote indifference to its claims." Prof. McGiffert had felt it his duty to maintain as far as he could the historic rights of Christian scholarship and the historic liberty of Christian thought and speech within the Presbyterian communion by refusing to withdraw even at the suggestion of the General Assembly. "For while it can matter little whether the particular views I hold are pronounced sound or unsound by an ecclesiastical tribunal, it matters much whether a great Christian communion like the Presbyterian Church, which has stood in the past for stalwart, intellectual Protestantism, shall commit itself irrevocably to the unprotestant policy of closing its eyes to all new light, and so make it increasingly difficult, if not impossible, for honest seekers after truth to do within its ranks their part of the one great work to which God has called his people." He had therefore remained within the Presbyterian Church, and had even been prepared to face a trial, but the action of the presbytery in dismissing the charges against him had relieved him from the particular responsibility resting upon him, and made it possible for him to withdraw without detriment, and even, he believed, with advantage to the cause of truth and liberty.

The presbytery unanimously, by resolution, expressed the sincere personal affection of the members for Prof. McGiffert.

Prof. McGiffert's name was presented for admission to the Manhattan Congregational Association April 11, and was referred according to the rules of the body.

Revision of the Confession.—The committee of the General Assembly on revision of the creed in August sent out a note to the presbyteries reciting the action of the General Assembly, and asking them a number of questions the answers to which would be helpful to a full and clear understanding of the mind of the Church. These questions, the committee explained, were simply suggestive, putting no restrictions upon the presbyteries except that it should be remembered that the committee was not empowered to consider any suggestions conflicting with the system of doctrine taught in the Holy Scriptures and contained in the Confession of Faith. The questions were: " (1) Do you desire a revision of our Confession of Faith? or (2) do you desire a supplementary, explanatory statement? or (3) do you desire to supplement our present doctrinal standards with a briefer statement of the doctrines 'most surely believed among us,' expressing in simple language the faith of the Church in loyalty to the system of doctrine contained in the Scriptures and held by the Reformed churches? or (4) do you desire the dismissal of the whole subject, so that our doctrinal standards shall remain as they are, without any change whatever, whether revisional, supplementary, or substitutional? If your preference is for revisional action, state in what direction and to what extent you would have revision undertaken. The revision reported to the Assembly in 1892 might be helpful as a basis for judgment. If your preference is for an explanatory statement, indicate what specific points in the Confession the statement should cover. The committee considers it as quite evident that due regard to the above questions and suggestions may be of great service in contributing to a better knowledge of the mind of the Church on this important matter. The committee also would respectfully request the presbyteries, in reporting their action, to state the votes both in the affirmative and the negative." The committee met Dec. 8 to examine and compare the answers made by the presbyteries to their questions. They found: "1. That the returns plainly indicate that the Church desires some change in its credal statement. 2. These returns indicate plainly that no change is desired which would in any way impair the integrity of the system of doctrine contained in the Confession of Faith. 3. These returns also indicate that a large plurality desire that changes should be made by some new statement of present doctrines. 4. These returns also indicate a desire upon the part of many presbyteries for some revision of the present Confession." The committee unanimously agreed to recommend to the General Assembly that some revision or change be made in the confessional statements. The determination of the method of formulating the changes that seemed to be desired was referred to a subsequent meeting of the committee, and a meeting was appointed to be held Feb. 12, 1901, when it was expected the preparation of a statement to be presented to the General Assembly would be considered.

II. Presbyterian Church in the United States (Southern).—The following is a summary of the statistics of this Church from the table published by the stated clerk, William A. Alexander, with the journal of the General Assembly of 1900: Number of synods, 13; of presbyteries, 79; of churches, 2,959; of ministers, 1,461; of candidates, 317; of licentiates, 70; of ruling elders, 8,845; of deacons, 7,733; of communicants,

225,890; of baptized noncommunicants, 40,629; of teachers in Sunday schools, 20,881; of pupils in the same, 141,507; of members added on examination during the year, 7,733; of baptisms, 3,051 of adults and 4,853 of infants; of licensures, 63; of ordinations, 48; of churches organized, 69. Amount of contributions: For home missions (assembly's), \$26,658; for evangelistic work (local), \$123,016; for the Invalid fund, \$15,030; for foreign missions, \$141,507; for education, \$90,612; for publication, \$7,848; for colored evangelization, \$11,332; for the Bible cause, \$4,803; for pastors' salaries, \$805,945; presbyterial, \$16,052; congregational, \$667,268; miscellaneous, \$122,875.

The increase in the number of communicants for the year was 4,696, or about 2 per cent. of the membership. The average contribution was about \$9 per member.

The Executive Committee of Home Missions reported to the General Assembly that its total receipts for the year, including the balance of \$12,088 from the preceding year, had been \$43,690. Its expenditures on field work had been \$30,433. It had supported, fully or partly, 137 missionaries for the whole or part of the year. Six hundred dollars had been loaned from the regular loan fund to four churches, making the total amount of loans to white churches during the fourteen years since the fund was instituted \$7,905. Of this sum, \$3,078 were outstanding and the Assembly had canceled \$404 on two loans. Two hundred and fifty-five dollars had been loaned about ten years to five colored congregations, of which \$128 had been returned, and the Assembly had canceled the rest. From the Moore Church Erection fund, the total assets of which were given as \$5,244, \$1,450 had been loaned to five congregations. Since this fund had come into the treasury loans amounting to \$6,275 had been made to 24 churches, and \$3,709 had been paid back. The regular loan fund loans were made as debts of honor without interest; the loans from the Moore fund were secured by mortgage on the church property. The resources of the Invalid fund for the year had been \$15,370, and from it \$13,856 had been paid to 149 beneficiaries—ministers and widows and families of ministers. Ten new ministers and five families of ministers deceased had been added during the year to the list of beneficiaries. In addition to the ordinary work of the committee, the report presented the conditions of its work in the Indian Territory and New Mexico, and among Mexicans in Texas.

The Executive Committee of Education for the Ministry reported all but two of the presbyteries as co-operating with it—a larger number than for many years before. It had received from all sources \$18,335, the receipts resulting from the regular collections having been the largest since 1895. One hundred and ninety-five beneficiaries had been enrolled, or 20 less than in the previous year. The proportion to the entire number of candidates of those aided through the committee was remarked upon as being very large. Three of the persons aided were strangers, a fact which suggested doubts to the committee as to the legality of extending aid to such persons. On this subject the Assembly advised sessions and presbyteries not to receive candidates who had been rejected or dropped by other presbyteries or ecclesiastical bodies without correspondence with such bodies.

The Executive Committee of Colored Evangelization had received \$8,454 on the general fund for colored evangelization and \$539 on the special or improvement fund of Stillman Institute—the whole being an increase of about \$1,000 over the

previous year. Its work had been extended by entering new fields, and it had aided in the construction of two churches and the purchase of one manse. Work done by white people in the mission Sunday schools for colored people was especially mentioned, and comprised 179 teachers instructing 1,987 pupils in 37 Sunday schools. Fifty-three ministers had been sustained in whole or in part by the committee, some of them having been otherwise supported by white presbyteries. The total sum of \$3,094 had been paid to colored ministers and churches. Report was made of the work of Stillman Institute, Tuscaloosa, Ala.; Ferguson-Williams College, Abbeville, S. C.; and North Wilkesboro Industrial Institute, North Carolina. A preachers' institute of colored ministers had been held during ten days in June, 1899, at Stillman Institute; but while the object of instructing the ministers was successfully pursued, the committee had failed to accomplish the other object which they had hoped to promote there, namely, the completion of the organization of the Independent Colored Presbyterian Church. This organization, which had taken the name of "The Afro-American Presbyterian Church," was opposed as a separate church by the two largest and most influential colored presbyteries—those of Ethel and Central Alabama—and it was doubtful whether those adhering to it would be able to sustain it as a vigorous, independent body. The Assembly's standing committee on this work insisted, however, that independent organization was the wisest solution of the questions relative to colored Presbyterians, and that that end should be kept in view by the Church.

The Executive Committee on Publication reported that the net assets of the publishing house were \$116,942. An increase of a little more than 25 per cent. had taken place in the business. The colportage work, also, had nearly doubled, and grants to an increased amount had been made. Four young men had been employed during the vacation of the Theological Seminary, and reported 18 Sabbath schools organized, with 70 teachers and 663 pupils.

The receipts for the year of the Executive Committee of Foreign Missions had been \$161,161, an increase over the previous year of \$16,171. The number of additions to the mission churches was 642. The committee expressed the conviction in its report that the principle of the subordination of the educational to the evangelistic side of the missionary work should be adhered to. Steps which had been taken to call the attention of the King of the Belgians to certain acts committed by the Zappo Zaps in the Congo Free State were approved by the General Assembly; and that body voted acknowledgments to the Methodist Episcopal Church, South, and to the Presbyterian Church in the United States of America for courtesies given in the mission fields, and to the Baptists for desires expressed in favor of co-operation and comity.

Seventy-four presbyteries reported 2,063 Sunday schools, with 18,791 officers and teachers and 131,561 scholars enrolled, and an average attendance of 94,163. These schools had contributed for all objects \$87,100. The General Assembly recommended that a general collection be taken in the Sunday schools for the advancement of the Sunday-school interests of the Church, and that at least one Sunday-school institute be held each year within the bounds of every presbytery.

The General Assembly met in Atlanta, Ga., May 17. Judge J. W. Martin, of Arkansas, was chosen moderator. The "permanent committee" appointed by the previous General Assembly to consider certain overtures on the subject of the

Church and Christian education, reported that its work had been mainly directed to securing the attention of the synods and presbyteries to the paper which had been adopted by the Assembly (see Annual Cyclopædia for 1899, page 730). Fifty-seven presbyteries had approved and recommended the paper and appointed permanent committees on Church and Christian education. Six presbyteries had indorsed or approved or commended the constitution and plan of organization proposed, but declined for the present to appoint permanent committees, while other presbyteries had failed to take definite action. Only one had expressed disapproval of the paper. Five of the 12 synods had approved and commended the plan, and had appointed permanent committees. The result of the canvass was regarded as indicating a greater interest in the subject than had been anticipated. Along with its report, the committee submitted a draft of a constitution for the proposed educational organization. It also communicated an enumeration of existing schools actually or virtually under Presbyterian control, which included 6 theological schools, 10 colleges and universities for young men, 41 colleges and seminaries for young women, 23 co-educational schools and colleges, 33 academies and high schools for young men, 7 orphanages, 9 Indian schools, and 6 colored schools. The committee was reappointed. The committee engaged in the preparation of a new hymn book reported progress. The old Psalms and Hymns was made the basis of the new collection, and a brief formal statement was presented of the rules and principles by which the committee had been guided in selecting and arranging the hymns and tunes. An effort to raise \$1,000,000 for the permanent work of the Church, to be known as the Twentieth Century fund, was approved, and a committee, consisting of a minister and an elder from each synod, was appointed to have general management and oversight of it. The object of the fund was defined to be "to promote and put upon a surer basis the cause of Christian education; to endow and equip more fully our theological seminaries, our schools, colleges, and other institutions of learning; . . . and to found such new institutions of similar character as may seem advisable." The Assembly advised that this movement should not interfere with or displace plans that were now in operation in different parts of the Church looking to the same end, but should rather seek to unify all these local efforts and stimulate and encourage them through sympathetic co-operation. The synods were invited to appoint each a committee of three to co-operate with the Assembly's committee. A committee was appointed to prepare a catechism on the nature and government of the Church. The Assembly declined to grant the prayer of an overture asking for the insertion of a clause in the Confession of Faith, declaring that all dying in infancy are elect infants and regenerated, on the ground that "the present language of the Confession can not, by any fair interpretation, be construed as teaching that any of those who die in infancy are lost"; and this answer was ordered printed as a footnote in future editions of the Confession of Faith. The report of the Permanent Committee on the Sabbath, finding the desecration of the Lord's Day generally increasing, urged upon all the presbyteries the duty and responsibility of holding up the subject of more faithful observance constantly before the churches, with a view of awakening a deeper interest, and warned the people of the Church against the great danger of becoming through their patronage "partakers of other men's sins" by having anything to do

with any of the great agencies of Sabbath desecration. A special pastoral letter on worldly amusements (including the dance, the theater, and the card table) affirmed that "Christians can not afford to do those things which are looked upon as belonging peculiarly to the world, and by doing which the line of separation between the world and the Church is erased or obscured . . . because experience shows that persons engaging in worldly amusements are easily led into such indulgences as are wrong in themselves. . . . Worldly amusements and the company into which they often bring those engaged in them are not favorable to growth in grace and loving service of God in the Church. It can not be denied that those who indulge in worldly amusements do not become eminent for piety, do not hunger or thirst after God, and do not excel in Christian work. It is touching such matters as these, not things evil in themselves only, but also things considered evil or associated with evil, that Christians must practice self-denial and lead lives which will mark them as separate from the world." In answer to an overture touching the introduction of the theatrical and spectacular into the programmes for Children's Day, the Assembly directed the exercise of the greatest care in the preparation of such programmes, "to provide only that which is scriptural and appropriate."

Afro-American Presbyterian Synod.—The Synod of the Afro-American Presbyterian Church met at Bethel Church, near Dillon, S. C., Nov. 15. The Rev. J. M. Coleman was chosen moderator. At a popular meeting held in the interest of education, Ferguson-Williams College and the Academy at Wilkesboro, N. C., were reported as doing well except that Ferguson-Williams College was burdened with a debt of \$5,000. A popular meeting was held in the interest of home and foreign missions. All the presbyterial records were examined and approved with one exception. The next meeting of the Synod was appointed to be held in Abbeville, S. C., in November, 1901.

III. United Presbyterian Church in North America.—The statistical reports of this Church for 1900 give it 13 synods, with 68 presbyteries. The whole number of ministers is 997, of whom 684 are registered as pastors and stated supplies and 313 as "without charge"; number of licentiates, 75; of licensures during the year, 26; of students of theology, 69; of ruling elders, 3,919; of congregations, 996; of pastoral charges, 821; of congregations organized during the year, 20, while 7 were dissolved; of mission stations, 486, of which 468 were in the foreign field; of members, 128,836, of whom 115,901 were in America and the rest in the foreign missions; of members received on profession during the year (in the whole Church), 6,517; of baptisms, 3,961 of infants and 1,326 of adults; of Sabbath schools, 1,171, with 12,655 officers and teachers and 116,091 pupils; of Young People's Societies, 1,029, with 40,011 members. Amount of contributions (in America): For salaries of ministers, \$807,456; for congregational purposes, \$587,118; for the boards, \$282,202; for general purposes, \$137,518; total for America according to the footings of the table, \$1,614,294; total for the Church, \$1,637,425; average per member in America, \$14.06; average salary of pastors in America, \$1,039. Nineteen houses of worship had been erected during the year, at a total cost of \$125,755, and 9 parsonages at a total cost of \$17,197.

In the list of presbyteries, the Presbytery of Egypt, having been constituted a synod, appears divided into three new presbyteries, those of the Delta, Thebes, and the Thebaid.

The forty-second General Assembly met in Chicago, Ill., May 23. The Rev. Dr. J. P. Sankey was chosen moderator. Much attention was given to discussion concerning the administration of the article of the testimony on secret oath-bound societies. The subject had already received a large degree of consideration by pastors in their regular work, but had only within the past year become a matter of public discussion. While there had not been any material change in the sentiment against these societies, their multiplication had caused considerable difficulty in the admission of new members. A number of memorials on the subject had been sent in to the previous General Assembly, and it had appointed a committee to take it into consideration and report to the present Assembly. The report of this committee emphasized the importance of the question, and insisted that no backward step should be taken in the testimony of the Church concerning it, but that its unanimous judgment was that if changed at all, the expression should be strengthened rather than weakened. Only a change in the provision for administering the testimony was demanded to bring the Church into a closer alignment with Christ's teaching of discipleship. Certain modifications in the reading of the articles bearing upon the questions asked candidates for membership were recommended. The paper was referred after discussion to a special committee for revision and amendment, and its report was referred to a committee to report to the next Assembly, its conclusions to be published in the papers three months before the meeting of that body. A committee appointed by the previous General Assembly on the promotion of spirituality reported setting forth what they had endeavored to do through the Church papers to awaken members to a deeper sense of their obligations and a better use of their privileges. The Committee on Union with the Associate Reformed Synod of the South reported that no progress had been made toward organic union, but evidence appeared that the union sentiment was growing, and the relations of the two bodies were becoming more intimate and cordial. A report was made upon a question from a synod concerning divine healing, to the effect that no doubt much of the teaching on that subject arose from a misrepresentation of Scripture on the subject of Christ's redemption and the function of Christian faith, and was repugnant to sanctified common sense. It was proper to inquire of persons holding to such doctrines whether their opinions were founded on ignorance of Bible teaching or were heretical perversions of the principles taught in the word of God, and whether the non-use of recognized means of relief or cure was an error of judgment or criminal negligence. Only in the latter case, after due trial, should members holding these mistaken views be deprived of their good standing in the Church. Great interest was shown in the work of the Board of Education, toward which every presbytery and the Young People's Societies had made contributions. A report on reform covered the subjects of temperance, the Sabbath, secret societies, and polygamy. The part relating to the Sabbath urged the responsibility of members, and seconded the request of the Presbyterian Assembly asking Congress and State Legislatures to make no more appropriations to expositions unless they agree to close their gates on that day. The Assembly decided adversely to the baptism by United Presbyterian ministers of children whose parents are at the time members of another denomination, as a violation of interdenominational comity. Appropriations were made to the various enterprises of the Church as

follow: To foreign missions, \$132,822; to home missions, \$94,141; to freedmen's missions, \$55,000; to church extension, \$55,000; to education, regular work, \$8,000; colleges and seminaries, \$25,000; to ministerial relief, \$8,000; to Assembly fund, \$14,500; to publication, \$500. In addition to these amounts, \$24,000 were pledged to foreign missions by the Woman's Board and other parties.

The contributions made by the Woman's Board of Missions to the funds of the Church amounted for the year to more than \$82,000. The reports made at the annual meeting for 1900 show that since its organization, in 1886, this society had contributed more than \$600,000. The board publishes a general missionary magazine and a magazine for juniors, and sustains a training school at Xenia, Ohio.

The Freedmen's Mission returned nearly 800 members, with 14 schools, having an enrollment of 3,024 pupils; 10 Sabbath schools, with 138 officers and teachers; and 89 missionaries, 11 of whom were ordained ministers. The contributions had increased during the year from \$857 to \$2,024. The policy of the board had been to provide ministers and teachers from among the colored. A charter had been obtained for Knoxville College, empowering it to confer academic degrees. The debt of the board was \$16,082.

The annual meeting of the Young People's Christian Union was held in Denver, Col., late in June. A gain of 47 senior and 31 junior societies was returned, with a large increase of contributions by the junior societies. The reports showed that the number of professions of faith among the juniors was equivalent to two thirds of the net gain in membership of the Church during the year. Resolutions were passed urging the keeping of the Sabbath holy, opposing the use and traffic in narcotics and alcohol in any form, and regretting the existence of the army canteen in opposition to the wishes of the great majority of Christians.

IV. Reformed Presbyterian Church in North America—Synod.—The following is a summary of the statistics of this Church for the synodical year 1899-1900, as given in the report made to the Synod in May. The numbers from 12 congregations are taken from the reports of the preceding year: Number of congregations, 113; of mission stations, 8; of ministers, 124; of licentiates, 19; of students of theology, 7; of communicants, 9,790; of attendants upon Sabbath schools, 10,449; of attendants of Young People's Societies, 2,169; total amount of contributions, \$104,718.

The Synod met at Cedarville, Ohio, May 30. The Rev. F. M. Foster was chosen moderator. Mr. Foster, who had been one of the delegates to the Ecumenical Conference of Missions, but had not attended on account of the use of instrumental music and of hymns other than the Psalms in worship, reported concerning his "attempt and failure to secure the silencing of the organ and the use of the divine Psalms in worship." The delegates to the General Council of the Reformed and Presbyterian Alliance in Washington in 1899 reported to the effect that the character of the proceedings of the council was conservative and thoroughly biblical, and that the Psalms were used exclusively in worship without the organ. Yet the opinion was expressed by the speaker that the Alliance was manifestly and thoroughly opposed to the Reformed Presbyterian principle as to praise. A committee on an International Convention of Covenanters which it was proposed to hold in America in 1901 reported that after having cor-

responded with all the ministers of the Reformed Presbyterian Synods of Scotland and Ireland on the subject, they did not consider the information received such as would encourage the synod to decide upon holding the convention at the time designated. A special session was given to the subject of national reform, which was defined by one of the speakers as being a movement not so much to get the word God into the Constitution (as the public regarded it) as "to get God in Christ into the hearts of the people so completely that they will themselves put Christ into the Constitution and laws of the world." A memorial was addressed to Congress and all State legislatures asking that they make no more appropriations for expositions in this country or other countries without the proviso that such expositions shall be closed on the Lord's Day. The officers of the Synod were appointed a committee to prepare a memorial to the next Congress asking the abolition of all Sunday mails and mail trains, the closing on the Christian Sabbath of the Post Office Department at Washington and of all post offices in the United States, and the prohibition of all business and labor in the entire Post Office Department on the first day of the week, the committee in person to attend to the presentation of the petition.

V. Cumberland Presbyterian Church.—The statistical reports of this Church, made to the General Assembly in May, give it 180,192 members, a gain of 2,614 over the previous year. They show also gains of 4 in the number of churches with installed pastors, 36 parsonages, 117 Sunday schools, 10,000 in Sunday-school enrollment, 123 in the number of additions and 566 in that of baptisms, and 35 ordained ministers, while the number of missions and congregations awaiting organization had nearly doubled. Reductions appear of 22 in the number of churches without ministers, of 85 in that of churches without Sabbath schools, and of 22 in the number of ministers without charge. Thirty-six churches had been dedicated during the year, costing in all \$97,895, all but \$4,810 of which was paid. The contributions for education, ministerial relief, synodical missions, and miscellaneous causes had increased, while those for foreign missions, home missions, and church erection had fallen off considerably, entailing a decrease of \$55,262 in the total contributions of the church for all causes of which the actual amount was \$677,491.

The seventieth General Assembly met at Chattanooga, Tenn., May 17. The Rev. H. C. Bird, of Uniontown, Pa., was chosen moderator. The report of the Educational Society represented that an unusual interest in education had been manifested during the year, consequent upon the appointment of an educational commission by the previous General Assembly. The presbyteries were as a rule demanding that their probationers reach the required standard of knowledge, and were dropping those unwilling to do so. The receipts of the society for all purposes had been \$11,932, its indebtedness was \$1,260, and its permanent fund amounted to \$7,700. The Educational Commission appointed by the previous General Assembly reported a plan for four grades of schools above the primary, to include academies, colleges (of which there are five), one university for the whole Church, and a theological seminary, all adequately equipped and correlated to one another. The Board of Missions and Church Erection reported concerning the missions in Japan, China (Hunan), Mexico, the Indian Territory, and home missions. The offerings for church erection had amounted to \$2,303, and the

total contributions of the Church for missions had been \$97,727. The Board of Ministerial Relief had on its list of beneficiaries the names of 47 ministers and 59 widows of ministers. Its total receipts from all sources had been \$10,074, and its endowment funds amounted to \$19,874. The Board of Publication returned gross receipts of \$31,069, besides rents from its real estate. The Permanent Committee on Sunday Schools reported upon the condition and work of those bodies, with plans for their more complete organization. The Permanent Committee on Christian Endeavor returned the offerings of the societies to missions as amounting to \$4,322. The Committee on Systematic Benevolence represented the interest in the subject to be increasing, their correspondence having quadrupled during the year, and submitted a scheme of measures for the further extension of the principle. The Historical Society had endeavored to interest the presbyteries and synods in its enterprise, had adopted a constitution and by-laws, and had fitted up suitable quarters for its collections. A memorial asking that the Rev. Dr. R. V. Foster be removed from his position as professor in the Theological Seminary was denied, Dr. Foster having appeared before the committee of the Assembly and affirmed his adherence to the Confession of Faith. An amendment to the constitution of the Church permitting the election of elders or deacons for a limited time when any church may so desire was adopted for submission to the presbyteries. A plan was adopted for a "centennial endowment" of the educational institutions of the Church, the total sum aimed at being \$1,000,000. The Assembly, adhering to a former decision that installation is essential to the pastoral relation, directed that ministers not installed be hereafter entered upon the minutes as "minister in charge." It also ordered that a ministerial letter shall not be accepted as valid after the lapse of one year, and that after two years from the date of such invalid letter the holder shall be regarded as having demitted the ministry. Constitutional amendments submitted by the previous General Assembly providing for special meetings of synods and of the General Assembly were found not to have been adopted. In the case of the enrollment of the name of Mrs. L. M. Woolsley as an ordained minister, the action of the Kentucky Synod directing the withdrawal of the name was affirmed. The report on Sabbath observance mentioned an improvement in the mind of the Church on the subject, and specified an increase in spiritual life rather than legislation as the means by which reform is to be brought about. The report on temperance condemned the license system, and urged voters to antagonize everything identified with the liquor interest.

Memorial of the Earliest Presbyterian Meeting in the United States.—A historical monument was inaugurated June 14, at Free Hill, Wickatunk station, near Freehold, Monmouth County, New Jersey, on the site of the Old Scots' meetinghouse, where the first presbytery of which any minutes exist was held, Dec. 29, 1706. A large assembly was present, in which the Northern and Southern Presbyterian Churches were officially represented. The Rev. Dr. A. N. Hullifield, moderator of the Synod of New Jersey, presided; the monument was described by the Rev. Allen Boyd, and other addresses were made.

VI. Presbyterian Church in Canada.—The statistical reports made to the General Assembly of this Church in June accounted for 2,942 pastoral charges, with 113,141 families connected with the churches and mission stations, 210,776

members, 10,118 of whom had been received during the year on profession of faith, 160,105 attendants upon Sabbath schools, showing an increase of 1,608, and 11,646 baptisms during the year. The total revenue of the Church amounted to \$2,384,897, an increase of \$114,241. The membership of the Young People's Societies had diminished by 3,765. A credit balance was returned in favor of every fund of the Church. The reports of Queen's, Halifax, Montreal, Knox, and Manitoba Colleges showed increase in almost every department, except in attendance of first-year students, where a decrease appeared. Morrin College, Quebec, had practically suspended operations, and the Board of Governors was considering what disposition should be made of the endowment fund.

The General Assembly met at Halifax, Nova Scotia, June 13. The Rev. Allan Pollok, principal of Halifax College, was chosen moderator. The financial report represented that, notwithstanding the unusually numerous special appeals, the contributions of the year had been greater than those of any year in the past, the investments yielded an average of more than 5 per cent. interest, while the expense of administration was less than 3½ per cent. Seven hundred and sixty thousand dollars had been subscribed toward the contemplated Century fund of \$1,000,000, and the information obtained from the answers to circulars sent out to congregations asking for estimates of the amounts they would probably raise indicated that the subscriptions would exceed the latter sum. The agent of the Ministers' and Widows' fund in connection with the Church of Scotland—a fund that had been left to be a subject of special account when the union of the churches constituting the Presbyterian Church of Canada was consummated—announced that the fund would in a short time be wound up, having fulfilled its purpose, when the capital of nearly \$100,000 would accrue to the general fund of the Church. The results of a conference between representatives of the Anglican and Presbyterian communions held in Toronto respecting the extension of biblical instruction in the schools having been made known to the Assembly, a resolution was passed that the Church should aim at securing the use of the Bible in the courses of all departments and grades of instruction. The proposed new Manual of Aids to Social Worship was subjected to criticism, and objections on account of features which were regarded as ritualistic, and was returned to the committee to report to the next General Assembly in a modified form. A proposition to take such steps as would secure ministers qualified to speak the languages of the Doukhobors, Galicians, and other settlers in the northwest who do not speak English was not favored in the Assembly. An overture asking for the establishment of a term service in the eldership was likewise rejected. These two measures were desired by churches in the western provinces to meet conditions temporarily prevailing there.

VII. Presbyterian Church in England.—The statistical returns of this Church, as reported to the Synod of 1900, give it 318 congregations, 74,541 members, 7,595 teachers, and 82,488 pupils in Sunday schools, and 8,929 members of young men's societies.

The income for foreign missions in 1899 amounted to £29,141, against £23,018 in 1898. Nineteen European ordained missionaries were employed, mostly in China, with 12 medical missionaries, 28 woman missionaries besides missionaries' wives, 28 native pastors supported by

their own congregations, 162 native evangelists and 48 native theological students; and 84 organized congregations, 121 preaching stations with 6,703 communicants, and 12 hospitals were connected with the missions. The income of the society had been £24,002. The Woman's Missionary Association had an income of £3,000 a year, and supported a large staff of woman missionaries in the foreign field. A plan it had in contemplation for the establishment of women's hospitals in China was approved by the Synod.

The Synod met in London, April 30. The Rev. John Watson, of Liverpool, was chosen moderator. The report of the Committee on Religion and Morals spoke of the widespread indifference prevailing in the land, as shown in diminished attendance at places of worship and diminished interest in the work and welfare of the Church. An overture asking the Synod to declare it legal for elders to dispense the Lord's Supper at home mission churches was "passed from," the proposition being regarded as illegal. A proposition to mark the opening of the twentieth century by a special movement for deepening the spiritual life of the Church was approved, and a synodical meeting of ministers and elders for prayer and conference was appointed to be held in Liverpool in October. A proposal to appoint a large commission of Synod to deal with matters which might arise during the intervals between the meetings of the body was referred back. Presbyteries and sessions were advised to co-operate with local councils in the simultaneous missions contemplated by the National Council of the Free Evangelical Churches to mark the opening of the new century. A resolution was passed expressing regret that "through the influence of the authorities of the Anglican Church Presbyterian soldiers in India have been deprived of the use of garrison churches erected in that country at the public expense for the religious worship of the Protestant soldiers, or have been hampered in the use of them by intolerable restrictions," and urging the Government to take steps to remedy the injustice complained of. It was announced that in view of the use of the designation Presbyterian by some of the Unitarian churches, a committee had decided to issue a brief explanatory and historical tract for use in districts where the confusion of names operated prejudicially to the interest of the Church.

VIII. Church of Scotland.—The statistical returns of this Church for 1899 give it 1846 churches and mission stations, with about 2,000 ministers, 648,476 communicants, and in 2,200 Sunday schools 20,834 teachers and 227,452 pupils.

Seven new churches, 3 halls, 2 manses, and 2 mission houses had been added to the property of the Church through the operations of the Highlands and Islands Commission. The amount available for distribution by the Association for Augmenting Smaller Livings was £9,916, or £1,366 more than in 1899. The capital fund had reached £85,956. The Jewish mission reported that of 2,188 children attending its schools, 1,402 were Jews. Eight thousand pounds sterling had been raised for the Jubilee Thank Offering fund, for which it was sought to raise £14,000. The Endowment Committee reported that 408 churches had been endowed since the institution of the scheme.

The combined income of the funds for foreign missions amounted to £50,691. One hundred and fifteen foreign agents were employed in the mission fields, from which were returned 9,891 baptized converts, 12,584 pupils in schools, and 1,063 under instruction in zenanas.

The General Assembly met in Edinburgh, May

24. The Rev. Norman MacLeod was chosen moderator. The report on education showed that the full number of students allowed by the regulations were enrolled in the training colleges, and that the decline in the number of young men students had ceased. The report of the Probationers' Committee, however, showed no improvement. There were only 108 students in the divinity halls, the number having fallen to that figure from 245 in 1889; and so far only 34 men had applied for license in the present year. The total number of probationers and unattached ministers was 329. The severity of the entrance examinations for the university faculties, the prevalence of materialistic views of life, the disinclination of young men of learning to sign the Confession of Faith, and the existence of a time of religious indifference were alleged by different speakers as causes for this decline. A committee appointed by the previous General Assembly to ascertain if the Church had the power to alter the terms of subscription to its Confession of Faith, reported that in the opinion of various eminent lawyers such a power did not exist. A deed to the possession of Iona Cathedral from the Duke of Argyll, its late owner, was presented to the Assembly, and the formal notification of the gift was marked by the expression of tributes to the memory and virtues of the deceased donor. The report on foreign missions represented that the past year had been one of unusual encouragement. The committee was free from debt. In the matter of a correspondence (mentioned in the Annual Cyclopædia for 1899) with the Indian authorities respecting the use of the churches in India by Presbyterian soldiers, satisfactory assurances had been received from Lord George Hamilton. The closing address of the moderator comprised a survey of the departing century and the outlook for the new one, in the course of which the speaker claimed that the ecclesiastical constitution of the Established Church combined state alliance with spiritual alliance in a manner more perfect than had ever been attained by any other church in Christendom.

IX. Free Church of Scotland.—The number of members of this Church at the end of 1899 was 296,685, showing an increase of 2,401. Of the 1,109 congregations (3 more than in 1899) 1,002 were regular sanctioned charges, the remainder being mission stations. The number of pupils in Sunday schools (215,874) was 4,383 less than in 1899.

The total contributions of the Church for all purposes amounted to £706,546, a decrease of £7,196 as compared with the previous year. The amount was, however, £45,000 in excess of the average of the last five years. The funds for the support of the ministry showed an increase of more than £3,000. The income of the Home Mission and Church Extension Committee was £12,292, an increase of £1,107.

The General Assembly met in Edinburgh, May 24. The Rev. Ross Taylor, D. D., was chosen moderator, and made an address on the influence which had been brought to bear upon religious thought during the nineteenth century, including the theory of evolution and biblical criticism. Holding that one unswerving purpose could be traced through all the processes in Nature, he asked if it was possible to believe that all this was due to force alone apart from intelligence or will. With all that had been accomplished in biblical criticism, he found that the great fact of Christian experience remained untouched. A report on the progress of the Church called attention to the fact that while the membership had increased

during the past four years by upward of 12,000, the number of Sunday-school scholars had fallen off to almost exactly the same extent. The increase during the past year had been 2,401. The articles of union with the United Presbyterian Church were brought up for final action, and were adopted by a vote of 592 against 29 for a motion that the Assembly take no further steps toward union—giving a majority of 563 in favor of union, as compared with 527 in 1899. Previous to this action a protest was offered declaring that the signers, in taking part in the discussion, did not admit the right of the Assembly to deal with union. This was tabled, but a declaration, presented after the vote was taken, setting forth that the signers refrained from further opposition on the understanding that no existing principles were to be renounced, was accepted. The report of the Church and State Committee, including a resolution in favor of religious equality, was carried by a vote of 337 to 96. On the presentation of the address to the Queen exception was taken to the use of the word "unavoidable" in describing the war in South Africa, and it was stricken out.

X. United Presbyterian Church of Scotland.—The statistical reports to the Synod of 1900 represent 594 congregations and 199,089 members, showing gains of 5 congregations and 1,613 members, with 138,193 young people under instruction; an income from congregational sources of £349,446—£6,160 less than in 1898—and total contributions of £392,116.

The Foreign Mission Board returned 115 congregations, with 30,431 members. The missionary staff included 165 fully trained agents, of whom 65 were ordained European missionaries, 17 medical missionaries, 23 ordained native pastors, 15 European evangelists, 45 zenana missionaries, and nearly 1,000 native helpers.

The report of the Committee on Union with the Free Church of Scotland, including the basis that had been accepted by the joint committees, was presented, with a verbal explanation that the standards accepted by both churches formed the basis of union, and that there was nothing in the arrangements made that impaired the rights of either church. The report was then adopted, after a brief discussion, by a rising vote. It was agreed that the Synod should meet again, Oct. 30, finally to dispose of the matter of union, the moderator being empowered to call a meeting previous to that time if it should be necessary. The Synod decided to continue the negotiations for the union of its presbytery in Ireland with the Irish Presbyterian Church. A resolution was passed in support of the disestablishment and disendowment of the state Church.

Union of the Free and the United Presbyterian Churches.—The General Assembly of the Free Church and the Synod of the United Presbyterian Church met in Edinburgh, Oct. 30, in special sessions for the purpose of completing the arrangements for union and consummating the act. A final report was made in the Free Church Assembly that 75 home presbyteries had voted in favor of union and 4 against it. A protest was then presented against the act, signed by 500 elders connected with 150 congregations which formed units in 42 presbyteries; but the right of these protestants to be regarded as representatives of the congregations to which they belonged was not recognized. Some amendments proposed to the uniting act having been voted down, the act itself was adopted by a vote of 643 in favor to 27 against it. In the United Presbyterian Synod all but 4 of the sessions were reported to

have responded in favor of the union, and the act was unanimously adopted. On the next day, Oct. 31, the two bodies met in their separate halls and marched thence to the Royal Institution, whence they went in a single procession, including 3,000 ministers, to Waverley Market, where the first meeting of the United Free Church of Scotland was held. The uniting act was adopted by a rising vote of the whole Assembly, and both moderators clasped hands in token of the consummation of the union. The Rev. Dr. Robert Rainy, principal of New College, Edinburgh, of the Free Church, was unanimously chosen moderator of the body, and made an address appropriate to the occasion. The members of the Free Church Assembly who opposed the final adoption of the uniting act held a separate meeting, at which they asserted a claim to be the rightful representatives of the Free Church.

XI. Reformed Presbyterian Church.—At the annual meeting of the Synod, held in Glasgow in May, the Rev. John McKee was chosen moderator. The reports on the schemes of the Church showed balances of £564 in favor of foreign missions, £40 of ministerial aid, £66 of the Synod fund, £157 of the Aged Ministers' fund, £105 of home missions, and £407 of the general fund. A balance was also returned in favor of the publication enterprise.

XII. Original Secession Church.—The annual Synod of this body was held in Glasgow, Scotland, in June. Prof. James Spence was chosen moderator. The financial secretary reported that the total sum of £5,353 lay to the credit of the various funds. A member of the Synod took exception to the policy of keeping so large a sum in hand, and advocated a generous and judicious expenditure on Christian work. The moderator, referring in his address to the subject of union, said that the century could not have been more grandly closed than by the union of two churches which had so much in common as the Free and United Presbyterian Churches, and regretted that all the Presbyterian churches had not been included in the scheme of union.

XIII. United Original Secession Church.—The Synod was petitioned to make some relaxation in the formula of questions used at the examination of ruling elders, in which an indorsement of the action of the fathers, and especially an acceptance of the descending obligation of the covenants taken during the history of the Church, are required. It refused to grant the petition.

XIV. Presbyterian Church in Ireland.—The General Assembly of this Church met in Dublin, June 4. The Rev. J. M. Hamilton, of Dromore, was chosen moderator. The financial reports showed as to the advance made by the Church during the past ten years, that the number of families had increased by 393, of communicants by 3,746, of pupils in Sabbath schools by 3,088, and the amount of collections for Sabbath school, missionary, and religious and charitable purposes by £12,219. There were now returned 754 ministers, 51 of whom were retired, and 166,630 communicants. The total income for ministerial support, £109,187, gave an average salary of £160 per minister.

XV. Welsh Calvinistic Methodist Church.—The statistics of this Church, presented to the General Assembly in June, give the following total numbers in the several items: Of churches, 1,345; of chapels and preaching stations, 1,557; of Sunday-school buildings, 880; of manses, 170; of ministers, 820; of deacons, 2,346; of communicants, 156,058; of children, 69,573; total in the churches, including 2,336 probationers, 228,147; with the

hearers included, the aggregate is given as 315,182. Increase is shown in all these items, that of ministers being 28, and that of communicants, 2,346. The total contributions of church members were £284,180, giving an average of £1 16s. 4½d. per member, and an increase of £37,815 over the contributions of 1898. The contributions for foreign missions had been £9,680. The mission in India returned 355 chapels and preaching stations, 28 ministers, 52 preachers, 4,237 communicants (an increase of 641), 3,573 candidates, 6,182 children (a total in the churches of 13,992), 18,587 hearers, and £4,872 of contributions by the native members. The report showed that on the Khama hills in India the natives in the churches were sending out missionaries, and the question of putting the churches on a self-supporting basis had been considered. The native churches had established a home missionary fund, in aid of which they were making a centenary collection. A report was also made of the mission in Brittany. The book room had become a source of financial profit. Nearly £40,000 had been contributed toward the proposed centenary fund of £100,000.

The General Assembly met at Llanberis, Wales, June 19. The Rev. Thomas Roberts, moderator-elect for 1900, having died since his election, the Rev. J. J. Roberts, of Portmadoc, was chosen moderator. A report was presented concerning the work done by the connection among Welshmen in London and the large towns of England and Scotland, and in the United States and Canada. Resolutions were adopted calling attention to the difficulty experienced in obtaining for the soldiers in service the privilege of worshipping in the non-conformist way.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada; area, 2,133 square miles; population in 1891, 109,088.

Government and Politics.—The political year in this little island province of the Dominion was very stormy. It began with the ministry of the Hon. D. Farquharson, a continuation of the Liberal Government of the Hon. F. Peters (which had originally won at the polls, and had been re-organized because Mr. Peters had removed to British Columbia), holding office by a majority of two. The other members of his ministry were Hon. Angus McMillan, Provincial Treasurer; Hon. James R. McLean, Commissioner of Public Works; Hon. D. A. MacKinnon, Attorney-General; and Messrs. J. W. Richards, Benjamin Rogers, A. McLaughlin, Peter Sinclair, and Peter McNutt without office or portfolio. Mr. MacKinnon, against all British and Canadian constitutional precedents, had held his office of Attorney-General, and continued to do so during the session, without a seat in the Assembly. He had been defeated in December, 1899, on appointment to that office, by A. P. Prowse, while another Conservative in a similar by-election had also won a seat. On May 8 the Legislature was opened in due form by Lieut.-Gov. P. A. MacIntyre, and it was adjourned on June 9 after a session in which the legislation attempted or effected was slight and the dominant feature was party contention. Of the majority of two possessed by the Government, one was Mr. Peters, who had not yet resigned his seat, though living 3,000 miles away. The other was lost by Mr. Wise, who had been originally elected as a Liberal, repudiating the Farquharson Government and resigning his seat before the Assembly met, with a view to having his position approved by his constituency. He declared that his resignation was handed to the Speaker on a distinct understanding with the Government that the

election would be held at once. Even without such an understanding, however, the unwritten constitution and permanent practice is to hold such an election within a short time. But the Government received the resignation, refused to hold the election during the session of the Assembly, and for a time held office by the casting vote of the Speaker. Finally it obtained the support of a Conservative member named Pineau. An exciting matter was an attempt by Mr. Wise to withdraw a resignation which he said had been given under false pretenses on the part of the Government, and to take his seat. Had he done so, the Government would have been beaten. They therefore expelled him from the House on the casting vote of the Speaker. In July, 1900, Mr. Wise was defeated by a large majority.

Finances.—The receipts of the province for the year ending June 30, 1899, were \$282,678, and its expenses \$276,789. The former amount included the Dominion subsidy of \$181,932, the provincial land tax of \$30,136, and the sale of debentures for \$17,089. The expenditures included \$125,531 for education, \$20,108 for the insane asylum, \$19,076 for interest on the debt, \$15,874 as subsidies to ferries and steamers, \$32,583 on roads and bridges, and \$15,317 on the administration of justice. The gross debt of the island was given in 1899 as \$500,000.

Prohibition.—The only legislative measure of importance marking the year was a prohibition bill similar in many respects to that of Manitoba. It was introduced by Premier Farquharson as a Government measure, and, after some criticism, was finally approved by the Opposition and carried. It prohibits the retail sale of liquor except for sacramental, medical, scientific, or mechanical purposes, under rigid restrictions. Wholesale trade is also prohibited except to physicians and druggists, and for consumption outside the province. It will go into effect on June 5, 1901. The penalties for unlawful sale are \$100 or three months in jail for first offense; \$200 or four months in jail for second offense; six months in jail, without the option of a fine, for the third and subsequent offenses. Provision is made for appointment of inspectors to enforce the act, and for one or more vendors for the city of Charlottetown and for each county electing to come under the influence of the act. The fines are to go into the provincial treasury excepting those collected in Charlottetown, one third of which will go into the city. No appeal is possible from any conviction or judgment rendered in the ordinary courts. Where the prosecutor is other than one of the inspectors provided by the act, such prosecutor is to receive one fourth of the fines collected.

Agriculture.—In 1898 there were 44,703 acres in wheat, with a product of 596,761 bushels; 7,594 acres in barley, with 147,880 bushels; 123,924 acres in oats, with 2,922,522 bushels; 43,521 acres in potatoes, with 7,071,308 bushels; 4,411 acres in turnips, with 2,005,453 bushels. There were also 84,460 bushels of buckwheat and an estimated product of 150,000 tons of hay. The live stock in the island in 1898 included 44,000 horses, 110,000 cattle, 170,800 sheep, and 51,000 swine.

Education.—The number of schools in 1899 was 582; teachers, 582; enrolled pupils, 21,550; average attendance, 12,941. The Government expenditure was \$125,531, and the school board (local) expenditure \$31,537.

Prince Edward Island Railway.—This chief factor in provincial transportation runs the whole length of the island, 154½ miles, and has a total mileage of 211. Its earnings in 1899 were \$165,012, its working expenses \$218,053, its deficit

\$53,041, its freight 57,968 tons, and its passengers 129,067 in number. The line is under the control of the Dominion Government.

Fisheries and Shipping.—The yield of the fisheries in 1898 was valued at \$1,070,206—a slight increase over the preceding year—and included a product of mackerel, \$36,564; herring, \$182,214; cod, \$101,488; lobsters, \$468,374; hake, \$43,246; smelts, \$32,424; oysters, \$105,936. The Dominion bounty received by the fishermen was \$10,188; the number of vessels was 24, with 125 men; the number of boats was 1,121, with 2,199 men. There were 230 lobster canneries, employing 3,120 men and having a plant valued at \$267,712. The fish exported were valued at \$541,585. The tonnage of seagoing vessels carrying cargoes to and from the island was 118,187.

PROTESTANT EPISCOPAL CHURCH IN THE UNITED STATES. A summary of the statistics of Church progress in the year shows the following: The number of dioceses in the United States is 59; missionary jurisdictions in the United States, 17; missionary jurisdictions in foreign lands, 8; clergy (bishops, 84; priests and deacons, 4,863), 4,947; parishes and missions, 6,677; candidates for holy orders, 506; ordinations—deacons, 157; priests, 156; baptisms, 60,052; confirmations, 43,419; communicants, 714,575; marriages, 19,854; burials, 35,300; Sunday-school teachers, 46,222; Sunday-school pupils, 430,901; total of contributions, \$16,102,467.52.

The gross receipts for missions for the fiscal year that ended Aug. 31 were \$1,004,349.69, being by far the greatest amount ever reported. The contributions for the work for which the board made itself responsible by appropriation were \$439,824.33; the amount received from legacies designated by the testators, either for domestic or foreign missions or for the use of the society, was \$255,104.59, of which sum \$186,734.59 was applied upon the liabilities of the society to Sept. 1, 1900, and \$50,000 was permanently invested. The number of parishes and missions contributing—217 more than the year before, and more than in any previous year—was 3,963, and the amount of church offerings was larger by \$51,731.98 than last year. The Lenten offering from Sunday schools, amounting to \$97,000.89, was the largest yet made, and was an increase of \$9,618.66 over last year's offering. The number of schools contributing was 3,338, a gain of 220 as compared with the previous year. Seven of the foreign mission schools gave a total of \$178.81—an average of \$25.54—a showing worthy to be compared with the \$28.06 representing the average gift from the Sunday schools in the United States.

The receipts for domestic missions (including a balance from 1899 of \$81,306.45) were \$544,312.91. The payments on account of white, Indian, and colored mission work amounted to \$275,247.04; specials were \$77,028.33; portion of Woman's Auxiliary united offering of 1898 applied to appropriations for domestic missions, \$9,084.76; legacy expenses (one half), \$103.75; one half amount paid to annuitants, \$926; one half cost of administration and collection, \$19,133.93; half cost of printing reports of the board, Spirit of Missions for the clergy, pamphlets and leaflets for gratuitous distribution, \$9,889.86; legacies paid to certain bishops at their discretion, \$2,500; returned to Standing Committee on Trust Funds, \$53,000; making the total payments for domestic missions \$446,925.57; and leaving for domestic missions and specials at the close of the fiscal year a balance of \$97,387.34. The salaries of the bishops and the stipends of the missionaries in 17 missionary jurisdictions were

paid, and in addition assistance was given to 40 dioceses and in Porto Rico. The general missionary to the Swedes and 2 missionaries among deaf-mutes in the West and South also were supported. The whole number of missionaries in the domestic field during the year, clerical and lay, male and female, receiving salaries or stipends, was 1,115, and the amount appropriated to the whole work (including the sums not directly chargeable to the dioceses) was \$316,861.17. The number of parishes and missions contributing for domestic missions was 3,728, 137 more than ever before.

The receipts for foreign missions (including a balance of \$64,101.21 for foreign missions and specials from 1899) were \$470,279.23. The payments on account of mission work amounted to \$227,552.96; specials were \$47,029.30; portion of Woman's Auxiliary united offering of 1898 applied to appropriations for foreign missions, \$5,000.53; legacy expenses (one half), \$103.75; one half amount paid to annuitants, \$926; one half cost of administration and collection, \$19,135.93; half cost of printing reports of the board, Spirit of Missions for the clergy, pamphlets and leaflets for gratuitous distribution, \$9,889.86; legacies for investment paid to standing committee, \$4,000; legacies paid to certain bishops at their discretion, \$2,500; to Mexico, \$950; returned to Standing Committee on Trust Funds, \$66,189.48; making the total payments on account of foreign missions \$383,277.81, and leaving for foreign missions and specials at the close of the fiscal year a balance of \$87,001.42.

The reports of the missionary bishops are encouraging. Though retarded by obstacles, substantial progress has been made everywhere. With the means at their disposal the bishops are reaching out as far as it is possible to go, and the outlook is more hopeful than ever; but all express the need of means to extend their work.

The statistics of work among the colored people in the 24 dioceses in which such work is done show that during the year the baptisms numbered 1,070, and the confirmations 712; there were 5,426 pupils in the day schools, 8,332 in the Sunday schools, and 1,476 in the industrial schools, the earnings of which amount to several thousand dollars annually; the contributions amounted to \$46,737.57, and the number of communicants was 7,865. There are about 80 colored clergymen laboring in the South, and more than 60 white clergymen. The appropriations for the work to Sept. 1 amounted to \$61,520.

Church work in Porto Rico has been carried on by 2 missionaries—the Rev. George B. Pratt, at San Juan, and the Rev. Frederick Caunt, at Ponce—the latter of whom was appointed this year. They have had constant help from Chaplain Brown, U. S. A., formerly a missionary in the domestic field. Porto Rico was placed in the charge of the Bishop of Chicago, and he having resigned, it is now under the care of the Bishop of Sacramento, and has been visited by the Bishop of Minnesota, who confirmed 12 persons.

In the Philippines one appointment has been made, that of the Rev. James L. Smiley. He has the co-operation of workers sent out by the Brotherhood of St. Andrew, of which there are 8 chapters, composed entirely of soldiers working among their fellows, and of Chaplain Pierce, U. S. A., who has raised more than \$20,000 toward establishing the work. Church work in the Philippines has been placed in the charge of the Bishop of Shanghai, who has visited the field.

The reports of work among the Swedes show

that 3,586 public services were held in the year, and nearly \$28,000 contributed; more than 1,000 persons were baptized, and nearly 300 confirmed, and the communicants number more than 8,000.

For mission work among the Indians \$54,158.89 was paid out by the board.

In Liberia 4 priests—young men of African descent, educated in the mission schools—were ordained, 5 postulants and 2 candidates for holy orders were admitted, 13 lay readers were licensed, and 3 additional catechists and teachers were commissioned; the corner stones of 1 school and of 2 church buildings were laid; 2 churches were consecrated; 329 persons, many of whom were adults, were baptized, and 184 confirmed; the contributions were \$2,538.24; and the number of communicants was 1,647, of whom 975 were aborigines.

Spiritual progress, and material as well, marked the course of the year in China until the outbreak of the disturbances there, after which time all missionaries and native workers were withdrawn from the mission stations. One native deacon was advanced to the priesthood, and 1, a graduate of the theological school, was admitted to the order of deacon; 3 of the foreign clergy also were advanced to the priesthood. The baptisms of natives were 411; confirmations, 151; communicants, 1,139; day-school pupils, 778; boarding-school pupils, 448 (all these pupils have lessons equivalent to Sunday-school work in the United States); contributions, \$2,799.02 (Mexican dollars). Science Hall, St. John's College, was completed and formally opened; the college chapel was inclosed and made the pro-cathedral; St. Hilda's school, at Wu-Chang, was erected and opened for the work of female education; and at several stations land was bought for chapels and schoolhouses. The translation of the Bible was continued, an abridgment of the Old Testament published, a translation of Gwynne's Catechism made, and the hymnal was revised and enlarged by the translation of additional hymns.

In Japan the most noteworthy event of the year was the consecration of the Rev. Sidney Catlin Partridge as Missionary Bishop of Kioto, the missionary district set apart in 1898. Statistics for the Japan mission give: Natives baptized, 260, of whom 173 were adults; confirmed, 207; communicants, 1,757; day-school pupils, 1,561; boarding-school pupils, 318; Sunday-school pupils, 1,852; contributions, \$7,518.02 (Mexican dollars). Three native priests and 2 deacons were ordained in Japan, and the missionary staff was strengthened by the arrival of 4 missionaries. Three churches were consecrated, and land for mission buildings was bought. It has been made clear that the intention of the rescript issued in 1899, which forbade any religious instruction in any schools in Japan licensed by the Department of Education, was to forbid religious instruction as part of the curriculum established by the department, but that there was no intention of interfering with such instruction if given either before or after the hours prescribed for the regular curriculum. A bill for the regulation of religions, aiming to bring all institutions, secular and religious, under the control of the Government, was introduced in the last Diet, but because of the opposition of the principal Buddhist sects it failed to receive a majority vote. Many of the provisions of this bill are calculated to hinder Christian work.

The baptisms in Hayti during the year numbered 141, the confirmations 31, and the contributions were \$2,388.77. At Léogane, the stronghold of Voodooism, a chapel was conse-

crated, and the chief Voodoo priest, or sorcerer, has become a convert. The bishop asserts that the time now is fully come to put into effective movement the auxiliary means of evangelization for which preparation has been made during the past twenty years—medical missions and industrial schools.

The routine work of the Mexican Church continues to be carried on by 7 presbyters and 5 deacons, who, with lay readers, make up the working force. The baptisms in the year were 83, and the confirmations 49; the offerings amounted to \$1,062; and the number of communicants was 727. The work in Mexico among English-speaking people has not been as successful as was anticipated.

The statistics of the chaplaincies in Europe show: Clergy, 14; organized chaplaincies, 9; baptisms, 5; confirmations, 40; communicants, 1,400; contributions, \$15,025.

On March 14, 1899, the Assyrian Mission Committee, which was organized in February, 1895, was made an auxiliary to the Domestic and Foreign Missionary Society. The amounts collected for this mission since March, 1899, aggregating \$2,603.69, have been applied to their respective purposes.

The receipts of the American Church Missionary Society amounted to \$68,353; the cash on hand Sept. 1, 1899, was \$45,685.17; the expenditures were \$103,955.52. The cash balance Sept. 1, 1900—\$10,282.65—with the special investments of \$26,302.50, gives \$36,645.15 as the real amount of available funds on hand for the society's general work and the beneficiaries of its trusts. Of this amount there is available and unappropriated for the general work \$3,162.20. The missionaries of the society in the domestic field number 20, who minister in 66 stations to 1,300 communicants, of whom 95 have been added during the year. The disbursements for Brazil for missions were \$14,115.55; for "specials," \$2,200.43; for church building, \$7,000. The Brazilian mission continues to develop, and from all established points of Church work there has come pronounced expression of acceptable result. During the year a theological school has been opened, and a new mission has been instituted; 101 persons were baptized; 147 confirmed; the communicants were 443; Sunday-school teachers, 27; pupils, 378; and contributions, \$4,991.32.

For Cuba the disbursements were: For missions, \$4,874.71; for "specials," \$1,670; for Matanzas Orphanage, \$3,337.07; for Havana Orphanage, \$482.70; for Guantanamo Orphanage, \$22; for church building in Bolondron, \$1,028.26; for church building in Havana, \$2,434.23; for Matanzas Cemetery certificate, \$500. In spite of the difficulties and small means good work has been done in Cuba. Four presbyters labor there, and a candidate for holy orders; these are assisted by 2 laymen and 5 or 6 ladies. The Bishop of Pennsylvania made a visitation to the island and confirmed 118 persons.

The Society for Promoting Christianity among the Jews continues, though slowly, to make converts; it is hampered by lack of means. The amount at its disposal during the year was \$6,268.88, the expenditures were \$5,827.41, and a cash balance of \$441.47 remains in the treasury.

The summary of work accomplished in the year by the Woman's Auxiliary and its junior department, in which 3,408 parishes and missions took part, shows: Contributions in money, \$210,841.50; and boxes valued at \$191,434.96. Of the total of \$402,276.51 the junior department gave money and boxes to the amount of \$31,148.23.

The American Church Building Fund Commission reports that in the year gifts amounting to \$4,725 were made to 27 churches, and loans to the amount of \$19,575 to 13 churches. The contributions to the permanent building fund were \$6,930.86; interest on loans and investments, \$16,603.02; loans returned by parishes and missions, \$33,008.90. The fund now amounts to \$356,158.01.

In Honolulu no transfer of the rights of the Independent Church there has yet been effected by the ecclesiastical authorities. The statistics of the diocese for 1900 show: Number of clergy, 8; church edifices, 7; parishes and missions, 9; baptisms, 119; confirmations, 75; communicants, 590; Sunday-school teachers, 22; Sunday-school pupils, 270; parish-school teachers, 15; parish-school pupils, 435; contributions, \$8,095.

The Right Rev. Mahlon Norris Gilbert, Bishop Coadjutor of the diocese of Minnesota, died March 2, 1900. The Right Rev. Henry Melville Jackson, bishop, whose resignation was accepted April 19, 1900, died May 4, 1900. The Right Rev. Richard Hooker Wilmer, second Bishop of Alabama, died June 14, 1900. Also the Church lost by death 97 other clergymen.

On Feb. 2, 1900, the Rev. Sidney Catlin Partidge, having been elected first bishop of the missionary jurisdiction of Kioto in Japan, was consecrated. Feb. 24, 1900, the Rev. Robert Codman, Jr., rector of St. John's Church, Roxbury, Mass., having been elected on Dec. 13, 1899, at a special convention of the diocese, third Bishop of Maine, was consecrated. On the same date the Rev. Charles Palmerston Anderson, rector of Grace Church, Oak Park, Ill., having been elected, on Jan. 9, 1900, by a special convention of the diocese, Bishop Coadjutor of Chicago, was consecrated. July 25, 1900, the Rev. Robert Woodward Barnwell, rector of St. Paul's Church, Selma, Ala., having been elected Bishop Coadjutor of Alabama, and the Right Rev. Richard Hooker Wilmer, bishop of the diocese, having died subsequently to the election, was consecrated, and became the third Bishop of Alabama. Nov. 8, 1900, the Ven. Reginald Heber Weller, Jr., B. D., Archdeacon of Stevens Point and rector of the Church of the Intercession, Stevens Point, having been elected, on Aug. 30, 1900, at a special convention of the diocese, Bishop Coadjutor of Fond du Lac, was consecrated.

Q

QUEBEC, a province of the Dominion of Canada; area, 228,900 square miles; population in 1891, 1,488,535.

Government and Politics.—The Government of Mr. F. G. Marchand faced the opening of a new year with a substantial majority and no serious shadow upon its future. The Legislature met on Jan. 18, 1900, and was opened by Lieut.-Gov. L. A. Jetté with a speech from the throne, in which he said:

"You will be called upon to consolidate our health and license laws, and amendments to the laws governing Crown lands, factories, and mining corporations will also be laid before you.

"As you will see by the public accounts, equilibrium is at last restored in our finances, and the ordinary receipts of the year show a surplus over all expenditure. With the kind assistance hitherto afforded my Government by the members, I am confident that this condition of affairs will continue; but to maintain this position it will be necessary to keep the expenditure within its present limits for some time. The settlement of accounts between the Government of the Dominion and that of the provinces of Ontario and Quebec has made marked progress during the year. Our province has obtained from the board of arbitrators an important award condemning Ontario to pay into the common-school fund an amount of nearly \$300,000. The Ontario Government has, however, notified my Government that it intends to apply to the Supreme Court for leave to appeal from that award. The question of the perpetual annuities to the Lake Huron and Lake Superior Indians, under the Robinson treaties, presented considerable difficulties which, by means of an agreement with the two other governments interested, my Government has been able finally to settle to its undoubted advantage.

"My Government has neglected none of the undertakings which it has pledged itself to promote. The education of youth has been the object of its particular care. It has increased the yearly grants to poor municipalities and to night schools; it has subsidized a normal school for female teachers which has just been founded in Montreal. The providing of free schoolbooks for primary schools

continues to receive its attention, and the system will shortly be inaugurated by the distribution of an excellent map of our province to all the schools in municipalities desirous of benefiting by the same. The school inspectors have given pedagogical lectures in their several districts, which were attended by a great many teachers, at the Government's expense; and in order to encourage them in the performance of their scantily remunerated task my Government has distributed money bonuses to the most deserving.

"To encourage colonization, my Government has made considerable efforts to open new roads in regions suitable for settlement, and many settlers have taken advantage of this to establish themselves there. Agriculture has also received a liberal share of encouragement from my Government, which has paid attention to improving the quality of butter and cheese, to propagating the best kinds of fruit trees, and to providing municipalities with better highways.

"In consequence of a judgment of the Privy Council, which was communicated last year to the Legislature, my Government has become vested with the ownership of a portion of the fisheries formerly under the administration of the Federal Government. The judicious application of the law passed on the subject last session, and of the game law, together with the part taken by the province in the New York Sportsman's Exhibition in 1899, have resulted in a marked increase in the provincial revenue.

"My Government has devoted its particular attention to protecting and profitably utilizing our immense forests, our splendid water powers and mineral resources. Thanks to its assistance, new industries continue to be established and populous manufacturing centers are springing up in regions until recently uninhabited. Within the past few years pulp wood has assumed such importance in connection with the prosperity of our population and the public revenue that my Government has deemed it advisable to take steps to increase the manufacture of pulp in this country, to the benefit of our industrial and laboring population."

One of the pledges made by the Government when in opposition was a promise to abolish the

official residence (Spencer Wood) at Quebec of the Lieutenant Governor. Since attaining office they had done nothing in this direction, and during the current session they came in for much criticism—not because they should have abolished the residence, but because they had promised to do so and not tried. Messrs. Le Blanc and Nantel and other Conservative leaders declared themselves in favor of its maintenance, but they could obtain no definite expression from members of the Government. On March 10 Mr. Marchand introduced a measure proposing to abolish the upper house of the Legislature. His resolution merely stated that "in the opinion of this house, it is desirable that the composition of the Legislature of this province be modified by the abolition of the Legislative Council." He referred to various attempts made in previous years to effect this end by both himself and the late Mr. Mercier. He declared that the Council cost about \$40,000 a year, which might be better expended on colonization; that Ontario and Manitoba got on very well without such a body, and so could Quebec; that it did not represent aristocracy and landed wealth, as did the House of Lords in England; that its members were mainly political partisans; that the Assembly did not need such a correcting and modifying influence; and that the people were in favor of its abolition. Mr. E. J. Flynn, leader of the Conservative opposition, declared, in reply, that the Government were insincere in the matter, or else they would have introduced a specific measure instead of an academic expression of opinion; that the Council was an essential part of the Constitution constructed at confederation; that the English minority in the province was almost unanimously in favor of its maintenance; that it was the safety valve of our system of Government, and represented the sober second thought of the people; that in the past it had defended important interests, and was regarded by the city of Montreal as the safeguard of its manufactures, capitalists, and property rights; that it represented the Quebec aristocracy of merit and intelligence in professional, industrial, and agricultural life; and that it had checked legislation subversive of public order and the Constitution. He moved an amendment as follows:

"That this house is satisfied with the present Constitution of this province, which is based on that of Great Britain, and does not desire any such innovation as that proposed, which would have but one result—that of imperilling our provincial institutions and very seriously affecting the interests of this province as an integral part of the Canadian confederation."

The original motion was carried by a party vote—38 to 21. In the Council itself a more formal bill was introduced and debated at length, the principal speeches being made by the Hon. Messrs. Archambault and T. Chapais. Eventually an amendment moved by the Hon. C. B. de Boucherville, a former Conservative Premier of the province, declaring that the Council should be maintained "in the interest of wise legislation and as a safeguard for precious privileges" accorded by the confederation act, was carried and the bill was defeated. On March 23 the Legislature adjourned after the Lieutenant Governor had assented to a large number of measures, among which were the following:

To authorize guarantee companies to become sureties before the courts.

Respecting mining companies.

To amend the mining law.

To amend the law respecting the sale and management of Crown lands.

To consolidate and amend the license law.

To amend the law respecting industrial establishments.

Respecting the construction of telephone lines.

To amend the law respecting taxes upon commercial corporations and companies.

To incorporate the Montreal Mining Exchange.

To incorporate the Great Northern Elevator Company.

To amend the law respecting admission to practice medicine.

To incorporate the Labrador Electric and Pulp Company.

Concerning the Board of Catholic School Commissioners of Montreal.

During the year important changes took place in the *personnel* of the Government. On Feb. 13 the Hon. Joseph Shebyn retired from his office of minister without portfolio in order to accept a Dominion senatorship. Late in September the Hon. F. G. Marchand, who had been an honorable and much respected Premier, died, and on Oct. 3 a new Liberal ministry was sworn in under the premiership of Hon. S. N. Parent—a comparatively young man who had been Commissioner of Lands, Forests, and Fisheries in Mr. Marchand's ministry and Mayor of Quebec city several years. Mr. Parent retained his old portfolio in the Government, and Mr. Shebyn resumed his office. The Hon. H. Archambault as Attorney-General, the Hon. F. G. M. Dechene as Commissioner of Agriculture, the Hon. G. W. Stephens as member without portfolio, the Hon. A. Turgeon as Commissioner of Colonization and Mines (with the addition of the provincial secretaryship), and the Hon. J. J. Guerin, member without portfolio, retained their posts. Mr. Lomer Gouin came in as Commissioner of Public Works in place of Mr. H. T. Duffy, who took the treasuryship, and the Hon. J. E. Robidoux retired and was appointed to a provincial judgeship.

Finances.—On Jan. 25, 1900, Mr. Marchand presented his annual budget as Provincial Treasurer. His estimated expenditure for the year ending June 30, 1901, was \$4,780,652, an increase of \$200,000 over the preceding year's estimates. He declared that on June 30, 1899, the total liabilities, including the funded debt and its increase by the conversion, the temporary loans, trust and railway deposits, outstanding warrants, increased railway subsidies, etc., amounted to a total of \$37,320,504, and the total assets to \$10,654,642, leaving on that date an excess of \$26,625,562 of liabilities. Compared with the previous year's statement, the increase of the excess of liabilities was \$795,038, while the increase of the capital of the funded debt conversion was \$915,280, so that actually there had been a decrease of \$120,241 in the excess of liabilities, apart from the increase by conversion of the debt.

On June 30, 1898, the funded debt outstanding amounted to \$34,238,841, and on June 30, 1899, to \$35,128,847, an increase of \$845,006 also due to the conversion. There was invested during the year for the sinking fund \$21,070, bringing that fund up to \$10,025,747 and leaving the net amount of the funded debt \$25,103,099. On June 30, 1899, the floating debt, made up of temporary loans, trust deposits, railway guarantee deposits, outstanding warrants, unearned railway subsidies, amounted to \$1,991,656, against which the Government held \$201,970 cash in banks and \$267,224 claims for loans and advances to individuals and corporations, leaving the balance of the floating debt at \$1,522,462, and constituting a decrease of \$18,897. The total amount of the debt converted was \$3,961,743, which added \$915,280 to the princi-

pal of the debt. In all, the total amount converted to that date was \$7,333,297, increasing by \$1,715,427 the principal of the debt. But the annual saving in the interest until the original bonds begin to mature amounted to \$34,202. Against this, however, must be put the commutation of the stamp duties on the \$9,048,725, amounting to \$56,653. The Treasurer further said that the contract executed between his predecessor and the Bank of Montreal for the conversion of the debt, which was entered into in April, 1897, expired on May 1, 1899. An arrangement was concluded, under authority of an order in Council of June 30, 1899, with the bank, to take charge of the conversion for the province at a commission of one half of one per cent. on the nominal value of bonds converted, the province to pay all expenses and brokerages, which would probably be about three eighths of one per cent. The price for the 3-per-cent. inscribed stock was advanced from 90 to 95 per cent., but owing to the depression that had taken place in the money market there had been no transactions so far, and the Government would wait more favorable opportunities to authorize any further conversion. On March 15 the following Opposition motion was presented to the house, but was defeated by 36 to 18 votes:

"That this house, while ready to vote the supplies to her Majesty, regrets to see that the party now in power has altogether failed to keep the solemn engagements made by it when in opposition, especially as regards the ordinary expenses of carrying on the Government. In fact, according to page 212 of the journals of the house, Hon. Mr. Dechene, now Commissioner of Agriculture, in 1896 laid before the house a proposition regretting that the expenses of Government, under Conservative administration from 1893 to 1896 inclusive, were as follow: 1893, \$3,925,258.75; 1894, \$3,876,990.33; 1895, \$4,043,228.43; 1896, \$4,041,221.66, making an average of \$3,973,424.91; and yet, according to public account for the fiscal year ending June 30, 1899, the ordinary expenses under the present Government were \$4,201,023, an increase of \$159,801.55 over 1896, and of \$222,598.30 over the average above given for the four years of Conservative Government from 1893 to 1896 inclusive."

The actual receipts of the province for the year ending June 30, 1900, were \$4,530,736, and included \$1,278,991 from Dominion subsidy; \$1,299,771 from lands, forests, and fisheries; \$247,793 from law stamps, legal fees, etc.; \$580,139 from liquor licenses; \$186,598 from taxes on commercial corporations; \$270,865 from succession duties; \$79,713 from insane institutions; \$300,084 from the Quebec and Ontario Railway. The total actual expenditure was \$4,626,472, showing a small deficit and including such items as expenses of public debt, \$1,538,059; legislation, \$199,563; civil government, \$285,872; administration of justice, \$526,107; education, \$438,758; public works and buildings, \$97,209; agriculture, \$193,759; lands, forests, and fisheries, \$149,704; colonization and mines, \$184,845; lunatic asylums, \$340,400; railway subsidies, \$90,276.

Education.—One of the questions of the year was the cutting off of certain Government grants to the universities and their application to elementary education. Early in February Dr. R. W. Heneker, Chancellor of the University of Bishop's College, Lennoxville, resigned the chairmanship of the Protestant Committee of the Council of Public Instruction. In explaining his reasons he referred to the marriage-license fees of Protestants in the province, which for thirty years had been allowed to go toward the support of the two universities—

McGill and Bishop's College—as a sort of Government grant, and spoke of the strong protests of the committee as well as of the universities against the legislation in question. Speaking of his retirement, he said: "I have been led to take this course for many reasons, but mainly because I find myself in direct antagonism with the sentiment now prevailing in the Legislature and now upheld by the Government (which represents the people), that no further grants should be made to the universities of McGill and Bishop's College. These, the leading educational institutional for the training of the Protestant youth of the province, must henceforth carry on their high-class work without any assistance from the public purse. All who are acquainted with university work know that the arts course is the foundation course of all learning, and can not without difficulty be maintained with satisfactory results without state aid, and it is in these institutions that the statesman, the professional man, the high-class merchant, and the teacher of high class get a proper preparation for the duties of life."

The Rev. Dr. W. J. Shaw was elected chairman in Dr. Heneker's place, and a motion of censure upon the Government for its policy in this connection was shortly afterward put to the committee and lost.

The provincial branch of the Dominion Prohibition Alliance, on March 1, declared that: "From information given, we are of opinion that the provisions in our school laws and regulations are entirely inadequate to give any effective and scientific temperance instruction in our elementary and high schools. We have reason to believe that it is now entirely ignored in a large proportion of our schools, and very inadequately taught in many of the others."

In the House of Assembly, on March 26, on a motion of Hon. E. J. Flynn and Mr. A. W. Atwater, the following resolution regarding the Government's attitude toward education was presented, but of course was defeated by the party vote:

"That this house finds that in spite of all the self-praises of the Government as regards education, the acts accomplished and for which they take credit were thus accomplished only for the greater part at least in virtue of an act passed under the previous administration, to wit: 60 Victoria, chapter 3, respecting 'elementary schools,' which appropriated the sum of \$30,000 to be applied, under the direction of the Lieutenant Governor in Council, by the Superintendent of Public Instruction in promoting elementary instruction in poor municipalities, aiding schools for benefit of the working classes in cities and towns, improving the condition of elementary and model schools' teachers, supplying schoolbooks gratuitously, and generally providing for the more efficient diffusion of elementary education throughout the province; the whole to such extent as the Lieutenant Governor in Council may be pleased to order, and under such regulations as he may be pleased to make. And even as regards the application made by the Government of the above statute, this house sees with regret that no general rule or regular system of distribution and payment has been followed; in fact, frequently the Government have applied portions of the above grant to purposes which should have been foreseen and specially provided for in the budget or else met by other appropriations. This house also regrets that during the last fiscal year 1898-'99 the Government applied and expended only \$22,729 out of the said \$50,000, thereby depriving elementary schools of the aid to which they were entitled, and particu-

larly poor school-teachers of the bonuses or gratifications which the law authorizes, and which they had the right to expect for the said year, to the amount of \$14,000."

Mr. Marchand, in his budget speech, defended the Government, pointing out that the withdrawal of the marriage-license fees from the universities helped the poor municipalities and weak elementary schools, and that his Government had been unjustly accused of practicing an undue economy by depriving public instruction of its legitimate share of the expenditure. He declared that if the amounts of the special grants of certain educational institutions and to night schools, entered under other headings, were taken into account with the ordinary expenditure for public instruction, it would be found that the present Government had laid out last year upon the cause of education \$412,657, as compared with \$389,759, the amount expended by the Conservatives on it in 1895-'96, the last full year of their *régime*. Not only had the ordinary appropriations for elementary schools, for superior education, and for literary, scientific, and industrial institutions been fully employed, but this present Government had added considerably thereto for the purposes just indicated. In addition, they founded at Montreal a normal school for female teachers, which was actually in full operation. They had also made provision for the free distribution of a geographical map of the province to all the public schools. This map was ready, and its distribution would be effected as soon as it had been approved by the Council of Public Instruction. They were, moreover, preparing to distribute a free series of elementary-school text-books to primary schools.

The Roman Catholic elementary schools in the province, on June 30, 1899, included 4,203 under control of municipalities and 53 independent. The model schools were 347 under municipal control and 140 independent. The academies under the former head numbered 35, and under the latter 96. The independent Catholic normal schools, classical colleges, universities, etc., numbered 26. Of the Protestant schools, 885 of an elementary nature were under municipal control, together with 52

model schools and 29 academies. There were 7 universities, colleges, and normal schools. The Catholic pupils in Roman Catholic schools of all kinds numbered 276,988; the Protestant pupils in Protestant schools numbered 36,808. There were 1,040 students at Laval and 1,320 at McGill and Bishop's College. The expenditure by municipalities upon education in 1899 was \$1,448,695.

Railways and Bridges.—The mileage of railway track in the province in 1899 was 3,345 miles. A new railway was subsidized for colonization purposes, between Labelle and Lake Nomingui, with \$5,000 a year for twelve years. The South Shore Railway Company was granted \$8,900 annually for ten years, to build bridges over St. Francis and Yamaska rivers. The great event of the year, however, was the large Dominion grant of \$1,000,000, and a promise of another million, to the proposed bridge over the St. Lawrence, near Quebec. The provincial subsidy was \$250,000, and a grant of \$300,000 came from the city of Quebec.

Mines.—The iron ore produced by the province in 1898 amounted to 17,873 tons. The gold production was only \$4,916 in value in 1899. The silver production was \$43,655. The phosphate was valued at \$9,200.

Colonization.—The amount spent in 1899 for colonization, including grants to colonization societies, was \$79,000. Much of this was spent on 527 miles of road and 13,047 feet of bridge work. Half of the total amount of grants went to the Metapedia, Lake St. John, and Ottawa districts alone. All bridges are constructed under the immediate supervision of the Department of Mines and Colonization. Its annual report for 1899 recommended that lands for settlement be sold only where they would be easy of access, in order to group colonies together as far as possible, and to enable the department to see readily who were *bona fide* settlers. About 278,105 acres of land were surveyed, at a cost of \$36,037. The expenditure of the department for 1898-'99 amounted to \$140,493. The Quebec office handled 3,146 immigrants and the Montreal office 2,550, the great majority of them being English, Scotch, and Irish. The number of repatriated French Canadians was 5,561 for the year.

R

REFORMED CHURCHES. Reformed Church in America.—The Committee on the State of the Church reported to the General Synod of this Church in June the following numbers for the denomination: Of churches, 643; of ministers, 715; of families, 60,716; of communicants, 109,899; of admissions during the year on confession, 4,696; of Sunday schools, 925, with 124,248 enrolled members, 25,061 of whom were under systematic catechetical instruction; of Christian Endeavor Societies, 475 senior, 200 junior; and between 40 and 50 Societies of the Brotherhood of Andrew and Philip. Amount of contributions for benevolent purposes, \$354,343, or \$38,061 more than in 1899; for congregational purposes, \$1,900,000. The Sunday schools had contributed \$21,817, and the Christian Endeavor Societies \$9,198 to foreign and domestic missions and education. Twenty-two hundred and sixty-one persons had been received into the communion of the Church from the Sunday schools. The apparent whole number of communicants had been reduced 1,766 through a revision of the rolls in accordance with a recommendation of the previous General Synod.

The Committee on Domestic Missions reported that it had closed its year free from debt, with a balance of several hundred dollars in its treasury. Of the 650 churches, 227 were aided by the committee.

The Board of Education reported itself for the first time in half a century out of debt.

The Committee on the Disabled Ministers' fund returned a slight increase of contributions from the churches, but no increase of income from invested funds. Of its 46 beneficiaries, 34 were women. A proposition from the mayor and citizens of Pekin, Ill., for the establishment of a ministers' home of the Reformed Church in connection with a hospital contemplated in that city was referred by the General Synod to the Board of Direction.

The present total capital of the Widows' fund was returned at \$107,828, showing an increase for the year of \$1,044. The year's receipts had been \$11,782, and the payments \$10,189. The full amount of \$200 had been paid to annuitants.

The year's contributions for the Theological Seminary at New Brunswick, N. J., had been \$4,005 for current expenses, and \$27,036 for en-

dowment. Since the institution of the special Committee on Finances of this institution, in 1897, \$7,439 had been received for current expenses, and \$28,351 for endowment. A single gift of \$25,000 had been made by Mr. Ralph Voorhees.

The receipts of the Board of Foreign Missions for the year ending April 30, 1900, were \$108,000 for the regular work, and, including special gifts, \$136,576 in all, besides \$10,637 contributed for the Arabian mission; making a total of \$147,213.

The receipts of the Woman's Board were, further, \$50,683.

The General Synod met at Asbury Park, N. J., June 6. The Rev. Edward P. Johnson, D. D., of Albany, N. Y., was chosen moderator. The Committee on the State of the Church presented statistics of the growth of the Church during the past fifty years, showing that the number of particular synods had increased from 2 in 1850 to 4 in 1900; the number of classes, from 24 to 35; of churches, from 292 to 643; of ministers, from 293 to 715; of communicants, from 33,553 to 109,899; of Sunday-school scholars, from 19,791 to 124,248; and the amount of offerings for foreign missions, from \$9,606 to \$155,943, and of those for domestic missions from \$5,095 to \$90,054—the statement revealing that in fifty years the number of churches and ministers had more than doubled; the number of communicants had multiplied more than threefold, and of Sunday-school scholars more than sixfold; and the offerings for foreign and domestic missions were more than sixteen times as large as in 1850. The number of persons received on confession in 1850, 1,325, represented an average of about 4½ to each church; the number in 1894, 6,114, an average of about 10. But the number received on confession during the past year was less than for any one of the ten preceding years, while within the past six years, with one exception, the number had decreased from 6,114 in 1894 to 4,695 in 1900. A similar tendency to slackening of increase in membership was observable in other denominations. The Synod, in view of the approaching beginning of the twentieth century, resolved to observe the first week in January, 1901, as a special season of thanksgiving and prayer, and especially to celebrate the new era by the collection of offerings, \$250,000 being the amount desired, for the endowment and proper equipment of the Theological Seminary, at New Brunswick, N. J. A special committee was appointed to consider the system of instruction in the Sunday schools and propose methods for making it more efficient in training the minds and hearts of children and youth. Other special committees were appointed to revise the forms or prepare new forms for ordination and installation of ministers and of elders and deacons; to revise the baptismal forms; and to devise some plan of oversight and regulation for bringing vacant churches and unemployed ministers and candidates together. In order to meet the increasing demands on ministerial service, and to furnish enlarging opportunities for preparation among the graduates of the theological seminaries, the larger churches were recommended to employ younger ministers, wherever it was practicable, as assistants to the regular pastors. The classes were requested to appoint each a permanent committee on educational institutions. Steps were directed for securing a full endowment for the Western Theological Seminary. One two-year post-graduate course was instituted for each of the seminaries, and a number of other measures were advised for the extension and improvement of ministerial education. The support of individual missionaries or

of particular fields by single churches or groups of churches and by individuals having means was commended. In order to extend the usefulness of the particular synods, the giving of them more the character of a conference embodying a representation of all general church activities, was advised, to which end arrangements were suggested for holding in connection with the regular work of the synod public meetings in behalf of the enterprises of the Church. The report on the Sabbath declared any and all secularization of the Lord's Day destructive of its beneficent design and inimical to public and private morality. A resolution of sympathy with the Reformed Churches of South Africa was passed.

This resolution, having been transmitted to the envoys of the South African republics to the United States, P. Louter Wessels, replying for them, said: "The Dutch Reformed is a very strong Church in our country. The majority of the Boers are members of that Church, although they are granted absolute facilities and freedom to join any other denomination. The Dutch Reformed Church has its houses of worship established in every city and village in South Africa, and its pastors are well paid and their services well attended. Several theological institutions are established, where the ministers have to spend several years in preparation for the ministry. The influence of our Church educational and missionary work is advanced on every hand."

REFORMED EPISCOPAL CHURCH. The Committee on the State of the Church reported to the General Council of this body in May, 1900, that the number of communicants was 10,000, and that of members of Sunday schools 19,782. A distinct gain in three years was shown. The churches had raised for all purposes \$165,811, and held property having an aggregate value of \$1,573,556. Seating capacity was provided in the church buildings for nearly 20,000 persons.

The sixteenth triennial General Council met in Baltimore, Md., May 16. Bishop James A. Latané, D. D., was chosen presiding bishop. The treasurer reported that his receipts had been \$17,091, and that no liabilities existed, while a balance of \$3,943 remained on deposit. The sum of \$40,718 had been received for the Theological Seminary, and its accounts showed a balance in bank of \$2,420. A resolution was unanimously passed urging the clergy to present to their parishes the subjects of a better support of the seminary, and of inducing a larger number of young men to enter the ministry. The treasurer of the special Church Extension Trust reported that \$21,884 had been received for it, and a balance of \$1,364 stood to its credit. The Council voted, in accordance with the wishes of the creator and donor of this trust, to dissolve and reorganize it. The Board of Foreign Missions had received \$14,971. The Publication Society returned \$5,000 worth of stock, with business done during the year to the amount of \$7,011. The sessions of the Council were largely devoted to the consideration of questions relating to the constitution and canons. A proposition to insert a clause requiring from all candidates for the ministry a pledge of abstinence from the use of alcoholic liquors and tobacco was withdrawn, after a debate which revealed a considerable difference of opinion among the members of the Council.

RHODE ISLAND, a New England State, one of the original thirteen, ratified the Constitution May 29, 1790; area, 1,250 square miles. The population, according to each decennial census, was 68,825 in 1790; 69,122 in 1800; 76,931 in 1810;

83,015 in 1820; 97,199 in 1830; 108,830 in 1840; 147,545 in 1850; 174,620 in 1860; 217,353 in 1870; 276,531 in 1880; 345,506 in 1890; and 428,556 in 1900. Capitals, Providence and Newport; after 1900, Providence only.

Government.—The following were the State officers in 1900: Governor, Elisha Dyer, succeeded May 29 by William Gregory; Lieutenant Governor, William Gregory, succeeded by Charles D. Kimball; Secretary of State, Charles P. Bennett; Treasurer, Walter A. Read; Attorney-General, Willard B. Tanner; Auditor and Insurance Commissioner, Charles C. Gray; Superintendent of Education, Thomas B. Stockwell; Adjutant General, Frederick M. Sackett; Railroad Commissioner, E. L. Freeman; Commissioner of Industrial Statistics, Henry E. Tiepke; Record Commissioner, R. Hammett Tilley; Factory Inspectors, J. Ellery Hudson, Helen M. Jenks; Surgeon General, George H. Kenyon; Inspector of Beef and Pork, James R. Chace; Inspector of Lime, Herbert Harris; Commissioner of Sinking Funds, John W. Danielson, succeeded by Olney Arnold; Inspector of Cables, S. B. Hoxsie; Inspector of the Scythe Stones, W. H. Comstock, succeeding Benjamin Wilson; Chief Justice of the Supreme Court, Charles Matteson, who resigned after a continuous service of over twenty-five years, and was succeeded May 29 by John H. Stiness; Associate Justices, Pardon E. Tillinghast, George A. Wilbur, Horatio Rogers, W. W. Douglas, Edward C. Dubois, John T. Blodgett; Clerk, B. S. Blaisdell. All the State officers are Republicans.

The elections of State officers have been held annually in April, but by a recent change in the Constitution they will be held hereafter in November. Inauguration of officers will take place the first Tuesday in January. Annual sessions of the Legislature have been held at Newport beginning the last Tuesday in May, and annual adjourned sessions at Providence beginning in January. By the amendment to the Constitution, there will hereafter be but one annual session, at Providence, beginning the first Tuesday in January. The length of the session is not limited, but the pay of legislators ceased at the end of sixty days; it has been increased from \$1 to \$5 a day. The Legislature consists of 38 Senators and 72 representatives. The Constitution provides that a new apportionment may be made after a census has been taken by authority of the State or the United States.

Population.—The increase of population in the last decade was 83,050, or 24 per cent. In the decade next preceding the increase was 24.9 per cent. The population by counties is as follows:

COUNTIES.	1890.	1900.
Bristol	11,428	18,144
Kent	26,754	29,956
Newport	28,552	32,599
Providence	255,128	328,683
Washington	23,649	24,154

Among the towns and cities, Cranston shows the largest percentage of gain, 64.79. East Providence and North Providence each show a gain of 44.91 per cent., and Pawtucket 41.98. The census returns of the larger places are as follow: Providence, 175,597; Pawtucket, 39,231; Woonsocket, 28,204; Newport, 22,034; Warwick, 21,316; Central Falls, 18,167; Cranston, 13,343; East Providence, 12,138; Lincoln, 8,937; Cumberland, 8,925; Westerly, 7,541; Bristol, 6,901; Burrillville, 6,317; Coventry, 5,279; Warren, 5,108; South Kingstown, 4,972; Johnston, 4,305; North Kingstown, 4,194; Scituate, 3,361; North Providence, 3,016;

Tiverton, 2,977; East Greenwich, 2,775; Hopkinton, 2,602; North Smithfield, 2,422; Smithfield, 2,117; Portsmouth, 2,106.

Finances.—The balance in the treasury at the beginning of the year was \$52,557.28; the receipts during the year, \$1,481,479.75; total, \$1,534,037.03. Among the sources of receipt were: Tax assignments, \$296,693.58; State tax, \$347,424.79; institutions for savings, \$351,966.46; State insurance companies, \$73,719.28; foreign insurance companies, \$83,893.27; building and loan associations, \$401.21; town councils, \$116,257.76; State institutions in Cranston, \$50,323.78; State home and school, \$275.86; school fund dividend, \$8,710.98; charters, \$14,140; civil commissions, \$2,392; peddlers' licenses, \$2,485; auctioneers, \$1,900.50; Commissioners of Shell Fisheries, \$20,973.08; commercial fertilizers, \$2,658; interest on deposits of the revenue, \$2,638.30; National Home for Disabled Volunteer Soldiers, \$12,179.81; Supreme Court, \$22,653.46; tax on street railway companies, \$24,485.80; on telephone companies, \$4,259.29; on telegraph companies, \$881.79; on express companies, \$449.80.

The disbursements for the year amounted to \$1,355,447.95. Among the items are: Salaries, \$137,499.22; expenses of General Assembly, exclusive of clerks and committees, \$17,159.46; support of the State institutions in Cranston, \$300,323.78; interest on Statehouse construction bonds, \$76,500; interest on money borrowed, war with Spain, \$5,800; militia and military affairs, \$37,500; readjusting ward lines, city of Providence, \$4,569.31.

The military and naval expenses occasioned by the State's connection with the late war with Spain appear to be kept as a separate account. Under this head the total receipts, including the balance on hand at the beginning of the year and a check on account from the United States Treasury Department for \$32,601.46, were \$34,340.39. The payments include the cancellation of a note for \$10,000 and the payment of \$20,000 on another note, and amount in all to \$30,472.47, leaving a balance on this account of \$3,867.92. The notes outstanding amount to \$180,000. The War Auditor held \$44,776.80 of the State's claim for additional evidence, and recommended that \$37,300.41 be rejected as being for charges not deemed proper by the department.

The balance in the treasury at the close of the year was \$178,589.08.

The bonded debt of the State amounts to \$2,300,000.

Education.—The Legislature appropriated \$140,000 for the support of public schools, \$57,500 for the normal school, \$800 for institutes and lectures, \$6,000 for evening schools, \$3,500 for the School of Design, \$4,000 for purchase of school apparatus, \$14,000 for education of blind and imbecile children, \$136,700 for the Institute for the Deaf, \$15,000 for the College of Agriculture and Mechanic Arts, and \$7,000 for free public libraries.

WILLIAM GREGORY,
GOVERNOR OF RHODE ISLAND.

Eight towns took advantage of the new law for granting State aid to high schools. The Normal School graduated a class of 52 in June.

The endowment fund for Brown University had reached \$1,031,100 at the time of commencement. In addition, a bequest of \$45,000 had been made by Mr. Van Wickle for a gateway and administration building, and Mrs. H. N. Slater had given her residence for a home for students of Pembroke; it will accommodate 20 students. The whole number of students in 1899-1900, including graduates and special students, and those of Pembroke College, was 870. The number of graduates after the last commencement was 5,267, of whom 172 were women.

Fifty free public libraries are receiving aid from the State.

The report of the trustees of the School for the Deaf shows: Number of pupils, 68; number of boys, 39; number of girls, 29; present attendance, 66.

Militia.—The annual return of the organized Naval Militia shows 15 officers, 32 petty officers, and 157 enlisted men, a total of 204. The annual return of the organized militia shows 156 officers, 287 noncommissioned officers, 47 musicians, 836 privates, a total enlisted force of 909, with an aggregate of 1,356. This was divided as follows: Brigade and general staff, 19; cavalry, 111; chartered companies, 342; batteries, 57; infantry, 740; signal corps, 5; hospital corps, 41; machine gun battery, 41.

The appropriations for the militia during the year amounted to \$51,500.

The encampment at Quonset was attended by about 84 per cent. of the brigade, the largest attendance in recent years. The Naval War College opened at Newport, June 4.

Charities and Corrections.—Of the State institutions at Cranston, the Governor said in his message: "The most important step taken by the Board of State Charities and Corrections in the year now closed is the signing of the contract for the construction of the dining hall and service building at the State Hospital for the Insane, work on which has begun. The need of additional accommodations at the State Prison and Providence County jail has been referred to in the annual reports of the board for a number of years, and it is as serious now as before. On Nov. 1 there were 189 State prisoners, 65 of whom had to be placed in the jail wing, leaving but 59 cells and the temporary building to accommodate 245 men, 114 men having to be placed in the 59 cells. The total capacity of the 5 homes, or cottages, at the Sockanosset School for Boys is 250 beds, 50 in each home. On Nov. 1 the number of boys at the school, 354, exceeded the capacity of the homes by 104. The superintendent of the Oaklawn School for Girls reports the same overcrowded condition as that of the Sockanosset School. There are now 42 girls at the school, with about 20 outside, in families. The building has accommodations for about 30, or possibly 35, although it holds all who are now there."

The annual report of the Board of Soldiers' Relief shows that the membership of the home, Dec. 31, 1899, was 186, and that there was a net gain of 8 members during the year. Since the opening of the home 490 have been admitted. The average age of the members of the home was sixty, on Dec. 31, and the average number present during the year 1899 was 156. The average cost of maintenance per capita was \$247.69. There were 137 pensioners in the institution at the end of the year, and the total amount of pension money received during the year was \$13,436.80.

The State Society for the Prevention of Cruelty to Children reported having investigated 360 new cases, involving 631 children. It investigated 100 more cases than in 1899, and bettered the condition of 185 more children.

Banks.—Thirty-five savings banks and institutions for savings, of which 6 are in process of liquidation, filed reports for 1900. The following items furnish data as to these institutions: Number of institutions for savings, 35; amount of deposits, \$74,846,759.30; number of depositors, 148,695; number depositing \$500 and under \$1,000, 19,600; number depositing \$1,000 and upward, 23,400; number depositing under \$500, 105,695; average rate per cent. of annual dividend for 1900, 3.93; amount of reserved profits, \$2,395,934.31; increase of deposits from previous years, \$1,660,135.29; increase of depositors, 2,874; average deposits to each depositor, \$503.36.

Several banks were consolidated in 1900 with the Industrial Trust Company. Eleven trust companies filed statements this year, 3 more than last year. The aggregate capital of these companies amounts to \$4,107,634, against \$2,808,829 in 1899—an increase of \$1,298,804. A large portion of this increase—viz., \$1,100,000—represents the capital stock of the three newly organized companies. They report deposits in participation account to the amount of \$16,852.88, and in general account \$23,295,551.65.

Railroads.—From the commissioner's report it appears that the capital stock of the steam roads owned and operated in this State is \$105,582,475; total indebtedness, \$71,855,919.04; total receipts, \$43,858,651.32; net earnings, \$6,614,602.44; miles of road in this State, 209+; miles single track, 435.

The capital stock of the electric roads is \$16,582,000; total indebtedness, \$4,410,054.70; total receipts, \$2,609,572.26; expenditures, \$1,644,029.26; net earnings, \$965,543; miles of road in this State, 208+; miles single track, 248.

Products and Industries.—The report of the factory inspectors for 1900 says: "We have inspected 595 establishments during the year 1900. This is an increase of 46 over the number visited in 1899. The new establishments are pretty evenly distributed among the varied industries of the State. The number employed in the various establishments coming under the law was found to be as follows: Males of sixteen years of age and over, 44,337; females of sixteen years of age and over, 32,215; whole number of adults, 76,552. Males under sixteen years of age, 2,844; females under sixteen years of age, 2,409; whole number of children, 5,253. Total number employed, 81,805. A comparison of the foregoing figures with those reported last year shows an increase of 2,502 in the number of men employed, an increase of 1,754 in the number of women employed, an increase of 289 in the number of boys employed, and an increase of 298 in the number of girls employed, a total increase of 4,843."

There have been strikes during the year at the Lonsdale mill, and at Warren, Westerly, and Pawtucket, the most serious being at the Lorraine mills, in Pawtucket. This began about April 11. The cause, as stated by the weavers' committee, was that, while there was a general increase in wages throughout the country about six months before, there was none at the Lorraine mills. When the weavers applied for an increase, the treasurer offered advances on certain kinds of cloth, which amounted to about 1 per cent. of a general advance; but he proposed that the weavers take 4 looms instead of 3, which would give \$12.60 a week instead of \$10.80, pro-

vided a man could run the 4 and turn off the specified amount of cloth; but this they said they could not do.

The oyster industry has shown great prosperity in the past three years. There are 3,226 of the State acres leased; 1,892 return to the State \$10 an acre, and 1,338 \$5 an acre. With land yet to be leased the income to the State for the current year from this source is estimated at nearly \$30,000.

It is reported that valuable mineral deposits have been discovered at Foster. One sample tested \$250 to the ton, containing gold, silver, nickel, and copper. The average assay tests show from \$25 to \$70 a ton.

The number of business failures in the State in 1900 was 83, with liabilities amounting to \$722,868; while in 1899 there were 98 with liabilities of \$1,817,747.

The New Statehouse.—The new Capitol, at Providence, in which all the legislative sessions are hereafter to be held, was ready for occupancy Jan. 1, 1901. It is a fine and costly marble structure, with a dome and rich interior work of marbles and carvings, and wall decorations in color. The frieze around the dome bears the quotation from Tacitus: "Rara temporum felicitas ubi sentire quæ velis et dicere quæ sentias licet." (O rare felicity of the times when it is permitted to think what you wish, and to say what you think.)

In early colonial days in Rhode Island the General Assembly, or what corresponded to the present body of that title, met in the four towns—Newport, Portsmouth, Providence, and Warwick. Newport was made, by the terms of the royal charter, the principal seat of government in 1663. But the Assembly still met in the four towns. Portsmouth was finally omitted from the circuit on account of its proximity to Newport, and in the early part of the eighteenth century South Kingstown was added to the list of meeting places. Later, East Greenwich became an occasional meeting place, while Warwick was dropped. The Constitution of 1842 made Newport, Providence, Bristol, East Greenwich, and South Kingstown the meeting places of the General Assembly, but twelve years later an amendment provided for the holding of an annual session at Newport and an adjournment to Providence. The Legislature has met at Newport in May, and after a brief sitting has adjourned to meet in Providence in January. The session at Providence has been more extended than that at Newport, and the State offices have been there.

Providence.—The city celebrated this year the centennial of the establishment of its free public schools. A bequest of about \$200,000 has been made to the city by Anna H. Man, providing a trust fund for Roger Williams Park. She left \$10,000 to the Society for the Prevention of Cruelty to Animals. Charles H. Smith left the income of about \$200,000 of property to be used for increasing the botanical collections at the park.

The bank clearings for 1900 amounted to \$326,299,700, which is nearly \$9,000,000 less than those of 1899. The number of building permits issued was 1,122, against 1,268 the year preceding. A new public library building was opened in March.

Newport.—The new city hall was formally turned over to the city in October.

Pawtucket.—A bequest of \$40,000 has been left to Pawtucket institutions by Moses Pierce, of Norwich, Conn. Pawtucket's debt amounts to more than 10 per cent. of its total valuation.

Watch Hill.—The assessors' books at West-erly show that the assessed valuation of prop-

erty at Watch Hill in that town is approximately \$1,000,000. Within the last five years the cottage settlement has steadily increased, until now there are probably 60 villas.

Political.—The State election took place April 4. The Republican convention, at Providence, March 13, made the following nominations: For Governor, William Gregory; Lieutenant Governor, Charles Dean Kimball; Attorney-General, Willard B. Tanner; Secretary of State, Charles P. Bennett; General Treasurer, Walter A. Read.

The resolutions, after praising the national administration and the acts of Congress, approved the State administration and the action of the General Assembly in proposing to alter the Constitution by specific amendments, and said further: "The insincerity of the State Democracy appears in its denunciation of monopolies and trusts, while leading members of its own organization are actively engaged in their promotion, both within and without the State; in its denunciation of imperialism and centralization of power while selecting as its nominee for Governor a Federal official in plain defiance of the provisions of the Constitution that no person holding an office of trust or profit under the United States shall act as Governor or other general officer; in its boastful pretense of favoring the purity of the ballot while so fraudulently stuffing the ballot boxes in the Fifth Ward of Pawtucket at its last caucus as to cause the Democratic chairman of the Board of Canvassers of that city, upon an appeal taken by a Democrat under a Republican caucus act, to decide his own party caucus was fraudulent and void; and in assuming to be the special friend of the workingman while seeking the defeat of William Gregory, who as boy and man has been a mill operative and wage-earner."

The Democratic Convention met March 15, and named the following candidates: For Governor, Nathan W. Littlefield; Lieutenant Governor, Joseph H. Boucher; Secretary of State, Clark Potter; Treasurer, Fayette Bartlett; Attorney-General, Dennis J. Holland.

After criticising the colonial policy of the administration, denouncing trusts, and reaffirming the principles of the party, the resolutions said: "In the words of the Father of his Country we declare that 'the basis of our political systems is the right of the people to make and alter their constitutions of government!' This, the first and most important provision of our State Constitution, is now held to be null and void by a Republican machine, which refuses to take one step toward its restoration. A constitutional convention should be held at the earliest day possible. Among the changes needed in the organic law of the State, the two following are the most urgent: First, the establishment of a just representation of the people in both branches of the General Assembly.

"Second, the giving to the 30,000 registry voters residing in our five cities the right, which justly belongs to them as bearers of all the burdens of citizenship, to vote for members of city councils, constituting, as those bodies do, by far the most important part of municipal government.

"We demand protection for the public and for street railway employees by a ten-hour law, and also that vestibules be placed upon all new cars.

"We call the attention of the voters of the State to the now established habit of the Republican majority in the General Assembly of postponing all important business until after their successors have been elected."

Nominations were made by the Prohibition and Socialist-Labor parties.

The Republican candidates were elected. The vote for Governor stood: Gregory (Republican), 28,043; Littlefield (Democrat), 17,184; Reed (Socialist-Labor), 2,858; Metcalf (Prohibitionist), 1,848.

On joint ballot the Republicans have 96 votes in the Legislature, to 14 of the Democrats.

The amendment to the Constitution changing the time of election was carried by a vote of 24,351 to 11,959, and the proposition to issue bonds to finish the Statehouse was carried by 28,253 to 15,246.

At the November election the vote was: McKinley, 33,784; Bryan, 19,812; Woolley, 1,529; Malloney, 1,423.

Legislative Session.—The adjourned session at Providence opened Jan. 30 and closed May 4. The Newport session began May 29 and ended June 13. Frank E. Holden was Speaker of the House. The Governor presides over the Senate.

A constitutional amendment was passed and carried at the November election. It provides that the annual election of State officers shall be held in November instead of in April, and voters to be registered must be on the list before July 1. The method of procedure for filling vacancies was changed. The provision requiring votes for State officers to be sent sealed to the Secretary of State, and to be counted and declared by the Legislature in grand committee, was repealed. It is provided also that there shall be but one annual session of the Legislature, which is to be in Providence, beginning the first Tuesday in January, and members are to receive \$5 a day instead of \$1, as heretofore.

A voting-machine commission was created, and \$15,000 appropriated. It is to examine machines and report to the General Assembly. The Secretary of State is to buy the machines at a cost not exceeding \$250, and furnish them to cities and towns applying for them.

An appropriation of \$5,000 was made for an exhibit at the Pan-American Exposition; the Governor is to appoint five commissioners, who are to serve without compensation, and an executive superintendent with salary.

The game laws were amended. A penalty not to exceed \$500 was prescribed for the killing of a deer before Feb. 1, 1905, except in the case of a person killing a tame deer of his own. It was made unlawful to take or kill a rabbit, hare, or gray squirrel between Jan. 1 and Oct. 15. The open season for hunting birds was changed also. A fine of \$20 or imprisonment for thirty days or both was imposed for fishing otherwise than with a single hook and line, or taking fish from any private waters for breeding fish without the owner's consent, and a fine of \$15 for taking or having in possession black bass less than 8 inches long.

A law was passed to prevent importation of diseased cattle. A bounty of \$5 was offered for every wild fox killed.

A State commission of five members, to be appointed by the Governor, was created for constructing side paths and keeping them in order. The paths are to be 3 to 6 feet wide, and a license fee of 50 cents to \$1 is to be charged.

The extreme penalty for dealing in obscene literature was raised from one to two years' imprisonment, and the fine, formerly \$500, was placed at \$100 to \$1,000; and it was made unlawful to use an instrument uttering language or showing pictures tending to corrupt youth.

Other enactments were:

Prescribing a penalty for counterfeiting or imi-

tating trade-marks, labels, etc., which are to be filed with the Secretary of State.

Providing a penalty of \$20 for wearing a badge of Spanish War veterans without right.

Extending from six to twenty-four hours the time that persons arrested without warrant for cruelty to animals may be kept in custody.

Permitting manufacturing corporations to increase or reduce their capital stock only on a three-fourth vote of all the capital stock, all shares to have equal right to vote.

Permitting executors and administrators to provide for perpetual care of burial lots.

Requiring insurance companies to pay 2 per cent. tax on gross premiums and assessments on property and lives.

Making the salary of the Railroad Commissioner \$2,500 instead of \$1,000, and providing \$500 for salary of the deputy; requiring the railroad corporations to provide for the salary and expenses of the commissioner, not more than \$4,000.

Defining the legal weight of measures of certain commodities—apples, oats, coal, wheat, etc.—46 in all.

Providing for an issue of additional Statehouse bonds, not to exceed \$700,000, for finishing and furnishing the new Statehouse at Providence and laying out the grounds, to be voted upon in November.

An act creating a police commission for Newport was passed. The commission, which is to be appointed by the Governor, can appoint the chief of police, and has power to compel the production of books and papers, to punish for contempt, and is to have general control of the department. The question of the constitutionality of this act, so far as the power of appointment of the chief of police is concerned, was brought before the Supreme Court in August, and the Chief Justice decided that there was nothing contrary to the Constitution in that.

The law exempting manufacturing corporations from taxation for a certain number of years came before the court, and was upheld.

The act of 1899 prohibiting the use of trading-stamps was pronounced unconstitutional by the Supreme Court.

Appropriations were made, among which were: For expenses of the General Assembly, \$30,400; judicial expenses, \$134,500; education, \$238,300; for free public libraries, \$7,000; for the indigent insane, \$10,000; State printing and binding, \$42,000; military affairs, \$47,500; Board of Charities and Corrections, \$276,500; salaries, \$139,500; clerical assistance, \$11,200; interest on Statehouse bonds, \$76,500.

At the Newport session George P. Wetmore was elected United States Senator, to succeed himself. John H. Stiness was chosen Chief Justice, succeeding Charles Matteson, resigned, and John T. Blodgett was elected an Associate Justice.

ROMAN CATHOLIC CHURCH. General.—The closing year of the century, consecrated by the Pope to solemn homage to the Divine Redeemer, was notable chiefly for the pilgrimages which flocked to Rome during the entire twelve months of jubilee. It was formally inaugurated on Christmas eve of 1899 by the ceremony of opening the holy door, and closed again a year later by a celebration in which the *porta sancta* was sealed up by his Holiness in person, to remain closed until the dawn of the twenty-first century. But within the twelve months begun on Dec. 24, 1899, Rome welcomed an influx of visitors greater than in any year since it was the mistress of the world. No count was kept of the jubilee pilgrims, but even in the summer season

their number never fell below 10,000 a week, and in the months when the atmosphere was tolerable the total rose at times to 30,000 a day. The pilgrims came from all over the world, and few if any were disappointed by failing to obtain a sight of the Pope. When it is considered that his Holiness is ninety years of age, his receptions to the pilgrims, occasionally as many as six a week in the Sistine Chapel to the body of a pilgrimage, followed by a private audience to the leaders, can be considered as little less than miraculous.

Among the receptions extended by the Pope was one on April 7 to 75 sailors from the American training ship *Dixie*. His Holiness received them in the Sistine Chapel, and the sailors waved the American flag and greeted the Pontiff with what the official account described as "reiterati altissimi hurrah."

The special ceremonies of the jubilee year included the erection on 20 Italian mountains of monuments in memory of twenty centuries of Divine redemption; the blessing of the Agnus Dei; the closing of the holy door; and the universal celebration of midnight mass, by his Holiness's permission, on the eve of the new century.

The ceremony of blessing the Agnus Dei, which is peculiar to years of jubilee, was performed by his Holiness on June 17, assisted by a cardinal bishop, a cardinal priest, and the sacristan of the papal palace. These historic little pieces of wax were all decorated with allusions to the present holy year. The ceremony itself consisted of the immersion of the Agnus Dei into blessed water and the blessing of them with balsam and chrism. On the obverse of several of the Agnus Dei was a figure of the Divine Redeemer with the words, dictated by his Holiness: "Nil sit dulce magis quam corde quiescere Jesu—Leo XIII, P. M.," and on the reverse a figure of the Lamb of God with the words: "Ecce Agnus Dei qui tollit peccata mundi—Leo XIII, Pont. Max. Anno MDCCC, Pont. XXIII." On other of the Agnus Dei was a representation of the holy door with the words: "Haec porta Domini, Justi Intraunt in Eam—Leo XIII, P. M.," and on one side, "Anno Jubilei," and on the other, "Roma." On the reverse of these was a figure of the Lamb of God. The ceremony began at half-past five on Sunday afternoon with the blessing of the holy water by the papal sacristan, Mgr. Pifferi, O. S. A., Bishop of Porphyrium. His Holiness was not present at this part of the ceremony. The preparations made in the Hall of Consistory were tables covered with white cloths and bearing silver basins with water and silver scoops. The sacristan performed the blessing of the water according to the usual rite, assisted by the Augustinians of the papal sacristy. His Holiness was borne into the hall in *portantina*, accompanied by his court, an escort of the Noble Guard, and the Swiss and Palatine officers on duty, as well as by Cardinal Mocenni, Bishop of Sabina, and Cardinal Cretoni, priest of Santa Maria sopra Minerva. His Holiness put on the stole, recited some prayers at the throne, and descended to the tables, where he stood before the central basin, blessed the water a second time, and poured into it, using the form of a cross in pouring, balsam and chrism. He removed some of the water with the scoop into the two basins on either side, returned to his throne, and incensed the Agnus Dei, which filled three large coffers to the left of his throne. The Pontiff and the two cardinals next put on aprons of gauze, descended from the throne, and immersed the Agnus Dei in the three basins of consecrated water. The action of each was identical. The

Agnus Dei were handed to the celebrants by the Cistercian monks of Santa Croce in Gerusalemme and San Bernardo alle Terme and the ordinary pontifical chaplains; immersed by the Pope, the cardinal bishop, and the cardinal priest in the blessed water; removed by these with scoops, and delivered to the Cistercian monks, who took them to a large table at the side, and there dried them with towels.

The most important papal utterance of the jubilee year was the encyclical letter, *Jesus Christ Our Redeemer*, issued on Nov. 1, and directed to the Universal Church. It expressed most strongly the lifelong wish of his Holiness for the unification of Christendom. Its tenor may be learned from a characteristic paragraph:

"How is it that, in spite of all the zeal for the welfare of the masses, nations are in such straits and even distress, and that the evil is daily on the increase? We are told that society is quite able to help itself; that it can flourish without the assistance of Christianity, and attain its end by its own unaided efforts. Public administrators prefer a purely secular system of government. All traces of the religion of our forefathers are daily disappearing from political life and administration. What blindness! Once the idea of the authority of God as the judge of right and wrong is forgotten, law must necessarily lose its primary authority and justice must perish; and these are the two most powerful and most necessary bonds of society. Similarly, once the hope and expectation of eternal happiness is taken away, temporal goods will be greedily sought after. Every man will strive to secure the largest share for himself. Hence arise envy, jealousy, hatred. The consequences are conspiracy, anarchy, nihilism. There is neither peace abroad nor security at home. Public life is stained with crime."

Another important utterance of his Holiness was the address to the cardinals on the occasion of his ninetieth birthday, in which he gave the public the first intimation of his attitude on the South African War by a request that the cardinals would pray with him for the termination of the conflict and the agreement of both sides engaged. Others were a letter from his Holiness to Cardinal Respighi, Vicar of Rome, asking for prayers for the safety of the Christians in China, and an address to the American pilgrimage, in which he gave assurances of the affection in which he held this country, after which he touched and blessed the American flag.

Two saints were canonized in the course of the year, the greater of whom was Jean Baptiste de la Salle, the founder of the order of the Christian Brothers, and the first to put upon a practicable basis any plan for teaching the children of the poor. St. Rita de Cascia, of the order of St. Augustine, was canonized at the same time. An idea of the thoroughness of inquiry which precedes canonization may be gained from the fact that the cause of Jean Baptiste de la Salle had been before the Sacred College since 1839, and his beatification, which is the second step in the process of which canonization is the third, is thirteen years old. St. Rita de Cascia was beatified in 1627, her cause having then been before the Sacred College for two hundred and twenty-five years. Seventy-six martyrs who died in China in the beginning of the century were beatified about the time that their successors were being put to death by the Boxers. Others beatified were the venerable Dionysus of the Nativity and Redemptus of the Cross, Maria Maddalena de Barco, Antonio Grassi, Maria Crescentia Höss,

and Jeanne de Lestonnac. The last named was foundress of the Filles de Notre Dame. She was born a Calvinist, and received her instruction in the Catholic faith, curiously enough, from her uncle, Michel Eyquem de Montaigne.

Pope Leo's greatest undertaking in the material order was concluded in October by the consecration of the abbatial Church of St. Anselm, on the Aventine Hill. The building was not only designed and planned by his Holiness, but the funds to erect it were supplied by him. The ceremony of consecration was performed by Cardinal Rampolla, delegate of his Holiness *a latere*. More than 50 abbots of the Benedictine order were present from all parts of the world, for the new abbey is an international school. In accordance with a Benedictine custom, the consecrating prelates began the ceremony with a vigil which lasted all night.

The entrance of the Pope upon the ninetieth year of his age was celebrated by the presentation to the Pontiff of an address signed by more than 600 nonagenarians, and a dinner to 900 of the poor of Rome in the Belvedere courtyard of the Vatican.

A Congress of Christian Archaeology was held at Rome April 17 to 25. Among the most important of the subjects discussed was a motion for the rediscovery of the stairs leading to the crypt in which lie the remains of St. Peter, upon the theory advanced that the ancient entrance was utilized in the building of Constantine's basilica, and that under the tribune to the chapel of the confession would be found the door. It was determined to begin explorations at this point, in case the Pope's consent could be obtained.

Pursuant to a summons from the Holy See, the Friars Minor Capuchin, the Friars Minor Conventual, the Friars Minor, and the Third Order Regular met in Rome in September to the number of 10,000. These four orders comprise all the Third Order of St. Francis. The end of the congress was the social regeneration of the world, especially by means of the re-establishment of domestic life among the poor, the raising of wages, the equalization of taxation, and opposition alike to socialism and the tyranny of capital.

At a chapter general of Ursuline religious at Rome the different branches of the order were unified, a superior general elected, and constitutions for all houses of the order agreed upon. The initiative to this movement was given by the Pope, who has in the past few years unified many of the great religious orders.

An International Catholic Scientific Congress was held at Munich in September, and was attended by scientists and theologians of all religions to the number of about 1,000.

Five cardinals died in the year: Cardinal Trombetta, aged seventy-nine; Cardinal Jacobini, Vicar General of Rome, aged sixty-three; Cardinal di Canossa, aged ninety, the Dean of the Sacred College, and senior to his Holiness; Cardinal Mazella, aged sixty-seven; and Cardinal Haller, aged seventy-five.

The United States.—Early in the year the Pope approved the decision of the Propaganda forbidding the Christian Brothers to teach classics. This was the letter and spirit of the original rule, and the Sacred Congregation saw no alternative but to compel them to return to it. By the decision the teaching of classics by this order was permitted only to the end of the year.

Considerable agitation took place among Catholics as a result of the efforts of Bishop McFaul, of Trenton, to redress the grievances suffered by

his coreligionists in the United States. Organization was the means suggested by his lordship of giving strength to any Catholic plea for equal civil and political rights. In support of his thesis that members of the Roman Catholic Church have not a fair chance for political office, or even for the enjoyment of civil freedom and possession of property, he cited some important events of the year. Upon neither of the Philippine commissions was a Catholic appointed, although the great body of the Philippine people belonged to the Catholic faith, and one of the gravest questions to come before the commissions was that dealing with the status of the friars in the islands and the disposition of ecclesiastical property. His lordship further instanced the fact that while in 1901 the Catholics of the country numbered 12,000,000 out of a total of 70,000,000, or about one sixth, their representation in the House of Representatives consisted of 24 members out of 355, and in the Senate 2 out of 88. A confederation of Catholic societies under the direction of an advisory board was the plan outlined by Bishop McFaul. Although the scheme was met with considerable favor, little had been accomplished before the end of the year toward the organization proposed.

The need of better Catholic representation in high political circles was manifested by the failure of Congress to renew its appropriation for the Jesuit contract schools in its annual Indian appropriation bill. Senator Vest, of the Committee on Indian Schools, addressed the Senate in favor of the appropriation, giving it as his view that, apart from religious instruction whose dogmas he could not subscribe, the Jesuits were giving the Indians the only form of education which produced any results. Under their system the Indians received an industrial education, while in the Government schools only the usual elementary branches were taught. The percentage of attendance in the latter was 3 per cent. of the enrollment, and in the former 85 per cent. The appropriation was defeated.

The formal protest of the superioress of the Order of the Sacred Heart against the seizure of the convent of the order in Porto Rico by the military authorities was laid before President McKinley in April, was sent by him to the Porto Rican officials, and returned without action on their part. Meanwhile the convent, which was appropriated by the military authorities for use as a barracks during the war with Spain, was still so occupied at the close of 1900, the owners having been compelled to erect another building to take its place. The protest of the superioress of the order asked either the return of the building or some compensation for its seizure.

A similar protest was made in October by Archbishop Chappelle against the continued holding by the Government of the College of San José in Manila. The college was seized during Gen. Otis's administration, and the archbishop asked that the property be restored to the Church, to which he declared it belonged. The question as regarded this and other similar institutions was, whether the United States could succeed to the rights enjoyed by Spain as patron of ecclesiastical institutions under a contract which provided for royal support and endowment of the churches; in other words, whether the present government could claim the rights of a contract without assuming its burdens. The college by the will of its founder was put in charge of the Jesuits. When they were suppressed the Spanish throne claimed the right to succeed them as patrons under a grant from the papacy to interfere in church matters as a

return for support of ecclesiastical institutions. To this grant the United States could hardly fall heir because of its divorce of church and state. Since a number of institutions in Cuba and the Philippines are similarly situated, it is likely that the decision will ultimately be sought from the Supreme Court.

The edict of Gen. Wood prohibiting ecclesiastical marriages in Cuba was revoked on Aug. 13 by Gen. Brooke, and the church ceremony recognized as of the same validity as the civil contract. The edict had been issued in the preceding year, and its revocation was due to a petition signed by 30,000 Cuban citizens. By permission of the American authorities, the Dominicans established themselves in Cuba in May.

Important decisions of State and United States courts apparently affecting ecclesiastical rights were as follow during the year: That of the Supreme Court of Michigan (April 16), holding that the title to all church property was held by the bishop of the diocese in fee simple, and not merely as trustee for the congregations; that of the Supreme Court of Pennsylvania (April 23), holding that the united Greek Catholic congregations in America owed allegiance to the Roman Catholic Church and not to the Orthodox Greek Church; and that of the United States Circuit Court, New York (May 31), holding that statuary and sculpture imported by the order and for the use of a society established solely for religious and charitable purposes were free from duty.

The centennial of the founding of the Society of the Sacred Heart was celebrated at every convent of the order, Nov. 21-23. The semicentennial or golden jubilee of the diocese of Savannah was celebrated Oct. 28, and the new cathedral dedicated by Archbishop Martinelli, papal delegate. The Cathedral of St. Patrick, Newark, N. J., celebrated its golden jubilee March 17.

Trinity College, in Washington, D. C., for the higher education of women, was solemnly dedicated, Nov. 22, by Cardinal Gibbons. The college was formally placed in charge of the Sisters of Notre Dame.

The work of Most Rev. Archbishop Keane toward securing funds for the Catholic University at Washington resulted in gifts to the institution of more than \$500,000 in the year. Endowments for six chairs were also received.

Rev. Dr. McGlynn, who was removed from his charge of St. Stephen's Church, in New York city, in the eighties because of his strong advocacy of the principles of Henry George; excommunicated for disobeying a summons to Rome, and later pardoned and restored to his offices, died in Newburg, N. Y., Jan. 7. Right Rev. Joseph Rademacher, Bishop of Fort Wayne, Ind., died on Jan. 12. Other losses by death in the American hierarchy were those of Most Rev. John Hennessy, Archbishop of Dubuque, Iowa; Right Rev. Tobias Mullen, D. D., formerly Bishop of Erie, Pa.; and Right Rev. James A. Healy, D. D., Bishop of Portland, Me. (For sketches of all these, see OBITUARIES, AMERICAN, in this volume.)

Episcopal appointments were as follow: Right Rev. B. J. Keiley, Savannah, Ga.; Right Rev. Henry Moeller, Columbus, Ohio; Right Rev. Denis O'Donoghue, Auxiliary of Indianapolis, Ind.; Right Rev. Henry Ganjon, Tucson, Ariz.; Right Rev. P. J. O'Reilly, Auxiliary of Peoria, Ill.; Most Rev. John J. Keane, Archbishop of Dubuque, Iowa; and Right Rev. Herman Alerding, Fort Wayne, Ind.

The number of Catholics in the United States was reckoned at 10,129,677, an increase of 222,265 upon the preceding year. They were ministered

to by 8,660 secular and 2,976 regular clergy in 6,409 churches, 3,930 missions, and 1,723 chapels. There were 3,811 parochial primary schools, with 854,523 children; 30 episcopal seminaries, with 2,630 students, and 79 seminaries of religious orders, with 1,998 students.

Canada.—The question of the Manitoba schools which had been a grievance of the Catholics of the province for ten years was raised again during the visit of Mgr. Falconio, apostolic delegate to Canada, to Winnipeg in October. While sympathizing with the Catholics of the province under their triple burden—for the existing law not only requires them to support the public schools as well as their own schools, but to pay taxes on their own school buildings besides—his Excellency recommended a course of patience and mildness until full justice was obtained.

The Right Rev. Bertrand Orth was appointed Bishop of Vancouver Island, Feb. 26.

England.—Dr. St. George Mirvart, whose articles in two English periodicals for January aroused a storm of protest from English-speaking Catholics, was formally inhibited by Cardinal Vaughan, on Jan. 24, from approaching the sacraments. The objectionable articles contained statements denying or attempting to explain dogmas of the Catholic religion regarding the virginal birth of Christ, the perpetual virginity of the mother of God, original sin, the resurrection, the redemption, the everlasting punishment of the wicked, the inspiration of Scripture, and the authority of the Church. A formula containing a profession of faith and a retraction of his heresies was thrice presented to the aged and infirm scientist—he had been in the last stages of diabetes for more than a year—but he refused to sign. His death, April 1, at the age of seventy-three, furnished a substantial reason for the belief of his friends that his published opinions during the last year of his life were the result of mental aberration.

The agitation for a sufficient number of Roman Catholic chaplains in the navy to minister to the Roman Catholic sailors, discussion of which began in the latter part of the preceding year, reached a focus in February in the House of Commons in the nature of an amendment offered by an Irish member to reduce the naval appropriation unless the relief demanded was afforded Catholic sailors. It was asked that the Admiralty provide a Catholic chaplain for every squadron, with similar rank, pay, and allowances as those given to chaplains of the Established Church; to have a certain number of acting Roman Catholic chaplains where the number of their coreligionists among the sailors was large enough to need their ministrations; and to have a Catholic schoolmaster aboard every training ship. Considerable acrimony marked the discussion of the amendment, William Redmond quoting Cardinal Logue's pastoral protesting against Catholic parents allowing their children to enter a navy where absolutely no provision was made for their religious necessities. To this Austen Chamberlain replied that if the supply of recruits in the south and west of Ireland fell off, the training ship at Queenstown would be withdrawn. This ill-humored threat Mr. Goschen, First Lord of the Admiralty, hastened to soften by assuring the Irish members that some of the desired provision would be made. The strength developed for the amendment on the division gave zest to the Admiralty's eagerness to placate the opposition. After a number of conferences a system of shore chaplains was agreed upon, and chaplains for squadrons on active service and on all hospital ships were promised.

Another agitation, the results of which, if less

prompt, seemed likely to be more complete and satisfactory, was that looking toward the unification of the primary and secondary educational system for England and Wales. Under the system which had grown up in the past fifty years, Catholics had been allowed to build their own or voluntary schools, toward the support of which, as regards secular education only, a special aid grant had been annually made by Parliament, which amounted to about five sevenths of the cost of the secular education furnished. In addition to the subscriptions necessary to defray the extra two sevenths of expense, rates for the support of board schools in which nonconformist religious instruction was given were also levied upon Catholics. The Government before the elections announced its readiness (1) to unite all the schools under a central board as regards inspection and control, and (2) to provide a uniform system of secular education and uniform taxation to support it as soon as the different denominations concerned should agree upon the exact form of the measure. At a meeting of the English Catholic hierarchy resolutions were adopted calling for support of the schools out of the imperial exchequer on account of the inequality of rates. Accordingly a bill was introduced in October into Parliament providing, as regards secondary schools, for some of the reforms demanded.

Sunday, Oct. 7, was celebrated throughout England the golden jubilee of the restoration of the English hierarchy in 1850 by Pius IX, when Cardinal Wiseman was created Archbishop of Westminster.

For the first time for many years the Government, in forming a new administration, omitted to include a single Catholic, the Duke of Norfolk, who resigned his post as Postmaster-General to go to the war, being passed over in favor of his temporary successor. The new Parliament, however, had 4 Catholic members for England and 73 for Ireland, an increase of 1 and 4 over their representation in the Parliament preceding.

The estimated Catholic population of the United Kingdom was 5,500,000, and of the empire 10,500,000.

Charles Russell, Lord Chief Justice of England and its greatest Catholic layman since Thomas More, died Aug. 10, aged sixty-seven. With the exception of More, his was the highest judicial post ever held by a Catholic, and had he lived he would no doubt have succeeded More in the chancellorship.

Right Rev. John Vertue, D. D., Bishop of Portsmouth, died May 23, aged seventy-four. Other great losses to the Catholics of England occurred in the death of J. P. Crichton-Stuart, Marquis of Bute, Oct. 9, and Rev. Richard F. Clarke, S. J., Sept. 9.

Scotland.—The educational claims of Scotch and Irish Catholics were presented on the last Sunday in September in all the churches in Scotland by Archbishop Eyre of Glasgow, as forming an important issue in the general election then at hand. In Scotland all schools are denominational; but while the Presbyterian schools are supported by the Government, the Catholic schools receive no help from it.

The archiepiscopal see of St. Andrew's and Edinburgh was made vacant by the death of Most Rev. Angus McDonald, April 28, aged fifty-six. To succeed him, Right Rev. James A. Smith, Bishop of Dunkeld, was appointed Sept. 15. Another appointment of interest to the antiquarian was that of Rev. Francis McManus to the charge of a church erected during the year at Bannockburn, less than a mile from the battlefield.

Ireland.—The university question still held the center of the Irish stage, and as far as anything in the way of success greater than wide discussion was concerned seemed likely to continue to do so for a number of years. Speeches on the question were made without number, meetings by the score were held, and uncounted resolutions passed. These, as far as they went, were valuable as showing the temper of the people and the amount of sympathy enlisted in the cause. Chief among them was the pastoral of the Irish bishops, in synod assembled, in which the whole question was carefully gone over, and the argument ably presented. That the demand for a Catholic university for Ireland, Catholic in the sense in which Trinity College is Protestant, was entirely reasonable and just, was admitted by all or nearly all those who opposed it in the House of Commons when on March 23 the matter was brought to a vote. The university side was ably presented by Mr. Balfour and by the Irish members. There was no bill before the house, and the matter arose on a resolution that the Speaker leave the chair on the civil service estimates. Mr. Balfour urged Mr. Healy not to ask for a division, since the resolution presented a strict party question, division upon which furnished no criterion of the amount of sympathy the merits of the question commanded. Mr. Healy insisted, however, and the division disclosed 177 against the measure to 91 in support of it.

The Second Plenary Synod of Maynooth was held from Aug. 28 to Sept. 11. The first synod was held twenty years ago. Numerous ecclesiastical questions were discussed, and the pastoral already mentioned issued, in which the history of the Church in the island for the past twenty-five years was considered. The pastoral, besides its advocacy of the Irish national university, went into the question of intermediate education, and the system of national education was strongly condemned as antichristian. The agriculture act, providing for technical instruction in farming, was commended, though considered hardly radical enough to stop the drain of Irish emigration. The whole system of land laws, "in which rents are periodically made a matter of litigation before a tribunal in which neither side has confidence," was denounced, and in its place the bishops hoped to see as the solution of the Irish question a system of peasant proprietorship by which the great plains then almost worthless might be reclaimed, and the peasant himself restored to industry on his own land. The pastoral further condemned obscene literature, horse racing on Sundays, and secret political societies. The pastoral was published both in English and Irish.

Two questions of intermediate education, the first that of state support of denominational schools and the second the compulsory teaching of the Irish language in certain districts, were presented to the House of Commons by the Irish members. As to the first, complete support of Catholic schools by the state seemed as far off as ever when the debate ended. The plan for teaching Irish in the schools of the district where it was still the common language, while not formally adopted, was turned over to the Commissioners of National Education with permission to allow such teaching in exceptional cases.

The relief of Mafeking was celebrated by Orangemen in Belfast by breaking in the door of the Mater Hospital, and doing damage to Catholic churches and schools which cost the city corporation £3,000 to repair. The capture of Pretoria was similarly celebrated.

France.—The persecution of the religious congregations which took up so much of the time of

the French Chamber in 1899, was resumed in 1900 with singular ferocity. It began in January with the trial of the Assumptionist fathers. Like all French trials, the proceedings ranged from the merely offensive and irrelevant to the broadly comic. Twelve of the fathers were accused of being an association of more than 20 persons, and of dealing with questions of a political, social, and religious nature. In explaining the case for the prosecution, M. Bulot declared that 1,800,000f. were said to have been seen at the Assumptionist headquarters, and that there were grave reasons for supposing that the premises they lived in belonged to them. The gravamen of the charge, however, lay in the fact that the defendants published a newspaper in which the Government had been repeatedly criticised. The defendants were convicted and fined 16 francs, and their community was ordered dissolved as illegal. Although the priests appealed from the verdict and the Foreign Office practically promised to prevent the dissolution of the order on account of its mission work in the East, yet Cardinal Richard, who visited the fathers while under trial, was reprimanded by the Prime Minister, and the salaries of 6 bishops who had written letters of sympathy to them were stopped. When the Archbishop of Aix, Mgr. Gouthe-Soulard, who was one of the victims, denounced this act as a piece of spoliation, since the salaries paid by the Government to the clergy under the terms of the concordat are part of the compensation due by the state and accepted by the Church in lieu of the confiscated ecclesiastical property, the contumaciousness of the archbishop, for whose punishment no law existed, caused M. Waldeck-Rousseau to bring in a bill amending the penal code and punishing, without trial, any member of the clergy criticising the Government or any public authority. It was on the face of it so incompatible with all principles of popular liberty that the committee appointed to examine it recommended its abandonment.

A much graver matter, however, was the *loi de scolarité*, introduced in January into the Chamber, the object of which was to kill off the Catholic secondary schools. The bill proposed to make an attendance of three years at a *lycée* condition precedent to admission to such institutions as the Polytechnic, the Naval School, Saumur, Versailles, or Fontainebleau. In other words, if a youth desired to enter a military, naval, or civil service academy, he must have spent three years in a *lycée*. Achievement or excellence acquired elsewhere could not avail him, since it was not so much a point what he learned as where he learned it. The committee to which this bill was referred gave it a rebuff.

These two bills were introduced, however, and with them two others worse than the first, and to the passage of all four the ministry was committed. The third provided for the regulation of religious congregations. Its terms were, briefly, that six months would be allowed for congregations not "regulated" to become so; failing which, their property would be confiscated. The fourth measure presented the other horn of the dilemma. Those already regulated and those who might be driven into regulation by bill No. 3 met a heavy special tax, whose conditions would be certain to drive them into bankruptcy within a short time. None of the bills had been passed when the year closed, in spite of the efforts of the ministry. To inflame the Socialists, M. Waldeck-Rousseau had an inquiry made as to the property of the congregations. The result of the examination showed a total of 1,060,530,630 francs. While this was probably exaggerated for political purposes,

and because the phrase "a milliard of francs" made such a comfortable and impressive mouthful, still the sight of so much wealth at their disposal sharpened the appetites of the Socialists, and made exceedingly probable the passage of one or all of the bills before the session should end.

But what the Government could not accomplish in one way toward injuring and insulting the Catholics of France it could in another, and no reasonable opportunity was neglected. The acts ranged from mere comedy to the height of blasphemy. It had been the immemorial custom of the French navy to lower the flags and deck the vessels with crape on Good Friday. This year a telegram was sent to all the ports in France by the Minister of Marine to forbid the ceremony. M. Waldeck-Rousseau in April issued a ukase forbidding missions and special sermons by religious orders. And following their chiefs, the prefects and mayors joined in the hue and cry. In Tours Hospital the mayor ordered the crucifixes removed from the walls, and prohibited the circulation of any religious book, even a Catholic almanac being confiscated. In St. Florine the mayor issued an order interdicting the wearing of vestments by priests at funerals. Numerous cases of similar petty tyranny were reported, none, however, showing a more luminous conception of law and logic than the following: In Brest, early in February, a man named Jean Bartheleme was seized as he left the Jesuit College, having in his possession several articles which he had stolen from that institution. On his being brought to trial the public prosecutor held that the Jesuits had no legal existence, and that therefore there could be no theft of any articles belonging to them, and the prisoner was discharged.

The Pope in February conferred upon M. Brunetière the rare distinction of the order of Commander of Pius IX, in return for his signal services to the Catholic religion.

On the third anniversary of the fire which consumed the Charity Bazaar in Paris, May 4, 1897, and in which 115 lives were lost, was consecrated a memorial chapel in the Rue Jean-Goujon. The entire expense of it, 300,000 francs, was contributed by the Countess de Castellane.

By a brief dated Sept. 13, the Pope sent to the Archconfraternity of Our Lady of Compassion, organized for prayer for the conversion of England, his blessing and his hope for success. The extreme Left of the Chamber of Deputies immediately made outcry, saying that it would disturb international relations between England and France. But the affair was not so regarded in Downing Street, where no notice was taken of it.

Between Sept. 10 and 14 a clerical congress was held at Bourges, the first since the Revolution, attended by more than 800 priests.

Archbishop Ireland delivered the address at the unveiling of the statue of Lafayette presented to France by the United States. The ceremony was performed on July 4, and the archbishop's address was a long panegyric on Lafayette, the keynote of which was praise of liberty.

Pere Didon, O. S. D., one of the most famous preachers in France, died suddenly in Toulouse, March 10. Other vacancies in the ranks of the clergy were caused by the deaths of Mgr. Mando, Bishop of Angoulême, July 15; of Mgr. Gouthe-Soulard, Archbishop of Aix, Sept. 8; and Mgr. Baptifolier, Bishop of Meude, Oct. 1.

Germany.—A somewhat serious conflict was started in February between the Catholics of Alsace-Lorraine and those of the rest of the empire over the proposed erection of a Catholic faculty of theology at the University of Strasburg. The

question was one partly of educational methods, but more largely of national sentiment, since such a faculty at a thoroughly German university like Strasburg would be a powerful agent in Germanizing the clergy of the two dissident provinces. Counter-petitions were addressed to the Holy See by the Bishops of Strasburg and Metz on the one hand and the Catholic press and clergy of Alsace-Lorraine on the other. At last accounts the advantage was with the German element, represented by the bishops.

The eight hundred and fiftieth anniversary of the translation of the relics of St. Quirinus to Neuss, in the diocese of Cologne, was celebrated with great pomp and enthusiasm by the inhabitants of the town for a week in the middle of May. St. Quirinus is represented as the Roman tribune to whose care the Pope and other Christian captives were intrusted by Hadrian in 119 A. D., and who was converted by the Pope and died in martyrdom with him.

The dancing pilgrims of Echternach this year celebrated their pilgrimage to the shrine of St. Willibrod on Whit-Tuesday. Although the distance traversed was no more than a mile, it took three hours for any part of the troop of over 50,000 persons to traverse it. They dance to music, five steps forward and three back, which considerably lengthens their journey.

The Prussian Minister of Cult in February refused to recognize attendance at Fribourg, in Switzerland, as equal to attendance at German universities—a privilege theretofore accorded all German universities. The discrimination was publicly declared to have been made because Fribourg was under Dominican control.

The forty-seventh annual Catholic Congress of Germany met at Bonn in September, and drew up a number of resolutions, under eight different heads, as the outcome of its discussions. Of these the most important were that calling for the freedom of the Holy See and that outlining a plan for denominational education.

The statistics of the Catholic population of the empire, published in August, showed a falling off of more than 6 per cent. in Baden, about 3 per cent. in Prussia, and a less fraction in the other duchies.

Italy.—Although the feeling between Church and state was not at all modified by any events of the year, the two moved together throughout twelve months with comparatively little friction. The stoppage of a French pilgrimage from Marseilles, ostensibly for quarantine purposes, was probably as much a national demonstration as a religious one. His Holiness, in an informal manner, sent to Queen Margherita the expression of his sympathy and regret at the death of King Humbert. The Queen sent to Mgr. Bonamelli, Bishop of Cremona, a prayer for which she sought ecclesiastical approbation. It was refused, however, on account of its form.

In a letter to the Cardinal Vicar of Rome the Pope protested in August against the proselytizing being carried on in the Holy City by American missionary societies. Although as a reprisal the Liberals proposed removing police protection from occasions of military and official celebration in St. Peter's, the new King promptly prevented any such unwise measure. His Majesty, however, even in his accession proclamation declared his intention of continuing his father's policy of *Roma Intangibile*, or the preservation of the city from the aspirations of the papal see.

Austria-Hungary.—The evil of dueling in the Austrian army was accentuated in August by the trial and dismissal from the army of Marquis Tacoli for refusing to fight a duel. The marquis

had occasion to protest against the utterances of a slanderer, whom military etiquette required him to challenge. He refused to do so on the ground that he as a Catholic objected on principle to dueling. The officers' court of honor thereupon convicted him of cowardice, and the Ministry of War canceled his commission. It developed on the inquiry that another officer had written to the marquis commending his stand. The writer, who turned out to be Captain Ledochowski, a young headquarters officer of distinction, and a nephew of the cardinal prefect of the Propaganda, was also dismissed from the army. The investigation of a second letter of congratulation to the marquis disclosed the fact that it was written by the Infant Don Alfonso de Bourbon. There was no talk of dismissing him from the army, and under the stimulus of his advice and the influence of the personages affected by the two dismissals a movement began for the abolition of compulsory dueling.

Under the direction of Countess Maria Teresa Ledochowski an antislavery congress was held in Vienna, Nov. 22 to 27.

Pope Leo XIII in September addressed a letter to the Archbishop of Salzburg warmly encouraging the project of a Catholic university at that place. Of the 9,000,000 kronen needed for its maintenance 1,000,000 was subscribed during the year, and it was expected that the balance would be raised within five years.

The nine hundredth anniversary of the Church in Hungary was celebrated in August in the Cathedral of Grau, where St. Stephen was baptized and crowned King with a crown sent him by the Pope. The celebration was attended by the Hungarian Premier and all his Cabinet.

Archbishop Julian Kinowski, Uniate Greek Metropolitan of Lemberg, died May 4, aged seventy-four years.

Belgium.—On Sunday, May 25, the new system of elections in Belgium received a fair trial, and resulted in a Catholic majority of 18 members in the Chamber of Representatives and a substantial majority in the Senate. The result in the Chamber represented a decrease from a previous majority of 72, but the better tone prevalent among the minority more than made up for the forfeiture of additional strength by the Catholic party, and justified the workings of the new law.

The Belgian Chamber in April began work on its project for raising the salaries of ecclesiastics of all ranks. The scale proposed ranged from \$160 to \$420 per annum, conditioned on length of service.

The Catholic family of Aremburg, the most illustrious in Belgium, removed entirely during the year to Germany, where it has extended possessions. Its residence in Brussels, the ducal palace built in 1548, where Count Egmont once resided, was sold to the Government. The family is descended from Jean de Ligne (1442), and the heads of it have been counts of the Holy Roman Empire since 1549.

A committee formed in Belgium in November presented an appeal to the Holy Father to condemn anti-Semitism, and especially to dispel the legend of the practice of ritual murders.

Holland.—In the face of a promise of a Government subsidy to Catholic schools, the Liberals refused to allow any appropriation for the purpose, declaring the promise not binding. Mgr. Schaepman, the leader of the Catholic party, was induced by the promise to join the Liberals on the question of compulsory education, and owing to his defection the compulsory school

bill passed by one vote. The law is to come into effect Jan. 1, 1902, when Catholic pupils will be forced to attend the state schools, unless the promised subsidy is made, since their own schools are not large enough for all Catholic pupils who come under the provisions of the law.

Latin America.—The work of revivifying and reorganizing the Church in Latin America, inaugurated by his Holiness by the Plenary Council of Bishops of Latin America held at Rome in 1899, was continued by him throughout the following year. In March the Sacred Congregation for Extraordinary Ecclesiastical Affairs issued a decree to the bishops regulating fasts, and providing for the promulgation of an eighty days' indulgence. In May the secretariate of state by brief conveyed to the bishops the wish of the Holy Father that in each ecclesiastical province a meeting of the ordinaries be held at least as often as once every three years; and asked a strict observance of the enactments of the council, especially the ordinances relating to the conversion of the Indians, the study of the vulgar tongue, the deferring of infant baptisms and negligence in administering the sacraments to the sick. The Pope also sent an apostolic letter to the bishops of Brazil, urging the establishment of ecclesiastical seminaries, the organization of literary mediums to educate the people, an intelligent interest in politics, and proper and systematic provision for the support of Catholic institutions. His Holiness's interest was marked by a great Catholic revival in South American countries. A congress held at Bahia in June was attended by clergy from all parts of the continent, and practical methods were adopted of carrying the Pope's recommendations into effect.

Australia.—The new cathedral at Sydney was dedicated Sept. 9 by Cardinal Moran. In the sanctuary besides the bishops of Australia were Earl Beauchamp, Governor of New South Wales, Lord Lamington, Governor of Queensland, and Mr. Le Hunte, Lieutenant Governor of British New Guinea. The cost of the cathedral was £220,000, and it had been building since 1868. A Catholic congress, lasting six days, was held Sept. 9 to 15, at the initial session of which Lord Beauchamp was present. The site of the new cathedral is that of the first Catholic church in Australia, of which the foundation stone was laid by Gov. Macquarie in 1821.

China.—The outrages in China by the Boxers fell with especial severity upon the Catholics, who were the first victims of the antipforeign fury. That part of this fury, as regards the Catholic priests especially, was due to the anticlerical crusade in France, was asserted by those most familiar with the situation. Lord Curzon, Viceroy of India, who visited Peking in 1894, thus summed up the situation:

"China resents the foreigner at best, and the missionary in any case must take his life as well as his crucifix into his hands. This he well understood. But in aggravation of the normal anti-foreign feeling of the Chinese population came the knowledge that France herself had ousted those Jesuits, those orders, whom China was to be made to receive at the mouth of the Mauser, whom China herself was forbidden to eject. The castaways of a European country were to be her enforced guests—the refuse of France was to be made welcome by the stranger. Insult was thus added to the injury of the intrusion. The nation could not draw subtle distinctions; it had the plain fact before it that the soul physicians France would not permit to practice on its own people were to be thrust upon the devotees of another

creed; that the men whom France accused of treachery to the state were to be let loose on a Government to whom no loyalty was owed. This is the deed that France has done; and the horrors of to-day, in which we and the other countries of Europe suffer an undue share, are but the sequel of the expulsion of religious orders from the republic."

The number of Catholic priests and bishops who fell before the Boxers had not been counted at the end of the year, and the number of native Christians who perished can only be guessed at. Among the more prominent victims were Right Rev. Laurence Guillon, Vicar Apostolic of South Manchuria; Bishop Ferdinand Hamer, Vicar Apostolic of Southwest Mongolia; Bishop Fantasoti, Vicar Apostolic of South Hunan; Bishop Gregory Grassi, Vicar Apostolic of North Shensi; and Bishop Francis Fogolla. The known massacres included 32 European priests and 10 nuns. Much missionary property was destroyed, including the Peking cathedral. The Catholics in China before the outrages numbered 762,758, with 942 European and 445 native priests, 4,348 churches and chapels, and 4,054 schools with 65,990 pupils.

Other Missionary Countries.—Leo XIII, on Feb. 5, gave 500,000 francs for the Church of the Copts in Egypt, and on the same day he made a similar gift on behalf of the provincial seminary at Kandy in Ceylon.

The Uniate Chaldean Church of Mesopotamia received a new head by the election, July 8, of Mar Joseph Emmanuel Thomas, Bishop of Seert, to the vacant patriarchal throne of Babylon, which embraces 3 archbishoprics and 9 bishoprics situated in Asiatic Turkey and Persia.

On May 13 was solemnly consecrated the Basilica newly erected upon the site of the one built near Jerusalem by the Empress Eudoxia in the fifth century to mark the spot where St. Stephen was stoned to death.

By a decree issued in June, and signed by the Viceroy of Szechuen, the first and second chiefs of Bathang, and the superior of the lamasery of Tin-Lin-Se, the door of Tibet, which has long been closed to Christianity, was opened to missionaries. By the decree, which was engraved on wood, the natives are not only allowed to become Christians, but are freed from any taxation in support of the national religion.

The work of reunion among the schismatics of the East received great impulse from the reconciliation of the Armenian Vicar General of Tauris, who was followed into the Church by 6 entire villages and more than 1,800 families.

A Eucharistic Congress was held at Goa, in Portuguese India, the second week in December, and was attended by all the Catholic bishops of the Indian hierarchy, as guests of the Queen of Portugal. The chief subject taken up was the condition of Catholics in Mysore, Cochin, and Travancore. In these states all Christians are considered civilly dead, and their property confiscated. The matter had been previously laid before the Viceroy of India both by the native Christians of Madras and the ruler of Mysore, who proposed to abolish the law. The Viceroy, however, refused to allow the repeal of the law, because, as he said, the number of persons concerned was infinitesimal, and that they were of humble station and possessed but little property. To the first point in Lord Curzon's reply, the bishops answered that the native Christians numbered a fourth of the population; to the second they pointed out the obvious injustice of expecting persons civilly dead and deprived of their property to be either wealthy or proud, a condi-

tion precedent, apparently, to their receiving any attention from the Viceroy. They also called to his notice that one poor Christian was as much entitled to the protection of the law as a million wealthy ones. Failing to obtain any redress from him, they presented the matter to the Crown.

ROOSEVELT, THEODORE, twenty-fifth Vice-President of the United States, born in New York city, Oct. 27, 1858. His father, also named Theodore, a merchant and philanthropist, was of Knickerbocker stock, and his mother was a descendant of Archibald Bulloch, the first President of Georgia in the Revolution. Their son was a sickly boy, but rigid discipline and systematic exercise brought him vigorous strength. He was prepared for college in private schools, and was graduated at Harvard in 1880. After traveling in Europe he began the study of law, but abandoned it for politics. In 1881 he was elected by the Republicans to the Assembly from the Twenty-first District of New York city, and was twice re-elected. The first two Legislatures in which he sat were Democratic. In his second year he was leader of the minority in the Cities Committee, and he became its chairman in the Republican Legislature of 1884, after being an unsuccessful candidate for Speaker. He was active in promoting the passage of the first New York civil service laws, was chairman of a committee that investigated abuses in New York city, and secured acts abolishing the fee system in county offices and depriving the aldermen of veto power over the mayor's appointments. He favored a bill reducing elevated railroad fares, but when Gov. Cleveland vetoed it he sustained the veto.

After retiring from the Legislature he bought a ranch in North Dakota, being an enthusiastic sportsman, and for many years he has spent his vacations in hunting trips.

In 1884 he was a delegate at large to the Republican National Convention, where he advocated the nomination of George F. Edmunds, but he supported Mr. Blaine in the campaign. The Republicans nominated him for mayor of New York in 1886 against Henry George, the United Labor candidate, and Abram S. Hewitt, the Democratic candidate, who was elected. President Harrison appointed him a civil service commissioner in 1889. He served efficiently until May, 1895, when he resigned, and became president of the New York city Board of Police Commissioners in the administration of Mayor Strong. He established a policy of strict enforcement of liquor and Sunday laws, and this aroused much opposition, but it stopped police protection of vice and restored discipline to the force.

Mr. Roosevelt was appointed Assistant Secre-

tary of the Navy in April, 1897, and took an important part in the preparations for the Spanish War. At the outbreak of hostilities he resigned his office and raised, largely among the Western cowboys, one regiment of the volunteer cavalry, who were known as Rough Riders. He became lieutenant colonel, with Dr. Leonard Wood, of the regular army, in command. From 1884 to 1888 he had been a member of the Eighth Regiment, National Guard of New York. The Rough Riders (unmounted) were with the army before Santiago, and took part in the fight at Las Guasimas, June 24, 1898, and in the capture of San Juan Hill on July 1. Col. Wood was pro-

THEODORE ROOSEVELT.

moted brigadier general on July 8, and Lieut.-Col. Roosevelt became colonel. He was mentioned in the reports for gallant conduct in battle, and was distinguished for care of his men in camp.

After the surrender of Santiago the troops were ordered to the mountains because of yellow fever. Col. Roosevelt participated in the preparation of a round robin by the officers, demanding that all except the immune regiments be brought home at once. This was sent to the Secretary of War, and was also given to the press. Secretary Alger then ordered the troops home, at the same time forbade unauthorized publication of reports, and retaliated on Col. Roosevelt by publishing a letter from him asking that the Rough Riders be

taken with the regulars to Porto Rico because they were "as good as any regulars, and three times as good as any State troops" that were "armed with black powder, Springfields, or other archaic weapons." The Secretary likewise published his own reply: "I suggest that, unless you want to spoil the effects and glory of your victory, you make no invidious comparisons." This was considered an attempt to prejudice the National Guardsmen against the colonel, and was used in subsequent political campaigns. The letter was generally interpreted, however, not as a reflection on the volunteer soldiers, but merely as an impulsive statement of the truth concerning the comparative inefficiency of the weapons with which they were armed.

Col. Roosevelt returned with his regiment to Montauk Point in August, 1898, was nominated for Governor of New York by the Republicans at Saratoga, Sept. 27, 1898, and was elected for the two years' term beginning Jan. 1, 1899, by a plurality of 17,786 over Augustus Van Wyck, Democrat. As Governor he reformed the administration of the canals, favored the enactment of an improved civil service law, and applied the merit system in county offices. By a special message he induced the Legislature of 1899, at the end of the session, to pass an act taxing as real estate the value of railroad and other franchises to use public streets. Corporations and Republican leaders protested, but the Governor said he would sign it as it stood unless they could improve it without destroying its essential features. He called an extra session of the Legislature, secured the passage of the bill in modified form, and established the principle of street-franchise taxation.

Columbia University made Gov. Roosevelt a doctor of laws in 1899. Early in 1900 he was mentioned for Vice-President, but he desired a second term as Governor, and repeatedly announced that under no circumstances would he accept the vice-presidency. The New York party leaders, however, did not want him to be a candidate again for Governor, and, though pledged to respect his wishes, they joined Western delegates who were enthusiastic over Gov. Roosevelt's military record, and at the Philadelphia convention on June 21, 1900, forced him to accept the nomination for Vice-President. He made an extended speaking tour through the Western States, and was elected for the term beginning March 4, 1901, receiving 292 electoral votes, while 155 were cast for Adlai E. Stevenson, the Democratic candidate.

In 1882 Mr. Roosevelt published a *Naval History of 1812*. This was followed by *Hunting Trips of a Ranchman*, in 1885; a *Life of Thomas H. Benton*, in 1886, and a *Life of Gouverneur Morris*, in 1887, both in the *American Statesmen Series*; and in 1888 by *Essays in Practical Politics and Ranch Life and Hunting Trail*. The first two volumes of his most important work, *The Winning of the West*, were issued in 1889. In 1890 he wrote a *History of New York City for the Historic Towns Series*; in 1893, *The Wilderness Hunter*; and the next year published the third volume of *The Winning of the West*. In 1897 he collected a volume of essays entitled *American Ideals*, which he followed with *The Rough Riders* in 1899, and *Oliver Cromwell* and a volume of addresses entitled *The Strenuous Life*, in 1900. He is also the author, in collaboration with Henry Cabot Lodge, of *Hero Tales from American History*, and he was one of the assistants of William Laird Clowes in the preparation of *The Royal Navy*.

ROUMANIA, a kingdom in eastern Europe. The legislative power is vested in a Senate of 120 members, of whom 109 are elected by two classes of property holders, 2 by the universities, 8 are bishops, and 1 is the heir to the throne, and a Chamber of Deputies, containing 183 members, elected for four years by all taxpayers, divided into three classes. The reigning King is Carol I, born April 20, 1830, a son of Prince Karl of Hohenzollern-Sigmaringen, elected Domn of Roumania in 1866, and proclaimed King on March 26, 1881. The Cabinet, constituted April 23, 1899, was composed in the beginning of 1900 as follows: President of the Council and Minister of the Interior, George Cantacuzene; Minister of Finance, Gen. G. Mano; Minister of War, Gen. Jacob Lahovary; Minister of Education, Take Jonesco; Minister of Justice, C. G. Dissesco; Minister of Agriculture, Industry, Commerce, and Domains, N. Fleva; Minister of Foreign Affairs, J. N. Lahovary; Minister of Public Works, Dr. C. I. Istrati.

Area and Population.—The area of Roumania is 48,307 square miles, with a population of 5,800,000, including 200,000 in the Dobrudja. The people of Roumanian race number about 4,950,000 in the old provinces of Wallachia and Moldavia and 90,000 in the Dobrudja. There are about 300,000 Jews, 200,000 gypsies, 50,000 Bulgarians, 38,000 Austrians, 20,000 Germans, 20,000 Greeks, 15,000 Armenians, and 7,000 French, Hungarians, English, Italians, Turks, Poles, and others in the original provinces, and 40,000 Bulgarians, 30,000 Turks, 20,000 Russian sectarians, 10,000 Greeks, 4,000 Jews, 3,000 Germans, and 3,000 others in the Dobrudja. Education is free and is compulsory where schools exist, but for the rural population there are not half enough schools. The rural primary schools had 4,078 teachers and 220,420 scholars in 1897, the urban schools 1,333 teachers and 77,863 scholars, including 15,659 in private schools. There are 8 normal schools, with 770 students; 52 secondary and high schools, with 1,143 teachers and 18,969 pupils; and the universities of Bucharest and Jassy, with 110 professors and 1,650 students. The state maintains besides special schools for agriculture, engineering, etc. The sum appropriated for primary instruction in 1896 was 9,140,527 lei, and for secondary instruction 5,970,942 lei.

Finances.—The revenue for the year ending March 31, 1899, was 221,935,617 lei, and the expenditure 206,042,202 lei. For the financial year 1900 the estimates were 228,376,000 lei of revenue and of expenditure. For the year ending March 31, 1901, the budget estimate of revenue is 242,599,000 lei, of which 41,450,000 lei are derived from direct taxes, 76,260,000 lei from indirect taxes, 55,260,000 lei from state monopolies, 23,772,000 lei from the Ministry of Agriculture, Industry, Commerce, and Domains, 16,492,000 lei from the Ministry of Public Works, 11,385,000 lei from the Ministry of the Interior, 4,690,000 lei from the Ministry of Finance, 1,113,000 lei from the Ministry of War, 260,000 lei from the Ministry of Instruction and Worship, 286,000 lei from the Ministry of Foreign Affairs, 421,000 lei from the Ministry of Justice, and 11,200,000 lei from various sources. The estimate of expenditure for 1901 is also 242,599,000 lei, of which 91,933,592 lei are for the public debt, 71,300 lei for the Council of Ministers, 50,240,609 lei for the Ministry of War, 29,446,792 lei for the Ministry of Finance, 30,900,374 lei for the Ministry of Worship and Public Instruction, 19,556,785 lei for the Ministry of the Interior, 5,300,000 lei for the Ministry of Public Works, 8,716,056 lei for the Ministry of Justice, 5,043,388 lei for the Ministry of Agriculture, Industry, Com-

merce, and Domains, 1,816,200 lei for the Ministry of Foreign Affairs, and 1,573,900 lei for supplementary credits.

The public debt on Dec. 1, 1899, amounted to 1,280,719,683 lei, more than half of it borrowed for railroads and other public works, and the remainder for purchasing lands for the peasantry, reducing unfunded debt, and covering deficiencies of revenue. A loan of 175,000,000 lei was issued at 5 per cent. in November, 1899, to construct additional railroads and public works.

The Army and Navy.—The permanent army has a peace strength of 3,280 officers and 60,000 men, with 11,930 horses and 390 guns. The period of service is three years in active service and seven years in the reserve, and Roumanians who are not drawn at the age of twenty to serve in it are members of the territorial army for five years, or four years in the cavalry, and then of the territorial army reserve until they are thirty years old. The strength of the territorial army is 72,000 men on a peace footing, and its war strength 3,948 officers and 168,000 men, with 36,604 horses. After the age of thirty all belong to the militia for five years, and then for ten years to the *gloata*, or general levy. The infantry weapon is the Mannlicher rifle of the model of 1893.

The naval force of Roumania consists now of a protected cruiser, a training brig, 7 gunboats, 6 coast guards, a dispatch steamer, and 6 first-class and 2 second-class torpedo boats. Additional gunboats will be built in a floating dock brought from Scotland, and 2 armor-clad vessels are projected.

Commerce and Production.—The yield of wheat in 1899 was only 9,184,930 hectolitres on 1,661,360 hectares, against 20,600,100 hectolitres on 1,453,600 hectares in 1898. The production of rye in 1899 was 700,700 hectolitres; of barley, 1,600,920 hectolitres; of oats, 2,204,410 hectolitres. The production of maize in 1898 was 35,912,000 hectolitres, from 2,120,070 hectares; of plums, 929,320 hectolitres were produced in 1898; of wine, 517,280 hectolitres; of tobacco, 25,500 quintals; of colza, 123,150 hectolitres; of flaxseed, 238,135 hectolitres; of hemp, 62,130 hectolitres; of hay, 13,947,250 quintals. The state lands sold from 1868 down to 1896 were 571,518 hectares in extent, valued at 210,130,000 lei. The state forests cover 931,727 hectares, and produce a gross income of 2,338,000 lei. The general trade of Roumania in 1898 was 389,908,439 lei for imports and 283,181,567 lei for exports.

The European Commission of the Danube.—The Danubian Commission, created in 1856 and composed of delegates of Germany, England, Austria-Hungary, France, Italy, Roumania, Russia, and Turkey, has power to collect tolls from vessels navigating the Danube below Braila, and to apply them to improving the navigation of the river. The dredging operations at the Sulina mouth deepened the water over the bar from 20½ feet in 1890 to 24 feet in 1895, so that in 1899 only 2 vessels had to complete loading out in the roadstead, against 142 in 1894. The cutting through one of the loops of the great double bend of the river near the mouth was finished in 1894; in 1897 a channel was thrown open, straightening the river farther up; in 1898 still another cutting was completed, and the dredging of a channel through Lake Obsetin was then begun, and will be completed in 1902. This will make the river from Sulina up to Tulcha almost as straight as a canal. The depth of water in the channel has not only been maintained, but improved by means of groins, and the danger of the formation of banks in the Sulina channel is thereby reduced to a minimum.

Exodus of Roumanian Jews.—The education law of 1893 barring Jews from the public schools is the most serious of the disabilities that the Roumanian Government has imposed upon the Jewish race, but it is only one of the political, social, and economical wrongs that make life for the Roumanian Hebrew difficult and bitter in the best of times, and almost impossible in a period of commercial and industrial depression such as was caused in 1900 by the failure of harvests in the previous year. The Jews of Roumania must serve in the army and bear all other civic burdens. They are of Roumanian nationality before the law, and yet are aliens, foreigners by law though born in the land, capable of acquiring citizenship only by naturalization, which is generally denied to them. They have been driven out of all the honorable professions, excluded from industries, and refused the right of living in the rural districts and earning their support by agriculture. As a corollary to their civic ostracism they have frequently been assailed by riotous bands of students and workmen, reviled with incendiary violence by the press, and subjected to the insults and menaces of the Anti-Semitic League, which has branches in all towns and has organized an anti-Jewish crusade all over the country. An article in the Berlin Treaty expressly provided against the discriminations that have been laid upon the Jews by declaring that "in Roumania the difference of religious creeds and confessions shall not be alleged against any person as a ground for exclusion or incapacity in matters relating to the enjoyment of civil and political rights, admission to public employments, functions, and honors, or the exercise of the various professions or industries in any locality whatsoever." The only step that has been taken toward compliance with the treaty is a modification of the article of the Roumanian Constitution that made naturalization inaccessible to Jews. The new naturalization law, instead of declaring the general enfranchisement of native Jews, requires an individual application from every Jew, and attaches onerous conditions and formalities to such applications, and even when these have been fulfilled the Legislature almost invariably rejects them, only 100 Jews, members of wealthy families, having succeeded in obtaining the rights of citizenship since 800 Jewish soldiers were naturalized after Plevna by a single act. Even then the naturalization is only personal, so that the children of the 900 Jewish citizens of Roumania are aliens in the sight of the law. In the schools 3,000 Jewish children are admitted upon the payment of fees, from which all Roumanians are exempt. This is only a tenth of the children of school age among the Jews, and the Jewish private schools that have been founded in many parts of the country are hampered in every way. They are supported mainly by the voluntary tax paid by Jews on meat slaughtered according to the ritual, the *gabella*, which the Roumanian Government has attempted to suppress on the pretext that the Jewish method of slaughtering animals is inhumane. From the normal and the professional and art schools the Jews are excluded, and in the universities, by a new law for aliens, which means Jews, for Christian foreigners can obtain naturalization without hindrance, the fees, especially in the medical faculty, have been fixed at prohibitive rates. Though Jews must perform military service in the ranks like other Roumanians, they can not receive commissions nor serve as one-year volunteers. No Jew can hold a post in the hospitals, nor an office on a Roumanian railroad, nor practice as a lawyer, an architect, a veterinary surgeon, or an apothecary, nor take part in the direction of

the schools or universities, nor belong to the Chamber of Commerce, nor be employed in the national bank. From all offices in the Government civil services Jews are of course excluded. No Jew may sell tobacco or salt. The hawking law of 1884 has been enforced year by year with more rigor, and 20,000 Jews affected by it have been reduced to starvation. Under a series of vagrant acts applied oppressively to Jews they have been expelled from rural districts and compelled to settle in the congested towns. An identical note was presented in 1880 by England, France, and Germany protesting against the requirement of individual naturalization from persons belonging to a non-Christian creed domiciled in Roumania and not belonging to any foreign nationality as an evasion of the Treaty of Berlin. No attention was paid to this representation. The acts of the Government and the treatment of the people became harsher and more oppressive. In 1897 came the anti-Jewish riots and charges of ritualistic murder, which were followed by the excesses of the Bucharest mob in December, 1898, and anti-Semitic disturbances in Jassy in May, 1899. Apologists for the Roumanian Government argued that the injustice and persecutions could not be as severe as they seemed because the Jews did not leave the country. The famine and business stagnation of 1900 suddenly impressed masses of the Jewish population with a feverish desire to escape from Roumania at any risk and cost. The constantly growing Anti-Semitic League bound its members to give no employment to Jews nor to have business dealings with them. In the severe winter of 1898 the Government gave generous aid to the destitute and famishing peasantry, while the poor Jews had to depend only on the charity of their richer brethren. Some of the townspeople in Moldavia started emigration societies during the winter, and the movement spread over the whole kingdom. The emigrants started out in bands, some without money, some on foot, to seek new homes under benignant conditions. One stream of emigration was directed to Anatolia, one to Cyprus, another to Canada, the greatest to the United States. About 16,000 left their homes in the first half of 1900. In passing through Austria-Hungary they camped in the open air, being unable to pay for the poorest lodgings. The exodus grew to such proportions that the Roumanian authorities tried to stay it by refusing to give passes to intending emigrants unless they signed a declaration stating that they were vagrants without the means of subsistence. Next the Austro-Hungarian authorities, driven to take precautionary measures, informed the Roumanian Government that Jewish emigrants not provided with railroad tickets to Hamburg, Paris, or London would not be permitted to pass the frontier; consequently the Roumanian authorities refused to grant a pass to anybody who could not produce such a ticket. The first of the bands started out from the town of Berlad and tramped through the country, endeavoring to beg enough money to carry them to their new home. Similar societies sprang up in Jassy, Botoshani, Roman, Bucharest, Bacan, and soon in every town and village where there was a considerable Jewish laboring population. All were sworn to leave Roumania forever. Professional men, the trading class, and skilled laborers turned their eyes to the United States. Those who placed less reliance on their individual ability were drawn toward Canada by the offer of 100 acres of Government land. The very efforts of the Roumanian police to stop the exodus served to rouse the desire among many who had no cause to leave on their own account to join the flight of their coreligionists. The restless, the thriftless,

the idle, and the vicious joined the movement. When the first groups of exiles arrived in New York, nearly the whole of them were barred by the law against pauper immigration, and were detained. Some were released on the undertaking of some of their American coreligionists to provide settlements for them and guard against their becoming a burden on the community. Representations were made to the Government of Roumania, which was informed that immigrants arriving with no means of subsistence would be returned to the country whence they came. Later an agent of the Treasury Department was dispatched to Roumania to investigate the condition of intending Jewish emigrants to North America, both those whose declared destination was the United States and those who took passage for Canada and were likely to cross over into the United States after arriving in that country. The Dominion Government, when the stream began to pour into Canada, announced that it would receive no more Roumanian immigrants unless they possessed the means of establishing themselves. The Austro-Hungarian Government therefore refused to let any more pass the border, and posted troops on the Hungarian frontier to keep them back. There were 1,000 in Hungary and 2,000 in Vienna who were sent back to Roumania. When the last ones who had entered Hungary were escorted back to the border the Roumanian authorities refused to readmit them, and they endured great hardships and privations while the officials of the two countries were quarreling about their status.

Political Affairs.—The Conservative and the Constitutional parties having united, placing the ministry in a minority, the Cantacuzene Cabinet resigned in a body on July 17, and M. Carp was charged by the King with the formation of a Conservative coalition ministry. It was composed of four Junimists and four members of the retiring ministerial party. Minister Jonesco, in order to raise money to pay the coupons of the public debt next falling due, planned to sell to the national bank the shares of its capital owned by the Government. The hard conditions demanded by the bank directory before completing the transaction were not liked in influential Conservative circles. The new Cabinet was constituted on July 19 as follows: President of the Council and Minister of Finance, Carp; Minister of the Interior, Onalesco; Minister of Foreign Affairs, Margiloman; Minister of Agriculture and Domains, Filipesco; Minister of Justice, Majoresco; Minister of Education, Arion; Minister of War, Gen. Lahovary; Minister of Public Works, Jonel Gradisteano. The fusion Cabinet had to deal with the serious international dispute arising out of the murder of Prof. Mihaileano at Bucharest and the terrorism to which Roumanians in Sofia were subjected by the Macedonian Revolutionary Committee because of the interest taken by the Roumanian Government and expressed by Roumanian publicists in the Wallachian race in Turkey and the preservation of their nationality and language. The Roumanian colony in Sofia is composed of wealthy Macedonian merchants, most of whom have become naturalized Roumanian citizens. They were naturally in sympathy with the Roumanian national movement in Macedonia and opposed to the plans of the revolutionary Bulgarians, who aimed to annex Macedonia to Bulgaria and would recognize no nationality there except their own. When these Roumanian citizens of Macedonian origin declined to contribute money for the agitation of the Macedonian Committee they were first threatened, then some of them were assassinated, and one of their leaders was kidnaped and put to torture, while an-

other escaped and took refuge in Bucharest. Those who remained, intimidated now, paid the blackmail, amounting to 200,000 francs. The murderer of Prof. Mihaileano was encouraged to do the deed by the president of the Macedonian Committee, a retired officer of the Bulgarian army. The distrust of Roumania and Bulgaria one for the other began with the reassertion of Russian influence in Bulgaria after the fall of Stambuloff in 1894 and the gravitation of Roumania toward Austria. The activity of the Bulgarian propaganda in the Dobrudja caused the dismissal of some Bulgarian schoolmasters, and impelled the Roumanian Government to build a strategic bridge over the Danube at Tchernavoda.

When the Macedonian Committee first made demands on the Roumanian citizens resident at Sofia for contributions under penalty of assassination the Roumanian agent at Sofia made representations to the Bulgarian Government without any satisfactory result. A Roumanian notable named Flava was shot and wounded on June 16, 1900, by a revolutionary journalist, and this led the Roumanian Minister of Foreign Affairs to address a strong note to the Prime Minister at Sofia. The Roumanians in Sofia decided to pay the contribution of 30,000 francs demanded at that time, upon which the Roumanian minister sent another note demanding the prosecution of the members of the Macedonian Committee for blackmail. The murder of a Bulgarian named Fitoffski in Bucharest by a man, who was dispatched from Sofia for the purpose, the murdered man having been suspected of being a Turkish spy, had placed the Roumanian Government in possession of documentary evidence against the heads of the Revolutionary Committee in Sofia. The murderer confessed that Trifanoff, the president of the Bucharest branch of the Macedonian Committee, had pointed out the man to be struck down, and in their search the police found letters of Sarafoff in connection with the affair. The murder of Prof. Mihaileano, who was a Macedonian by birth, as was also his murderer, occurred on July 22. The confessions of Trifanoff and of Dimitroff furnished additional evidence against the members of the Central Committee, one of whom was an uncle of Dimitroff. The Roumanian Government therefore renewed its demand for the arrest and trial of the directors of the committee—Sarafoff, Kovacheff, and Davidoff—all former Bulgarian officers, although no reply had yet been received to the previous communication. In reply to the remonstrances of the Roumanian minister, the Bulgarian Premier Ivanchoff declared that he could not take action against accused persons until the evidence on which to prosecute was in his hands. The Roumanian Government supposed this to mean that the Bulgarian Government would do nothing until the Roumanian courts had established the guilt of the accused, and became more urgent in its demands. The dispatch of troops from both sides to the frontier followed, but shortly they were withdrawn when satisfactory explanations were given.

The deficit in the budget was found to be 43,000,000 lei. Arrears of taxes could not be collected. Although the harvest was fair, it fell below expectations, and nearly every branch of the revenue declined. The Government proposed to sell the cigarette paper monopoly to Berlin bankers for 15,000,000 lei, petroleum rights in the western Carpathians for 10,000,000 lei, the Government shares in the national bank for 13,000,000 lei, and a part of the state forests for 5,000,000 lei. These proposals were vigorously assailed by the Opposition. In the autumn a peasant uprising in oppo-

sition to the new taxation occurred in the Ranniku and Busoe districts, and in taking possession of Pirkoff the troops killed one peasant and wounded several after three officers and some of the soldiers were wounded. The regular session of Parliament was opened on Nov. 28. Economy was promised, but without any reduction in the army.

BUSKIN, JOHN, an English author, born in London, Feb. 8, 1819; died in Coniston, England, Jan. 20, 1900. He was the only son of a prosperous wine merchant, from whom he inherited a large fortune, and upon whose tombstone the son was justified in writing, as he did, "An entirely honest merchant." Of his father, Ruskin writes in *Præterita*, his autobiography: "My father was a dark-eyed, brilliantly active, and sensitive youth. He had learned Latin thoroughly, though with no large range of reading, under the noble traditions of Adams at the High School of Edinburgh; while, by the then living and universal influence of Sir Walter Scott, every scene of his native city was exalted in his imagination by the purest poetry and the proudest history that ever hallowed and haunted the streets and rocks of a brightly inhabited capital." Of his mother he says: "I do not know for what reason, or under what conditions, my mother went to live with my Scottish grandfather and grandmother, first at Edinburgh, and then at the house of Bower's Well, on the slope of the hill of Kinnoull, above Perth; but certainly the change for her was into a higher sphere of society—that of real, though sometimes eccentric and frequently poor, gentlemen and gentlewomen. She must then have been rapidly growing into a tall, handsome, and finely made girl, with a beautiful, mild firmness of expression; a faultless and accomplished housekeeper, and a natural, essential, unassailable, yet inoffensive prude. I never heard a single word of any sentiment, accident, admiration, or affection disturbing the serene tenor of her Scottish stewardship; yet I noticed that she never spoke without some slight shyness before my father, nor without some pleasure to other people, of Dr. Thomas Brown." He says: "That the Professor of Moral Philosophy was a frequent guest at my grandmother's tea table, and fond of benignantly arguing with Miss Margaret, is evidence enough of the position she held in Edinburgh circles. The frank and cousinly relation went on without a thought on either side of closer ties until my father, at two or three and twenty, after various apprenticeships in London, was going finally to begin his career in his own business. By that time he had made up his mind that Margaret, though not in the least an ideal heroine to him, was quite the best sort of person he could have for a wife, the rather as they were already so well used to each other; and in a quiet, but resolute enough way, asked her if she were of the same mind, and would wait until he had an independence to offer her. His early tutress consented with frankly confessed joy. On these terms the engagement lasted nine years, at the end of which time, my grandfather's debts having all been paid and my father established in a business gradually increasing, the now not very young people were married in Perth one evening after supper, the servants of the house having no suspicion of the event until John and Margaret drove away together next morning to Edinburgh. In looking back to my past thoughts and ways, nothing astonishes me more than my want of curiosity about all these matters; and that, often and often as my mother used to tell with complacency the story of this carefully secret marriage, I never asked, 'But, mother, why so secret when it was just what all the friends of both of

you so long expected, and what all your best friends so heartily wished?' My reason for telling this in this place was chiefly to explain how my mother obtained her perfect skill in English reading, through the hard efforts which, through years of waiting, she made to efface the faults and supply the defects of her early education; effort which was aided and directed unerringly by her natural—for its intensity I might justly call it supernatural—purity of heart and conduct, leading her always to take most delight in the right and clear language which only can relate lovely things. Her unquestioning evangelical faith in the literal truth of the Bible placed me, as soon as I could perceive or think, in the presence of an unseen world, and set my active analytic power early to work on the questions of conscience, free will, and responsibility, which are easily determined in days of innocence, but are approached too often with prejudice, and always with disadvantage, after men become stupefied by the opinions or tainted by the sins of the outer world; while the gloom, and even terror, with which the restrictions of the Sunday, and the doctrines of the Pilgrim's Progress, the Holy War, and Quarles's Emblems oppressed the seventh part of my time was useful to me as the only form of vexation I was called on to endure, and redeemed by the otherwise uninterrupted cheerfulness and tranquillity of a household wherein the common ways were all pleasantness, and its single and strait path of perfect peace.

"Of our neighbors we saw nothing, with one exception. They were for the most part well-to-do London tradesmen of the better class, who had little sympathy with my mother's old-fashioned ways, and none with my father's romantic sentiment. The routine of my childish days became fixed, as of the sunrise and sunset to a nestling. It may seem singular to many of my readers that I remember with most pleasure the time when it was most regular and most solitary. Great part of my acute perception and deep feeling of the beauty of architecture and scenery abroad was owing to the well-formed habit of narrowing myself to happiness within the four brick walls of our 50-by-100 yards of garden, and accepting with resignation the æsthetic external surroundings of a London suburb, and yet more of a London chapel—an oblong, flat-ceiled barn, lighted by windows with semicircular heads, brick-arched, filled by small-paned glass held by iron bars, like fine-threaded halves of cobwebs, galleries propped on iron pipes up both sides, pews well shut in, each of them, by partitions of plain deal, and neatly brass-latched deal doors, filling the barn floor, all but its lateral, straw-matted passages; pulpit sublimely isolated, central from sides and clear of altar rails at end; a stout, four-legged box of well-grained wainscot, high as the level of the front galleries and decorated with a cushion of crimson velvet, padded 6 inches thick, with gold tassels at the corners, which was a great resource to me when I was tired of the sermon, because I liked watching the rich color of the folds and creases that came in it when the clergyman thumped it. Imagine the change between one Sunday and the next, from the morning service in this building attended by the families of the small shopkeepers of the Walworth Road in their Sunday trimmings; our plumber's wife, fat, good, sensible Mrs. Goad, sat in the pew next in front of us, sternly sensitive to the interruption of her devotion by our late arrivals—fancy the change from this to high mass in Rouen cathedral, its nave filled by the white-capped peasantry of half Normandy. Nor was the contrast less enchanting

or marvelous between the street architecture familiar to my eyes and that of Flanders and Italy. The reader may by effort, though still dimly, conceive the effect on my imagination of the fantastic gables of Ghent and orange-scented cortiles of Genoa. I can scarcely account to myself for the undimmed tranquillity of pleasure with which, after these infinite excitements of travel in foreign lands, my father would return to his desk opposite the brick wall of the brewery, and I to my niche behind the drawing-room chimney-piece. The sick thrill of pleasure through all the brain and heart with which, after even so much as a month or two of absence, I used to catch the first sight of the ridge of Herne Hill, and watch for every turn of the well-known road and every branch of the familiar trees, was, though not so deep or overwhelming, more intimately and vitally powerful than the brightest passions of joy in strange lands, or even in the unaccustomed scenery of my own. To my mother, her ordinary household cares, her reading with Mary and me, her chance of a chat with Mrs. Gray, and the unperturbed preparation for my father's return, and for the quiet evening, were more than all the splendors or wonders between poles and equators.

"I think it must have been early in 1832 that my father, noticing with great respect the conduct of all matters in the Fall family, wrote Mr. Fall a courteous request that 'the two boys' might pursue their holiday tasks together. Richard Fall was entirely good-humored, sensible, and practical, but had no particular tastes; a dislike, if anything, for my styles of art and poetry. He stiffly declined arbitration on the merits of my compositions: took rather the position of putting up with me than of pride in his privilege of acquaintance with a rising author. He was never unkind or sarcastic, but laughed me inexorably out of writing bad English for rhyme's sake or demonstrable nonsense either in prose or rhyme. We got gradually accustomed to be together, and far on into life were glad when any chance brought us together again.

"The year 1834 passed innocuously enough, but with little profit, in the quadripartite industries before described, followed for my own pleasure—with minglings of sapless effort in the classics, in which I neither felt nor foresaw the least good. Innocuously enough, I say—meaning with as little mischief as a well-intentioned boy, virtually masterless, could suffer from having all his own way, and daily confirming himself in the serious impression that his own way was always the best. I can not analyze the mixed good and evil in the third-rate literature which I preferred to the Latin classics. My volume of *The Forget-Me-Not*, which gave me that precious engraving of Verona (curiously also another by Prout, of St. Mark's in Venice), was somewhat above the general caste of annuals in its quality of letterpress, and contained three stories—*The Red-nosed Lieutenant*, by Rev. George Croly; *Hans in Kelder*, by the author of *Chronicles of London Bridge*; and *The Comet*, by Henry Neele, Esq.—which were in their several ways extremely impressive to me. The partly childish, partly dull, or even idiotic way I had of staring at the same things all day long carried itself out in reading, so that I could read the same things all the year round.

"I do not know when my father began to read Byron to me, all primary training, after the *Iliad*, having been in Scott; but it must have been about the beginning of the 'teen period, else I should recollect the first effect of it. Manfred, evidently, I had got at, like Macbeth, for the sake of the witches. Various questionable changes were made,

however, at that 1831 turning of twelve, in the hermitage discipline of Herne Hill. I was allowed to taste wine, taken to the theater, and on festive days even dined with my father and mother at four; and it was then, generally at dessert, that my father would read the *Noctes Ambrosianæ* regularly when they came out, and at last the shipwreck in *Don Juan*, of which, finding me highly appreciative, my father went on with nearly all the rest. By the end of 1834 I knew my Byron pretty well. After taking me at least six times straight through the Bible, my mother was not afraid of plain words to or for me; she had as much sympathy with all that is noble and beautiful in Byron as my father himself; her Puritanism was clear enough in common sense to see that, while Shakespeare and Burns lay open on the table all day, there was no reason for much mystery with Byron, though until later I was not allowed to read him for myself. I never got the slightest harm from Byron; what harm came to me was from the facts of life and from books of a baser kind, including a wide range of works of authors popularly considered extremely instructive—from Victor Hugo down to Doctor Watts. I said that my mother was an 'inoffensive prude.' She was herself as strict as Alice Bridgenorth, but she understood the doctrine of the religion she had learned, and without ostentatiously calling herself a miserable sinner, she knew that Madge Wildfire was no worse a sinner. She had sympathy with every passion as well as every virtue of true womanhood. There was a hearty, frank, and sometimes even irrepressible laugh in my mother. If, however, there was the least bitterness or irony in a jest, my mother did not like it; but my father and I liked it all the more, if it were just; and, so far as I could understand it, I rejoiced in all the sarcasm of *Don Juan*. Only two things I consciously recognized, that Byron's truth of observation was the most exact and his chosen expression the most concentrated that I had yet found in literature. By that time my father had himself put me through the first two books of Livy, and I knew, therefore, what close-set language was; but I saw then that Livy, as afterward Horace and Tacitus, was studiously, often laboriously, and sometimes obscurely concentrated, while Byron wrote as easily as a hawk flies and as clearly as a lake reflects the exact truth in the precisely narrowest terms; nor only the exact truth, but the most central and useful one. I saw then that both Byron and Turner were right in all things that I knew right from wrong in, and that they must thenceforth be my masters, each in his own domain.

"I had a sharp attack of pleurisy in 1835, and during the period of nursing and petting afterward I read *The Fair Maid of Perth*, learned the song of Poor Louise, feasted on Stanfield's drawing of *St. Michael's Mount* and Turner's *Santa Saba*, *Pool of Bethesda*, and *Corinth*, engraved in the Bible series. I got an immense quantity of useful learning out of those four plates. Moreover, I planned all my proceedings on my journey to Switzerland, which was to begin the moment I

was strong enough. I shaded in cobalt a cyanometer, to measure the blue of the sky with; bought a ruled notebook for geological observations, and a large quarto for architectural sketches, with a square rule and a foot rule ingeniously fastened outside, and I determined that the events and sentiments of this journey should be described in a poetic diary in the style of *Don Juan*, artfully combined with that of *Childe Harold*. Two cantos of this work were finished, carrying me across

RUSKIN'S EARLY HOME AT HERNE HILL.

France to Chamouni, where I broke down, finding that I had exhausted on the Jura all the descriptive terms at my disposal, and that none were left for the Alps.

"In this journey of 1835 I first saw Rouen and Venice—Pisa not till 1840. There have been three centers of my life's thought—Rouen, Geneva, Pisa. All that I did at Venice was by-work because her history had been falsely written before, and not even by any of her own people understood, and because in the world of painting Tintoret was virtually unseen, Veronese unfelt, Carpaccio not so much as named when I began to study them.

"My father's Spanish partner, Mr. Domecq, was living in 1835 in the *Champs Élysées* with his

English wife and his five daughters, the eldest on the eve of her marriage with one of Napoleon's officers and the four others, much younger, at home on vacation from a convent school. We had happy family dinner with them—played afterward 'la toilette de madame' with me, only I couldn't remember whether I was the necklace or the garters. Then Clotilde and Cécile played *Les Échos* and other fascinations of dance melody, only I couldn't dance. It puzzles me that I should have no recollection of my first opera, but I then heard four great musicians, all rightly to be called of genius, singing together, with sincere desire to assist each other, not eclipse, and to exhibit not only their own power of singing, but the beauty of the music they sang. Still more fortunately it happened that a woman of faultless genius led the dances—Taglioni; a person of the highest natural faculties and stainless, simple character, gathered with sincerest ardor and reverence into her art. Afterward a season did not pass without my hearing, twice or thrice at least, those four singers.

"Some little effort was made to pull me together in 1836 by sending me to hear Mr. Dale's lectures at King's College, where I explained to Mr. Dale, on meeting him one day in the court of entrance, that porticoes should not be carried on the top of arches. The lectures were on early English literature, of which, though I had never read a word of any before Pope, I thought myself already a much better judge than Mr. Dale. His quotation of 'Knut the king came sailing by' stayed with me, and I think that was about all I learned during the summer; for, as my adverse stars would have it, my father's partner, Mr. Domecq, asked if he might leave his daughters at Herne Hill. Clotilde, a graceful, oval-faced blonde of fifteen; Cécile, a dark, finely browed, beautifully featured girl of thirteen; Élise, fair, round-faced like an English girl, a treasure of good nature and good sense; Caroline, a delicately quaint little thing of eleven. Deeper than any one dreamed, the sight of them in the Champs Élysées had sealed itself in me, for they were the first well-bred and well-dressed girls I had ever spoken to. I was thrown, bound hand and foot, in my unaccomplished simplicity, into the fiery furnace or fiery cross of these four girls, who of course reduced me to a mere heap of white ashes in four days. Four days, at the most, it took to reduce me to ashes, but the *Mercrcdi des cendres* lasted four years. Anything more comic in the externals of it, anything more tragic in the essence, could not have been invented by the skillfullest designer in either kind. In my social behavior and mind I was a curious combination of Mr. Traddles, Mr. Toots, and Mr. Winkle. I had the real fidelity and single-mindedness of Mr. Traddles, with the conversational abilities of Mr. Toots, and the heroic ambition of Mr. Winkle—all these illuminated by imagination, like Mr. Copperfield at his first Norwood dinner. Clotilde (Adèle Clotilde in full, but her sisters called her Clotilde, after the queen saint, and I Adèle because it rhymed with shell, spell, and knell) was only made more resplendent by the circlet of her sisters' beauty, while my own shyness and unrepresentableness were further stiffened, or rather sanded, by a patriotic and Protestant conceit which was tempered neither by politeness nor sympathy; so that, while in company I sat jealously miserable like a stockfish (in truth, I imagine like nothing so much as a skate in an aquarium trying to get up the glass), on any blessed occasion of *tête-à-tête* I endeavored to entertain my Spanish-born, Paris-bred, and Catholic-hearted mistress with my own views upon the subject of the

Spanish Armada, the battle of Waterloo, and the doctrine of transubstantiation. I wrote with great pains a story about Naples (which I had never seen), and the Bandit Leoni, whom I represented as typical of what my own sanguinary and adventurous disposition would have been had I been brought up a bandit; and *The Maiden Giuletta*, in whom I portrayed all the perfections of my mistress. Our connection with Messrs. Smith & Elder enabled me to get this story printed in *Friendship's Offering*, and Adèle laughed over it in rippling ecstasies of derision, of which I bore the pain bravely for the sake of seeing her thoroughly amused. I dared not address any sonnets straight to herself, but when she went back to Paris wrote her a French letter seven quarto pages long, descriptive of the desolations and solitudes of Herne Hill since her departure. This letter, either Caroline or Élise wrote to tell me, she had really read and 'laughed immensely at the French of.' Bitterly ashamed of the figure I had made, but yet not a whit dashed back out of my daily swelling foam of furious conceit, supported as it was by real depth of feeling and by a true and glorious sense of the newly revealed miracle of human love in its exaltation of the physical beauty of the world, I set myself in my seventeenth year, in a state of majestic imbecility, to write a tragedy on a Venetian subject, in which the sorrows of my soul were to be enshrined in immortal verse.

"Out of my feebly luminous complaints to that luminary I was startled by a letter to my father from Christ Church College, advising him that there was room for my residence in the January term of 1837. Strangely enough, my father had never inquired into the nature or manner of matriculation till he took me up to display in Oxford. He never had any doubt about putting me at the most fashionable college, and of course my name had been down at Christ Church years before I was called up; but it had never dawned on my father's mind that there were two—fashionable and unfashionable—orders or castes at Christ Church, one of these being called gentlemen commoners and the other commoners. My father did not like the word 'commoner'—all the less because our relationships in general were not uncommon. I was entered as a gentleman commoner without further debate, and remember still, as if it were yesterday, the pride of first walking out of the Angel Hotel, and past University College, holding my father's arm, in my velvet cap and silk gown. Of course I never used a crib, but I believe the dean would rather I had used fifty than borne the puzzled and helpless aspect which I presented toward the afternoon over whatever I had to do. And as my Latin writing was, I suppose, the worst in the university, as I never by any chance knew a first from a second future, or even, to the end of my Oxford career, could get into my head where the *Pelasgi* lived, or where the *Heraclidæ* returned from, it may be imagined with what sort of countenance the dean gave me his first and second fingers to shake at our parting, or with what comfort I met the inquiries of my father and mother as to the extent to which I was, in college opinion, carrying all before me. As time went on, the aspect of my college hall to me meant little more than fear and shame of those examination days. I had been received as a good-humored and inoffensive little cur, contemptuously, yet kindly, among the dogs of race at the gentlemen commoners' table; and my tutor and the men who read in class with me were beginning to recognize that I had some little gift in reading

with good accent, thinking of what I read, and even asking troublesome questions about it, to the extent of being one day eagerly and admiringly congratulated by the whole class the moment we got into quad, on the consummate manner in which I had floored our tutor, I having no more intention to floor, or consciousness of having floored, than a babe unborn. A few weeks after coming up my tutor announced to me, with a look of approval, that I was to read my essay in hall on Saturday. I descended from the rostrum to receive, as I doubted not, the thanks of the gentleman commoners. Not in envy, but in fiery disdain, varied in expression through every form and manner of the English language, they explained to me that I had committed *lèse-majesté* against the order of gentleman commoners; that no gentleman commoner's essay ought ever to contain more than twelve lines, with four words in each; and that the impropriety of writing an essay with any meaning in it, like vulgar students, the thoughtlessness and audacity of reading one that would take at least a quarter of an hour, and then reading it all, might for this once be forgiven to such a greenhorn, but that Coventry wasn't the word for the place I should be sent to if I ever did such a thing again.

"I went back to Oxford in January, 1840, for the last push. The work had come by that time to high pressure, until twelve at night from six in the morning, with little exercise, no cheerfulness, and no sense of any use in what I read, to myself or anybody else. One evening a short, tickling cough surprised me, because preceded by a curious sensation in the throat, and followed by a curious taste in the mouth, which I presently perceived to be that of blood. My mother steadily maintained there was nothing serious the matter, and that I only wanted rest and fresh air. Sir James Clark cheerfully but decidedly ordered me abroad before autumn.

"I found my life again, all the best of it, and so the year 1842 dawned for me with many things in its morning cloud. I went up for my degree, but find no entry of it. I only went up for a pass, but still wrote Latin so badly that there was a chance of my not passing, but the examiners forgave it because the divinity, philosophy, and mathematics were all above the average, and they gave me a complimentary double fourth. What should I be or do? My utterly indulgent father was ready to let me do anything, with my room always luxuriously furnished in his house, my expenses paid if I chose to travel. I had not the least love of adventure, but liked to have comfortable rooms always ordered, and a three-course dinner ready by three o'clock. Although no coward under circumstances of accidental danger, I extremely objected to any vestige of danger as a continuous element in one's life. I would not go to India for fear of tigers, nor to Russia for fear of bears, nor to Peru for fear of earthquakes. This year I did not draw much; the things I now saw were beyond drawing; but I took to careful botany, while the month's time set apart for Chamouni was spent in merely finding out what was to be done, and where. We went home by the Rhine and Flanders.

"Perhaps my mother had sometimes admitted into her quiet soul the idea that it might be nice to have a larger garden. Sometimes a gold-tasseled Oxford friend would come out from Cavendish or Grosvenor Square to see me, and there was only the little back room opposite the nursery for him to wash his hands in. As his bank balance enlarged, even my father thought it possible that his country customers might be more

impressed by enjoying their after-dinner sherry with more room for their legs. And now that I was of age, and B. A., and so on, did not I also want a larger house? No; but ever since I could drive a spade I had wanted to dig a canal, and make locks on it, like Harry in Harry and Lucy. And in the field at the back of the Denmark Hill house, now, in this hour of all our weaknesses, I saw my way to a canal with any number of locks down toward Dulwich.

"At last the lease of the larger house was bought, and everybody said how wise and proper, and my mother did like arranging the rows of pots in the big greenhouse; and the view from the breakfast room into the field was really very lovely. And we bought three cows, and skimmed our own cream, and churned our own butter. And there was a stable and a farmyard and a haystack, and a pigsty, and a porter's lodge, where undesirable visitors could be turned back before startling us with their knock. But for all these things we never were so happy again—never more at home; and I never got my canal dug, after all!

"The next year there was traveling enough for us up and down the new garden walks. Also, the first volume of *Modern Painters* took the best of the winter's leisure. The house itself had no specialty, either of comfort or inconvenience; the breakfast room, opening on the lawn and farther afield, was extremely pretty when its walls were covered with lakes by Turner and doves by Hunt; the dining and drawing rooms were spacious enough for our grandest receptions—never more than twelve at dinner, with perhaps Henry Watson and his sisters in the evening—and had decoration enough in our Northcote portraits, Turner's *Slave Ship*, and, in later years, his *Rialto*, with our John Lewis and two Copley Fieldings, and every now and then a new Turner drawing. My own workroom, above the breakfast room, was only distinct as being such, in its large, oblong table, occupying so much of the fifteen by twenty-five feet of available space within bookcases that the rest of the floor virtually was only passage around it. I always wrote on the flat of the table, a bad habit, enforced partly by the frequent need of laying drawings or books of reference beside me.

"I had two distinct instincts to be satisfied, rather than ends in view, as I wrote day by day with higher kindled feeling the second volume of *Modern Painters*. The first, to explain to myself, and then demonstrate to others, the nature of that quality of beauty which I now saw to exist through all the happy conditions of living organisms, and down to the minutest detail and finished material structure naturally produced. The second, to explain and illustrate the power of two schools of art unknown to the British public, that of Angelico of Florence and Tintoret of Venice. I have no knowledge, and can form no conjecture, of the extent to which the book in either direction accomplished its purpose. It is usually read only for its pretty passages; its theory of beauty is scarcely ever noticed, its praise of Tintoret has never obtained the purchase of any good example of him for the National Gallery. But I permit myself—perhaps with vain complacency—the thought that I have had considerable share in the movement which led to the useful work of the Arundel Society in Italy, and to the enlargement of the National collection by its now valuable series of fourteenth century religious paintings. The style of the book was formed on a new model, given me by Osborne Gordon. I was old enough now to feel that

neither Johnsonian balance nor Byronic alliteration were ultimate virtues in English prose, and I had been reading with care, on Gordon's counsel, both for its arguments and its English, Richard Hooker's Ecclesiastical Polity. I had always a trick of imitating more or less the last book I had read with admiration. At all events, I did the best I then knew how, leaving no passage till I had put as much thought into it as it could be made to carry, and chosen the words with the utmost precision and tune I could give them."

Ruskin began his study of social conditions in Switzerland, and physical deformity from the "noon wind," which he came to realize as the distorter of trees, he believed to be associated with warped lives and dwarfed opportunities. He made many fruitless efforts to establish a center of beneficial influence. He writes: "Up to the year with which I am now concerned, 1849, when I was just thirty, no plans of this sort had dawned on me; but the journeying of the year, mostly alone, for the work necessary for the fourth volume of Modern Painters, gave me the melancholy knowledge of the agricultural condition of the great Alpine chain, which was the origin of the design for St. George's Guild, and virtually closed the days of youthful happiness and began my true work in the world—for what it is worth."

In the closing chapter of his autobiography Ruskin says: "In blaming myself, as often I have done, and may have occasion to do again, for my want of affection to other people, I must also express continually more and more wonder that ever anybody had any affection for me. I thought they might as well have got fond of a camera lucida or an ivory foot rule. All my faculty was merely in showing that such and such things were so; I was no orator, no actor, no painter but in a minute and generally invisible manner; and I couldn't bear being interrupted in anything I was about. Nevertheless, some sensible grown-up people did get to like me, the best of them with a protective feeling that I wanted guidance no less than sympathy, and the higher religious souls hoping to lead me to the golden gates."

When Ruskin turns his analytical powers upon his own nature, it makes profoundly interesting reading, although something in the dramatic but simple fashion of the telling makes one doubt whether he really conceived his own character more accurately than he did that of the world he afterward so savagely and so sorrowfully desired and failed to aid. He says: "The thoughtful reader must have noticed with some displeasure that I have scarcely, whether at college or at home, used the word 'friendship' with respect to any of my companions. The fact is, I am a little puzzled by the specialty and singularity of poetical and classic friendship. I get distinctively attached to places, to pictures, to dogs, cats, and girls, but I have had—Heaven be thanked!—many and true friends, young and old, who have been of boundless help and good to me—nor I quite helpless to them—yet for none of whom have I ever obeyed George Herbert's mandate: 'Thy friend put in thy bosom; wear his eyes still in thy heart, that he may see what's there; if cause require, thou art his sacrifice,' etc. Without thinking myself particularly wicked, I found nothing in my heart that seemed to me worth anybody's seeing; nor had I any curiosity for insight into those of others; nor had I any notion of being a sacrifice for them, or the least wish that they should exercise, for my good, any but the most

pleasurable accomplishments—Dawtrej Drewitt, for instance, being further endeared because he could stand on his head and catch vipers by the tail; Gershom Collingwood, because he could sing French songs about the Earthly Paradise; and Alic Wedderburn, because he could swim into tarns and fetch out water lilies for me like a water spaniel. And I never expected that they should care much for me, but only that they should read my books; and looking back, I believe they liked and like me nearly as well as if I hadn't written any. First, then, of this Love's Meinie of my own age, or under it, William McDonald took to me, and got me to promise to come to him at Crossmount, where it was his evangelical duty to do some shooting in due season. After once walking up Schehallien with him and his keepers, with such entertainment as I could find in the mewing and shrieking of some seventy or eighty gray hares who were brought down in bags and given to the poorer tenantry, and forming a final opinion that the poorer tenantry might better have been permitted to find the stock of their hare soup for themselves, I forswore further fashionable amusement, and set myself, when the days were fine, to the laborious eradication of a crop of thistles which had been too successfully grown by northern agriculture in one of the best bits of unboggy ground by the Tummel. The ambitions in practical gardening, of which the germs had been blighted in Herne Hill, nevertheless still prevailed over the contemplative philosophy in me so far as to rekindle the original instinct of liking to dig a hole whenever I got leave. Sometimes, in the kitchen garden of Denmark Hill, the hole became a useful furrow; but when once the potatoes and beans were set, I got no outlet nor inlet for my excavatory fancy or skill during the rest of the year. The thistle field at Crossmount was an inheritance of amethystine treasure to me; and the working hours in it are among the few in my life which I remember with entire serenity, as being certain I could have spent them no better. For I had wise—though I say it—thoughts in them, too many to set down here (they are scattered afterward up and down in Fors and Munera Pulveris), and wholesome sleep after them, in spite of the owls, who were many in the clumps of pine by Tummel shore. On the Cumberland and Swiss lakes, and within and without the Lido, I had learned to manage a boat—an extremely different thing from steering one in a race—and the little two-foot steps of Tummel were, for scientific purposes, as good as falls twenty or two hundred feet high. I found that I could put the stern of my boat full six inches into the air over the top of one of these little falls, and hold it there, with very short sculls, against the level stream, with perfect ease for any time I liked, and any child of ten years old may do the same. Half my power of ascertaining facts of any kind connected with the arts is in my stern habit of doing the thing with my own hands till I know its difficulty, and though I have no time nor wish to acquire showy skill in anything, I make myself clear as to what the skill means and is. Thus, when I had to direct roadmaking at Oxford, I sate myself with an iron-masked stonebreaker on his heap to break stones beside the London road till I knew how to advise my too impetuous pupils to effect their purposes in that matter, instead of breaking the heads of their hammers off (a serious item in our daily expenses). I learned from an Irish street-crossing sweeper what he could teach me of sweeping, but found myself in that matter nearly his match; and again and

again I swept bits of St. Giles's foot pavements, showing my corps of subordinates how to finish into depths of gutter. I worked with a carpenter until I could make an even shaving six feet long off a board, and painted enough with properly and delightfully sloppy green paint to feel the master's superiority in the use of a blunt brush. But among all these and other such student-ships the instrument I finally decided to be the most difficult to manage was the trowel. For accumulated months of my boy life I watched bricklaying and paving, but when I took the trowel into my own hand I abandoned at once all hope of the least real skill with it unless I gave up all thoughts of any future literary or political career. But quite the happiest bit of manual labor I ever did was for my mother in the old inn at Sixt, where she alleged the stone staircase to have become unpleasantly dirty since the last year. Nobody in the inn appearing to think it possible to wash it, I brought the buckets of water from the yard myself, poured them into a beautiful image of Versailles waterworks down the fifteen or twenty steps of the great staircase, and with the strongest broom I could find cleaned every step into its corners. It was quite lovely work to dash the water and drive the mud from each with accumulating splash down the next one.

"The admiration of tree branches at Fontainebleau led me into careful discernment of their species; and while my father, as was his custom, read to my mother and me for half an hour after breakfast, I always had a fresh-gathered outer spray of a tree before me, of which the mode of growth, with a single leaf full size, had to be done at that sitting in fine pen outline, filled with the simple color of the leaf at one wash. On fine days, when the grass was dry, I used to lie down on it and draw the blades as they grew, with the ground herbage of buttercup or hawkweed mixed among them, until every square foot of meadow or mossy bank became an infinite picture and possession to me, and the grace and adjustment to each other of growing leaves a subject of more curious interest to me than the composition of any painter's masterpiece. The love of complexity and quantity influencing my preference of flamboyant to pure architecture was here satisfied without qualifying sense of wasted labor by what I felt to be the constant working of Omnipotent kindness in the fabric of the food-giving tissues of the earth; nor less, morning after morning, did I rejoice in the traceries and the painted gloss of the sky at sunrise.

"This physical study had advanced since 1842, when it began, until in 1847 it had proceeded into botanical detail, and the collection of material for Proserpina began with the analysis of a thistle top, as the foundation of all my political economy was dug down to, through the thistle field of Crossmount. Analysis of thistle top, I say, not dissection nor microscopic poring into. Flowers, like everything else that is lovely in the visible world, are only to be seen rightly with the eyes which the God who made them gave us, and neither with microscopes nor spectacles. These have their uses for the curious and the aged. But in health of mind and body men should see with their own eyes, hear and speak without trumpets, walk on their feet, not on wheels, and work and war with their arms, not with engine beams nor rifles warranted to kill twenty men at a shot before you can see them. And far more difficult work than this was on foot in other directions. Too sorrowfully it had now become plain to me that neither George Herbert, nor Richard Hooker, nor Henry Melvill, nor Thomas Dale, nor the Dean of

Christ Church, nor the Bishop of Oxford could in any wise explain to me what Turner meant by the contest of Apollo with the python or by the repose of the great dragon above the garden of the Hesperides. For such nearer python as might wreath itself against my own now gathering strength, for such serpent of eternity as might reveal its awe to me amid the sands even of Forest Hill or Addington Heath, I was yet wholly unprepared."

Has the great analyst laid bare in these few pages the secret of his lamentable failure in the world of men and of the social forces? He mistook the former for dwarfed and distorted physical creations. He "saw men as trees walking," and he mistook the great plantation of society for a field of thistles and a meadow or woodland, where the uprooting was to be ruthless and the blendings of light and color given full play in heaven's own atmosphere. He forgot that no amount of patient study could show him the "noon wind" from the great mountain chains of the spiritual world; that the minglings of mental and moral powers were as much hidden from human searching as is the growth of a flower from the peeping and probing student of stem and root. The most sorrowful part of it was that right there, where he felt called of God to apply all his powers to the good of men whom God had made, he threw away all the noble lessons he had learned and taught so well to others, and forgot his long patience and its results. He spent years over the same few pages of literature, months studying a single group of stone, a sand heap, a square inch of foliage—with ear close to the ground, with eye aflame with acute and beloved attention; and when he came to write for, to speak to, to build and plan and work for men, he made no study of that world of humanity from which his own had been shut out as if by monastery walls. Where he had bidden the world take nothing in Nature for granted, but turn a patient and devout eye and ear to watch and listen through silence and through storm, he now bade it, with scorn, bitterness, and an agony of impatience, heed only his teaching and his practical methods of transforming society. The mental, moral, and physical freedom he had insisted upon for himself, often at the cost of the love or sympathy of his fellows, he imperiously denied to others. The science of fitting things to their own places through faithfully learning how they had come into such relations, he threw contempt upon by his unscientific methods of using his influence and his wealth. He had learned to break stones from humble stonebreakers, but he came to threaten to break the heads of those who did not desire to break stones as he did. Ruskin presents the most striking instance of the need of the world for patriots and lovers, not reformers; of builders, not iconoclasts.

Ruskin's life and work stand as a beacon light of welcome and of warning. His sincerity, his purity, his devotion to duty, his fine ideals, and his noble contributions to literature and art will live in memory while English life endures; but his misconceived, clumsy, bigoted, and conceited attempt to snatch the Maker's trowel out of his hand and to shape bricks without straw and walls without cement or alignment will serve as a warning to some wiser generation than the ones that have witnessed the attempt and are even now trying in puny ways to establish the earth on new and insecure foundations. If his readers will learn from Ruskin that "in health of mind and body men should see with their own eyes, hear and speak without trumpets, walk on their own feet, and work and war with their own arms," there

will be fewer attempts to establish philanthropic hospitals. If they will remember that "a flower is to be watched as it grows, in its association with the earth, the air, and the dew; its leaves are to be seen as they expand in the sunshine; its colors as they embroider the field or illumine the forest," there will be fewer efforts to transplant earth's children to social hotbeds. This is the present problem, and if Ruskin's fidelity and faith remain and overbalance his passionate unwisdom in their application, it will be well for the thousands to whom his prolific brain has spoken.

Here let Ruskin present his own explanation and apology. He says, in *Præterita*: "Often in my other books, and now once for all and finally here, I have to pray my readers to note that this continually increasing arrogance was not founded on vanity in me, but on sorrow. There is a vast difference, there is all the difference, between the vanity of displaying one's own faculties and the grief that other people do not use their own. Vanity would have led me to continue writing and drawing what every one praised, and disciplining my own already practiced hands into finer dexterities. But I had no thought but of learning more and teaching what truth I knew, assuredly then and ever since, for the student's sake, not my own fame's."

A notable instance of the strange inconsistencies of perception and emotion which characterized Ruskin's mind is seen in his essay on War, in the volume entitled *The Crown of Wild Olive*. In the opening paragraphs he says: "All the pure and noble arts of peace are founded on war; no great art ever yet rose on earth but among a nation of soldiers." After quoting Egypt and Greece as evidences of the truth of his statement, he says: "You are to remember, in passing to the next phase of history, that though you must have war to produce art, you must also have much more than war, namely, an art instinct or genius in the people; and that, though all the talent for painting in the world won't make painters of you unless you have the gift for fighting as well, you may have the gift for fighting and none for painting. 'It may be so,' I can suppose that a philanthropist might exclaim. 'Perish then the arts, if they can flourish only at such a cost. What worth is there in toys of canvas and stone if compared to the joy and peace of artless domestic life?' And the answer is: Truly, in themselves, none. But as expressions of the highest state of the human spirit their worth is infinite. As results they may be worthless, but as signs they are above price. For it is an assured fact that, whenever the faculties of men are at their fullness, they must express themselves in art; and to say that a state is without such an expression is to say that it is sunk from its proper level of manly nature. So that, when I tell you that war is the foundation of all the arts, I mean also that it is the foundation of all the high virtues and faculties of men. It was very strange to me to discover this, and very dreadful, but I saw it to be quite an undeniable fact. The common notion that peace and the virtues of civil life flourished together I found to be wholly untenable. Peace and the vices of life only flourish together. We talk of peace and learning and of peace and plenty and of peace and civilization, but I found that those were not the words which the Muse of History coupled together; that on her lips the words were—peace and sensuality, peace and selfishness, peace and corruption, peace and death. I found, in brief, that all great nations learned their truth of word and strength of thought in war; that they were nourished in war and wasted by peace, taught by war and deceived

by peace, trained by war and betrayed by peace—in a word, that they were born in war and expired in peace. Yet now note carefully, in the second place, it is not *all* war of which this can be said. It is not the ravage of a barbarian wolf flock nor the habitual restlessness and rapine of mountaineers, as on the old borders of Scotland; nor the occasional struggle of a strong, peaceful nation for its life, as in the wars of the Swiss with Austria; nor the contest of merely ambitious nations for extent of power, as in the wars of France under Napoleon or the just terminated war in America [the civil war in the United States]. None of these forms of war build anything but tombs. But the creative and foundational war is that in which the natural instincts of self-defense are sanctified by the nobleness of the institutions and purity of the households which they are appointed to defend. To such war as this all men are born; in such war as this any man may happily die; and forth from such war as this have arisen throughout the extent of past ages all the highest sanctities and virtues of humanity."

Ruskin was addressing the men of the Royal Military Academy at Woolwich. In closing, after pleading with them to live clean and manly lives, and after apostrophizing the mothers, wives, and lovers of these men, he says: "But truly, if it might be, I, for one, would fain join in the cadence of hammer strokes that should beat swords into plowshares; and that this can not be is not the fault of us men. It is *your* fault, wholly yours. Only by your command or by your permission can any contest take place among us. And the real, final reason for all the poverty, misery, and rage of battle throughout Europe is simply that you women, however good, however religious, however self-sacrificing for those you love, are too selfish and too thoughtless to take pains for any creature out of your own immediate circles. You fancy that you are sorry for the pains of others. Now I just tell you this, that if the usual course of war, instead of unroofing peasants' houses and ravaging peasants' fields, merely broke china upon your own drawing-room tables, no war in civilized countries would last a week. I tell you more, that at whatever moment you choose to put a period to war you could do it with less trouble than you take any day to go out to dinner. You know, or at least you might know if you would think, that every battle you hear of has made many widows and orphans. We have none of us, truly, heart enough to mourn with these. But at least we might put on the outer symbols of mourning with them. Let but every Christian lady who has conscience toward God vow that she will mourn, at least outwardly, for his killed creatures. Your praying is useless and your churchgoing mere mockery of God if you have not plain obedience in you enough for this. Let every lady in the upper classes of civilized Europe simply vow that while any cruel war proceeds she will wear black, a mute's black, with no jewel, no ornament, no excuse for or evasion into prettiness—I tell you again, no war would last a week. And, lastly, you women of England are all now shrieking with one voice—you and your clergymen together—because you hear of your Bibles being attacked. If you choose to obey your Bibles, you will never care who attacks them. It is just because you never fulfill a single downright precept of the Book that you are so careful for its credit, and just because you don't care to obey its whole words that you are so particular about the letters of them. The Bible tells you to dress plainly, and you are mad for finery; the Bible tells you to have pity on the poor, and you

crush them under your carriage wheels; the Bible tells you to do judgment and justice, and you do not know, nor care to know, so much as what the Bible word 'justice' means. Do but learn so much of God's truth as that comes to; know what he means when he tells you to be just; and teach your sons that their bravery is but a fool's boast, and their deeds but a firebrand's tossing, unless they are indeed just men and perfect in the fear of God, and you will soon have no more war unless it be such as is willed by him of whom, though Prince of Peace, it is also written, 'In righteousness he doth judge and maketh war.'

This passage gives the key to much of Ruskin's failure to act harmoniously with his fellow-men. Clear and just of vision when his eye was fixed on a distant and pure ideal, he was purblind and cross-eyed when gazing upon the every-day scenes of life about him. He walked with a free stride on alpine heights that dizzied the brains of common mortals, but fell sprawling in a muddy pool for lack of ability to turn gracefully into the path that skirts it. Even Ruskin's iron will and true desire and financial power could not make a home for workmen where their heart had laid no gift on the altar. A sacred fire will not glow to order.

He discerned and pointed out the fact that warfare in a noble cause is humanity's effort to lay upon the altar of sacrifice the noblest gifts; and that as such it advances the cause of true and lasting peace infinitely more than can a supine and meretricious truce with evil. He recognized the power of woman's influence, and then he poured forth commonplace and ridiculous denunciation against all war and against womankind as its sole instigator and abettor. And the remedy he proposed was as absurd as his opinions. The present confusion of thought on this subject of war and woman's responsibility concerning it are perhaps partly due to the errors of this magnetic writer and speaker.

In 1839 Ruskin gained the Newdigate prize for English poetry, at Oxford, by a poem entitled *Salsette and Elephanta*. He was graduated in 1842. He studied painting under Copley Fielding and Harding, but he says himself that his real masters were Rubens and Rembrandt. The first volume of his *Modern Painters* appeared in 1843. He says it was called forth by a desire to reply to a criticism of Turner's works which appeared in *Blackwood's Magazine*. His purpose was to show the superiority of Turner to all the modern landscape painters, and to show, as well, the superiority of modern landscape painters to the old masters in that branch of art. He spared no reputation that seemed to him undeserved, and condemned old and new alike with such severity that he created bitter animosity. But so transcendent was the beauty of his style, and so original and sincere the criticism, that he held the public and began to have great weight in swaying opinion. In 1846 he republished the volume in a greatly altered form. Three other volumes on the *Modern Painters* appeared later; the fifth and last was not published until 1860. The whole work had then become an extended discussion of the principles of art, an artistic and symbolical treatment of natural scenery and life, imaginative and poetic descriptions illustrated with drawings from his own hand. A revised and altered edition of the whole work appeared in 1860-'67, and another in 1873, and an edition in 6 volumes, with some additional plates, an epilogue, and a new index, in 1880. In 1849 he published *The Seven Lamps of Architecture*, and in 1851-'53 *The Stones of Venice*. Both were exquisitely illustrated by himself, and they were designed to

present lofty and beautiful ideals of domestic architecture.

Preraphaelitism meantime had begun to assume the form of a distinct phase or school of art in England, and Ruskin espoused its cause with his usual ardor. He wrote notes, pamphlets, and letters on the Academy Exhibition from 1855 to 1860. Indeed, Ruskin may be said to have made a cult of what was merely an opinion. He defined the underlying principle of preraphaelitism to be the determination "to paint things as they probably did look and happen, not as, by rules of art developed under Raphael, they might be supposed gracefully, deliciously, or sublimely to have happened." In 1854 Ruskin published *Lectures on Architecture and Painting and The Two Paths*, these being lectures on art and its application to decoration and manufacture. In 1857 appeared *The Elements of Drawing*, and in 1859 *The Elements of Perspective*. Among his other books on art are *Aratra Pentelici*, on the principles of sculpture; *The Laws of Fesolá*, the elements of painting and drawing; *Frondes Agrestes*, which is made up of readings from *Modern Painters*; *Giotto and his Works*; *Val d'Arno*, lectures on the art of the thirteenth century in Pisa and Florence; *Pleasures of England*, containing lectures on the modern art of England and the history of England; *Mornings in Florence*, studies of Christian art for English travelers; and *St. Mark's Rest*, on the history of Venice. Kindred to the books on art were the books on the studies of Nature made while Ruskin was studying and welding his art material. These include *Ethics of the Dust*, lectures on crystallization; *Ariadne Florentina*, lectures on wood engraving; *Love's Meinie*, on birds; *Deucalion*, studies of the lapse of waves and life of stars; *The Eagle's Nest*, which directly discusses the relation of natural science to art; and *Proserpina*, studies of wayside flowers. Of other general writing, striking instances are seen in *Notes on the Construction of Sheepfolds*, which deals with church discipline; *The Queen of the Air*, a study of the Greek myths of cloud and storm; *Sesame and Lilies*, two lectures on the education of men and women; *The King of the Golden River*, a fairy story with a moral and a study of Nature.

This series of works presents one side of Ruskin's nature, or rather one phase of his life work, for, in reality, all his work is one, though from the subjects treated and the methods of working them out they appeared to be at war with one another or to have no relation. Such as they are, they belong together. Side by side with the art and Nature study and literature is the life-long picturing of and experiment with politico-social conditions. While actively engaged, after studying painting and architecture abroad, in writing at home from the gathered material, Ruskin for several years taught drawing at the *Workingmen's College*, and began to lecture to workingmen. He became widely popular in the latter field, and delivered courses of lectures, which were freely and lovingly given, at *South Kensington Museum*, *Manchester*, *Bradford*, to members of the *Architectural Association* in *Lyon's Inn Hall*, and at *Tunbridge Wells*. His *Two Paths* was meant to teach the dependence of all noble design on organic form, and the divergence of the two paths of study—the conventional or dead, and the organic or living, in art. He said his writings on art had not been matters of choice, as it had always seemed to him he might have done more good in other ways, but of necessity. He believed he saw injustice done, and

heard falsehood taught; he must needs try to remedy the one, and was compelled to deny the other. He believed his work to have grown to its natural shape and size in his social writing and effort. He says: "Of that tree, if any fruit grow such as you like, you are welcome to gather it without thanks; and so far as it is poor or bitter, it will be some justice to refuse it without reviling." The rhetoric is charming, but the truth is that those who would have been glad to gather such good as they could make use of had their heads broken because they did not gather and use it all just as it was shaken or flung at them; and if denunciation is reviling, then those who refused it all received a portion with the wicked. During the years from 1860 to 1870 Ruskin's interest in social matters encroached more and more upon his art life and work, and finally overwhelmed it utterly. In 1857 he had proclaimed the power over him of Thomas Carlyle, "my master," as he always called him, and the influence of the great cynic and dogmatist is but too painfully evident upon the naturally sweet and tender and truly Christian character of Ruskin. What the rude thought and uncouth literary style of Carlyle could not do in pressing home his opinions upon his countrymen, that Ruskin tried to do for him with inimitable grace. Detestation of the world as it is was the prominent feeling with both writers, but one hated while he detested, and the other loved.

Ruskin's Manchester lectures first revealed him as a political economist of a novel type. In these lectures he treats of the duties of the nation in relation to art and artistic genius—the discovery, application, accumulation, and distribution of them. Here may be found the germs of nearly all his later work in this direction. The topics dealt with were co-operation, contentment, legislation, expenditure, entertainment, the authority of the Bible, thanksgiving, demoniacal influence, dictatorship, and the necessity of law; the proper offices of bishop and overseer, and duke or leader; essential laws against theft by false work or bankruptcy, and by unjust profits; education and its relations to position in life; the evil effects of servile employments and excessive and improper work; improvidence in marriage; the dignity of the fine arts; the duties of the upper classes; the just tenure of land; the office of the soldier; inevitable distinctions of rank; and necessary submission to authority. In 1862 some of the teachings of these lectures had been expanded in *Unto this Last*. *Time and Tide by Wear and Tyne*, which contained 25 letters to a workman in Sunderland, appeared in 1867. Its general theme was the nature of the laws bearing on honesty in work and exchange. "I tell you this," "You may take this for granted," "I know," "Believe me," he reiterated in all these letters, with delightful obliviousness of the fact that one, or ten, or twenty years before he had been equally positive that exactly the contrary of many of his statements was true.

In 1871 Ruskin began the publication of a periodical, issued monthly, called *Fors Clavigera*. This he kept up until he was overtaken by serious illness, caused by overwork, while writing the number for March, 1878. He resumed them after his recovery. He explains that the title, *Fors Clavigera*, meant "the fate which bears the club, the key, or the nail," the overpower, the guiding or the compelling forces of human life. In the opening article he says: "Consider the ridiculousness of the division of parties into Liberal and Conservative. There is no opposition whatever

between those two kinds of men. There is opposition between Liberals and Illiberals—that is to say, between people who desire liberty and who dislike it. I am a violent Illiberal, but it does not follow that I am a Conservative. A Conservative is a person who wishes to keep things as they are; and he is opposed to a destructive, who wishes to destroy them, or to an innovator, who wishes to alter them. Now, though I am an Illiberal, there are many things I should like to destroy. I should like to destroy most of the railroads of England, and all the railroads in Wales. I should like to destroy and rebuild the Houses of Parliament, the National Gallery, and the East End of London; and to destroy, without rebuilding, the new town of Edinburgh, north suburb of Geneva, and the city of New York. Thus in many things I am the reverse of conservative; nay, there are some long-established things which I hope to see changed before I die; but I want still to keep the fields of England green, and her cheeks red; and that girls should be taught to courtesy and boys to take their hats off when a professor or other dignified person passes by; and that kings should keep their crowns on their heads, and bishops their crosiers in their hands, and should duly recognize the significance of the crown and the use of the crook."

Near the close of the fifth number of the periodical he wrote: "There are three material things, not only useful but essential to life. No one 'knows how to live' till he has got them. These are pure air, water, and earth. There are three immaterial things not only useful but essential to life. No one knows how to live until he has got them also. These are admiration, hope, and love. These are the six chiefly useful things to be got by political economy when it has become a science. I will briefly tell you what modern political economy—the great '*savoir mourir*'—is doing with them. Heaven gives you the main elements of the first three. You can destroy them at your pleasure, or increase, almost without limit, the available quantities of them. You can vitiate the air by your manner of life, and of death, to any extent. You might easily vitiate it so as to bring such a pestilence on the globe as would end all of you. You or your fellows, German and French, are at present busy vitiating it to the best of your power in every direction, chiefly at this moment with corpses, and animal and vegetable ruin in war; changing men, horses, and garden stuff into noxious gas. But everywhere, and all day long, you are vitiating it with foul chemical exhalations; and the horrible nests which you call towns are little more than laboratories for the distillation into heaven of venomous smokes and smells, mixed with effluvia from decaying animal matter, and infectious miasmata from purulent disease. On the other hand, your power of purifying the air, by dealing properly and swiftly with all substances in corruption, by absolutely forbidding noxious manufactures, and by planting in all soils the trees which invigorate earth and atmosphere, is literally infinite. You might make every breath of air you draw food." And so on, through the category of changes that suggest a new heaven and a new earth. In closing, he laid out, in few words, the plan he would pursue in helping to found them both. He says: "The tenth of whatever is left to me I will make over to you in perpetuity, with engagement to add the tithe of whatever I earn afterward. Who else will help, with little or much? the object of such fund being to begin, gradually, no matter how slowly, to increase the buying and securing

of land in England, which shall not be built upon, but cultivated by Englishmen with their own hands and such help of force as they can find in wind and wave. If any come to help me, it is to be on the following conditions: We will try to make some small piece of English ground beautiful, peaceful, and fruitful. We will have no steam engines upon it, and no railroads; we will have no untended or unthought-of creatures on it: none wretched but the sick; none idle but the dead. We will have no liberty upon it, but instant obedience to known law and appointed persons; no equality upon it, but recognition of every betterness we can find, and reprobation of every worseness. When we want to go anywhere we will go there quietly and safely, not at forty miles an hour in the risk of our lives; when we want to carry anything anywhere, we will carry it either on the backs of beasts, or on our own, or in carts, or boats; we will have plenty of flowers and vegetables in our gardens, plenty of corn and grass in our fields, and few bricks."

From 1869 till 1879 Ruskin was Slade Professor of Art at Oxford. His superintendence of the practical work of art teaching was close and unwearied until it was terminated by his long and dangerous illness—a complete breaking down of his nervous strength. On his recovery he was reappointed and returned to the thankless post in 1883. He found large and increasing audiences, and was compelled to hold his lectures in the theater of the museum. This was crowded to the doors twice a week, and he was obliged to repeat each lecture. Graduates, undergraduates, and numbers of ladies attended. It might have been said of these lectures as Lowell said of Emerson's: "It was chaos come again, but it was a chaos full of shooting stars, of creative forces." No one who heard Ruskin could tell what the lectures were about from their titles, and hardly from their subject-matter, so disjointed were they and mingled of fanciful ethics and more fanciful theology, violent criticism on art and letters and life, all given with the marvelous beauty of diction and flood of emotion that never failed to astonish and move the hearer. But at last all this became too strange to be endured by those who cared most for Ruskin's reputation, and he was persuaded to resign the chair for a second time. In doing so he sent a characteristic letter to the vice-chancellor, in which he said that his reasons were that the university would not buy Turner's *The Crook of Lune*, and that by a recent vote it had sanctioned vivisection. As to the former, it may be said, in passing, that the university could not get its rents and had not paid its debts, so that £1,200 for a Turner was not forthcoming.

Ruskin had endowed munificently, from his own fortune, a mastership for the art school, and given it a series of valuable educational drawings. He did the same thing for the FitzWilliam Museum in Cambridge. His gifts to every object that seemed to him worthy were generous and frequent. He had inherited £175,000, and he died comparatively poor. St. George's Guild, which was founded as the result of the appeals in *Fors Clavigera*, was intended to be a return to primitive agricultural life where the old simple virtues should be instilled and insisted upon; where the old and homely methods of hand work should do all that was required, without aid from any modern machine or manufacture.

In the later numbers of *Fors Clavigera* Ruskin used to publish the accounts of his own private income and expenditure and of the Order or Company of St. George, which he had endowed, and

for which he was constantly appealing to his countrymen for sympathy and support. The object of the association was to promote good and honest work. The vows taken, founded on belief in the goodness of God and the dignity of human nature, inculcated honor, honesty, industry, frugality, gentleness, and obedience. As the hopelessness of this struggle against the world as it is, and mankind in its daily need and real desire, was gradually borne in upon a mind that was blind to the causes of its failure, Ruskin became more bitter in his detestation of the art and manners; trade and commerce, impulse and movement, that he saw about him. He was again prostrated by severe illness, and again his wonderful constitution triumphed over disease, and he was spared to write one of the most delightful of all his books—*Præterita*—which pictures his true inner self in its modesty and gentleness and faith. Ruskin's sad marriage and unmarried life with the beautiful woman who afterward became the wife of John Everett Millais, the painter, is a story that he omits to tell, and that need only be referred to here.

Ruskin has not said the final word concerning art, even if he has said many that stand as final truth; he certainly has not said a final word as to social conditions in an age and world of steamships and railways, cities and manufactures, although he has presented noble ideals of thought for those who can grasp real conditions; but as a master of written language his place seems to be assured. His last volume is not his least beautiful one, and the charm of his character is more apparent because the friction was a thing of the past, and faithful friends made the decline of life pleasant to his sensitive spirit. The Ruskin Society, London, was founded in 1881; the Ruskin Reading Guild, in 1887. The Society publishes a quarterly magazine called *Igdrasil*, a title as strange and noncommittal as are most of Ruskin's own. He was D. C. L. of Oxford, and an honorary student of Christ Church College. In 1871 the degree of LL. D. was given to him by Cambridge. He founded a museum at Walkley, which was transferred to Sheffield in 1890. Here he placed part of his priceless library and treasures of art. He made his home in Brantwood, Coniston, in the lake country, where he died, and where, in accordance with his wish, he was buried. This paragraph, written at Coniston in one of his periods of illness, was happily unfulfilled, for love of moorland and wood and sleeping village did serve him to the last, while friendship gave what love had long withheld:

"Morning breaks, as I write, along those Coniston fells, and the level mists, motionless and gray beneath the rose of the moorlands, veil the lower woods and the sleeping village and the long lawns by the lake shore. Oh, that some one had but told me in my youth, when all my heart seemed to be set on these colors and clouds, that appear for a little while and then vanish away, how little my love of them would serve me when the silence of lawn and wood in the dews of morning should be completed; and all my thoughts should be of those whom, by neither, I was to meet more."

RUSSIA, an empire in northern Europe and Asia. The throne is hereditary in the dynasty of Romanoff-Holstein-Gottorp. The system of government is an absolute monarchy in which the legislative, executive, and judicial powers are united in the Emperor, or Czar, who is assisted by a Cabinet of Ministers, each of whom has charge of an executive department; by a Council of State, which examines and passes upon projects

of law submitted by the ministers; by a Ruling Senate, which watches over the general administration and superintends the judiciary; and by a Holy Synod, which directs ecclesiastical affairs. The Czar is the head of the Russian Church, which in its doctrines and ritual is identical with the Orthodox Greek, maintaining the relation of a sister Church with the patriarchates of Constantinople, Jerusalem, Antioch, and Alexandria.

The reigning Emperor of All the Russias is Nicholas II, born May 18, 1868, who succeeded his father, Alexander III, on Nov. 1, 1894; married, Nov. 26, 1894, to Alexandria, daughter of Ludwig IV, Grand Duke of Hesse. The heir presumptive is the Grand-Duke George, brother of the Czar, born May 9, 1871. The Committee of Ministers at the beginning of 1900 was as follows: Minister of the Imperial House and Imperial Domains, Gen. W. Freederiksz, appointed in 1898; Assistant Minister of Foreign Affairs, Count Muraviev, appointed in 1897; Procurator General of the Holy Synod, K. P. Pobedonosteff; Minister of the Interior, M. Sipyagin, appointed in November, 1899; Minister of Public Instruction, M. Bogolepoff, appointed in 1898; Minister of War, Gen. Kurupatkin, appointed in 1898; Minister of Marine, Vice-Admiral Tyrtoff; Minister of Agriculture and State Domains, A. S. Yermoloff; Minister of Justice, N. V. Muraviev; Minister of Finance, S. J. Witte; Minister of Railroads and Communications, Prince Hilko; Comptroller General, Gen. Lobko, appointed in November, 1899; Minister and Secretary of State for Finland, W. K. de Plehwe. The Grand-Dukes Vladimir, Alexis, and Michael are members of the Committee of Ministers, the president of which is J. N. Durnovo. After the sudden death of Count Muraviev, Count Lamsdorff was appointed on Aug. 7, 1900, director of the Russian Ministry of Foreign Affairs.

Area and Population.—The area in square miles and the population of the divisions of the empire are given in the following table:

DIVISIONS.	Area.	Population.
European Russia	1,902,302	94,215,415
Poland	49,159	9,455,943
Finland	144,255	2,488,249
Caucasus	86,661	3,732,556
Transcaucasia	94,189	5,516,139
Steppes	908,073	3,451,365
Turkestan	257,134	3,898,076
Transcaspien	314,237	372,198
Western Siberia	870,818	3,367,576
Eastern Siberia	3,044,513	1,992,221
Amur region	888,630	339,127
Sakhalin	29,396	28,166
Caspian Sea	160,381
Russians in navy, etc.	42,900
Total	8,660,395	128,932,173

The density of population is 193 to the square mile in Poland, 51 in Russia proper, 64 in Transcaucasia, 43 in northern Caucasia, 20 in Finland, 15 in Turkestan, 4 on the steppes, 4 in western Siberia, 2 in the Transcaspien territory, 1 in Sakhalin, 0.7 in eastern Siberia, and 0.3 in the Amur territory. In Russia proper there are 102.8 women to 100 men; in Poland, 98.6; in Finland, 102.2; in the Caucasus, 89.5; in Siberia, 93.7; on the steppes, 89.4; in the Transcaspien territory and Turkestan, 83; in the whole empire, 99.8. The immigration of Russians, including Jews, into the United States from 1873 to 1897 inclusive was 722,472. In the seven years from 1891 to 1897 it was 292,032 from Russia proper, 91,994 from Russian Poland, and 24,977 from Finland. The emigration from Russia in Europe to Siberia has grown from 26,000 in 1888 to about 150,000

a year. In 1896 the net immigration of foreigners into the Russian Empire was 47,701, and in 1897 it was 79,343; the net emigration of Russians was 75,118 in 1896 and 86,875 in 1897.

The Government appropriations for education in 1899 amounted to 51,062,842 rubles, of which 4,108,045 rubles were for universities and 9,390,055 rubles for intermediate schools. The universities are St. Petersburg, with 2,634 students; Moscow, with 3,693; Kazan, with 781; Kharkoff, with 1,059; Odessa, with 492; Kieff, with 2,558; Warsaw, with 1,085; Yuriev, with 1,326; and Tomsk, with 477. There are 177 gymnasias, with 51,582 pupils; 58 progymnasias, with 6,510; 104 real-schulen, with 24,279; 67 normal schools, with 6,334; 159 girls' gymnasias, with 44,795; 174 girls' progymnasias, with 22,767; 9 girls' middle schools, with 432; 4 girls' normal schools, with 366; 4 technical military and naval schools, with 936; 6 military academies, with 3,502; 25 cadet corps, with 8,118; 65 Cossack gymnasias, with 2,446; 22 Cossack girls' gymnasias, with 1,268; and 11 agricultural schools, with 1,449. The Ministry of Railroads maintains 11 technical schools and the Ministry of Finance 16 commercial schools. The institution of the Empress Marie provides for 10 gymnasias and 34 institutes. Of the elementary schools under the direction of the Ministry of the Interior, nine tenths are supported by the local authorities, a few by private individuals, and the rest by the Imperial Government. They numbered 32,708 in 1896, with 53,215 male and 16,768 female teachers and 1,775,861 male and 564,073 female pupils. The Ministry of War had charge of 10,270 schools, with 13,186 male and 363 female teachers and 252,373 male and 48,720 female pupils. Other ministries supervised over 500 schools, and 402 schools, with 7,311 male and 12,364 female pupils, belonged to various foundations, while the Holy Synod had 34,836 primary schools, with 24,185 male and 4,893 female teachers and 910,760 male and 205,732 female pupils. The religious seminaries of the Holy Synod were 55 in number. The training schools for teachers numbered 78, with 4,867 male and 366 female pupils.

Finances.—The ordinary revenue for 1898 amounted to 1,584,854,000 rubles. The yield of direct taxes was 41,069,000 rubles from land and forests, 48,167,000 rubles from trade licenses, and 14,024,000 rubles from a 5-per-cent. tax on capital. Indirect taxes produced 289,573,000 rubles from spirits, 37,461,000 rubles from tobacco, 58,562,000 rubles from sugar, 30,375,000 rubles from matches, naphtha, and other exciseable articles, 218,910,000 rubles from customs, 36,957,000 rubles from stamps, 25,907,000 rubles from transfer duties, and 23,431,000 rubles from passports, railroad taxes, and others. The income from state monopolies was 4,085,000 rubles from mining, 13,821,000 rubles from the mint, 27,406,000 rubles from the post office, 17,175,000 rubles from telegraphs, and 102,164,000 rubles from the sale of spirits. The income from state domains was 16,740,000 rubles from rents, 836,000 rubles from sales of lands, 41,473,000 rubles from the Crown forests, 11,307,000 from the Crown mines, 348,206,000 rubles from railroads, 14,247,000 rubles from Crown capital and banking operations, and 2,372,000 rubles from the share of the Crown in private railroads. The payments of peasants for the redemption of land were 38,018,000 rubles from liberated serfs and 48,134,000 rubles from Crown peasants. The receipts from miscellaneous sources were 12,430,000 rubles for railroad debts, 32,550,000 rubles for Crown debts, 16,291,000 rubles of aid from municipalities, 5,002,000 rubles of military contributions, and 7,560,000 rubles from various sources.

The actual expenditure in 1898 amounted to 1,358,276,000 rubles for all ordinary purposes. The debt service took 273,514,000 rubles, of which 107,522,000 rubles were for railroad debts. The expenses of the higher institutions of the state were 2,840,000 rubles; of the Holy Synod, 20,436,000 rubles; of the imperial house, 12,740,000 rubles; of the Ministry of Foreign Affairs, 5,018,000 rubles. The expenditures of the Ministry of War were 303,277,000 rubles, out of which 19,580,000 rubles went for rearmament and food stores and 4,819,000 rubles for the Transcaspian Railroad. The navy cost 67,289,000 rubles for maintenance. The expenses of the Ministry of Finance were 214,332,000 rubles, including 1,325,000 rubles for loans to railroad companies, etc. The expenditures of the Ministry of Domains and Agriculture were 35,815,000 rubles; of the Ministry of the Interior, 80,176,000 rubles; of the Ministry of Public Instruction, 26,921,000 rubles. The Ministry of Ways and Communications expended 264,995,000 rubles, out of which 187,992,000 rubles were for the exploitation of state railroads and 41,137,000 rubles for a new feeding line and improvements. The expenses of the Ministry of Justice were 42,335,000 rubles. The cost of state control was 7,086,000 rubles, of which 3,480,000 rubles were for railroads. The expense of the imperial studs was 1,699,000 rubles. The ordinary expenditures have increased 308,812,000 rubles since 1888, owing to the gradual purchase of railroads, the additional expenses being for railroad debts, guarantees to shareholders, improvements, and the cost of exploitation and control. This increase has been balanced by additional revenue from railroads. The cost of building new lines forms part of the extraordinary budget. The extraordinary receipts in 1898 amounted to 87,818,000 rubles, of which 77,655,000 rubles were from state loans, 5,101,000 rubles from perpetual deposits at the Bank of Russia, 3,476,000 rubles from payment of debts by railroads, 1,540,000 rubles from sales of state property, and 46,000 rubles from other sources. The extraordinary expenditures were 114,283,000 rubles for building new railroads and increase of rolling stock, 138,509,000 rubles for payment of state debt in the conversion operation, 190,000 rubles for operations for purchase of railroads, 24,800,000 rubles for payment of railroad bonds, and 136,153,000 rubles to the state bank, the nobles' bank, and other outlay. The revised accounts make the total ordinary revenue for 1898 1,584,774,000 rubles and the ordinary expenditure 1,361,575,000, leaving a surplus of 223,199,000 rubles, but the deficit of 325,816,000 in the extraordinary budget left a minus balance of 102,617,000 rubles. For the six years ending with 1898 the ordinary budget shows a surplus of 985,833,000 rubles, the extraordinary budget a deficit of 927,384,000 rubles, giving a balance of 58,449,000 rubles in receipts over expenditures for the entire period.

The estimates for 1899 made the total ordinary revenue 1,469,128,203 rubles, the direct taxes being reckoned at 113,554,631, indirect taxes at 667,182,457 rubles, receipts from domains and railroads at 396,298,198 rubles, sale of spirits at 92,141,000 rubles, reimbursement of railroad and other loans at 58,879,906 rubles, receipts from mint, mines, posts, and telegraphs at 52,875,800 rubles, state peasants' redemptions of land at 40,433,597 rubles, liberated serfs' redemptions at 37,260,403 rubles, war contributions at 3,947,113 rubles, sale of domains at 902,302 rubles, and miscellaneous receipts at 5,652,706 rubles. The ordinary expenditure for 1899 was estimated at 1,462,659,233 rubles, the principal items showing an increase, being 318,691,539 rubles for war, 233,381,888 rubles for fi-

nance, 293,174,883 rubles for communications, 83,065,000 rubles for the navy, 28,761,171 rubles for public instruction, 37,022,627 rubles for agriculture and domains, 21,199,144 rubles for the Holy Synod, and 44,944,651 rubles for justice. The extraordinary expenditure for 1899 was estimated at 109,073,413 rubles, of which 27,154,350 rubles were for the Siberian Railroad, 3,706,256 rubles for works connected with the same, 24,777,782 rubles for other railroads, 46,864,525 rubles for rolling stock, and 6,570,500 rubles for the expenses of railroad debts to be incurred. The only extraordinary revenue foreseen was 4,000,000 rubles from deposits in bank, which left 98,604,443 rubles of deficit to be met. The total ordinary revenue for 1900 was estimated at 1,593,745,680 rubles, the yield of direct taxes being reckoned at 120,365,517 rubles, indirect taxes at 725,945,150 rubles, profits of mint, mines, posts, and telegraphs at 55,585,800 rubles, of the sale of spirits by the state at 118,102,000 rubles, of railroads and domains at 422,748,423 rubles, sales of domains at 578,139 rubles, redemption of land by state peasants at 39,953,159 rubles, by liberated serfs at 37,763,841 rubles, reimbursement of loans at 63,541,018 rubles, war contributions at 3,400,000 rubles, and miscellaneous receipts at 5,762,633 rubles. The expenditure on interest and capital of the state debt for 1900 was set down as 223,039,555 rubles; on railroad obligations, 51,686,609 rubles; cost of higher institutions of the state, 3,007,995 rubles; of the Holy Synod, 23,559,685 rubles; expenses of Ministry of the Imperial Household, 12,899,514 rubles; of Ministry of Foreign Affairs, 5,267,735 rubles; of the army, 324,343,686 rubles; of the navy, 86,628,015 rubles; of the Ministry of Finance, 281,489,304 rubles; of the Ministry of Agriculture and Domains, 40,997,092 rubles; of the Ministry of the Interior, 85,938,484 rubles; of the Ministry of Public Instruction, 33,180,829 rubles; of the Ministry of Railroads, 322,287,968 rubles; of the Ministry of Justice, 46,515,736 rubles; of the state control, 7,721,623 rubles; of the direction of studs, 1,877,849 rubles; unforeseen and war expenses, 14,000,000 rubles, against a provision of 20,000,000 rubles for such contingencies in the previous year's estimates. The total expenditures foot up 1,564,441,679 rubles, and the extraordinary expenditures are estimated at 192,945,424 rubles, offset by 3,000,000 rubles interest on deposits in the national bank and the estimated surplus in the ordinary budget, which leave a deficit of 160,641,423 rubles to be covered. These extraordinary expenditures are 25,195,258 rubles for the Siberian Railroad, 3,418,524 rubles for works connected with it, 30,573,550 rubles for other railroads, 43,758,092 rubles for rolling stock for the Siberian and other railroads, 85,000,000 rubles for loans to railroad companies, and 5,000,000 rubles for negotiations.

Between 1866, when the revenue of the Imperial Government amounted to 353,000,000 rubles, and 1898, when it showed an increase of 450 per cent. over that figure, the financial system has undergone a complete change. From 1866 to 1877 the average annual increase in the revenue was 21,000,000 rubles, of which 12,000,000 rubles was obtained from indirect and 5,400,000 rubles from direct taxation, while the income from royalties and state property was nearly stationary. By this time it was found that new taxes that were imposed ceased to respond to the requirements of the treasury, and even the payments of the peasants for redemption of land were too heavy to be paid promptly. The Government was obliged to abolish some of the direct taxations, such as the poll tax, and to look for new sources of income. A small tax was put on the interest of capital, the

excise duties on spirits and sugar were raised, and some necessaries were taxed for the first time. The direct taxation could yield no more, and even indirect taxes seemed to have passed the limit of elasticity when M. Vishnegradsky became Minister of Finance in 1887. He refrained from taxing severely the rich capitalists and large manufacturers and the landowners, and conceived the plan of making the state itself a capitalist institution. The annual increase of revenue from 1877 to 1887 was 25,000,000 rubles. During his five years of office, M. Vishnegradsky began the nationalization of railroads and developed the royalties and state properties, with the result that, while the indirect taxation yielded an average yearly increase of 12,500,000 rubles, the royalties and state properties gave one of 18,000,000 rubles. The net increase in the five years averaged 27,000,000 rubles annually. M. de Witte, who entered upon office in 1892, gave a further powerful impetus to the development of royalties and state property, and in that way completed the change in the character of the Russian financial policy. In the six years from 1892 to 1898 the average annual increase of revenue was over 100,000,000 rubles. The revenue from state railroads, which amounted in 1887 to scarcely 1,500,000 rubles, rose to 18,000,000 rubles in 1887, to 277,000,000 in 1897, and to 348,000,000 in 1898. The general income from royalties and state property rose from 51,000,000 rubles in 1877 to 103,000,000 rubles in 1887, and to 592,000,000 rubles in 1898. The tendency to make the treasury self-supporting and independent of taxation is growing constantly stronger. The first steps have been taken toward the creation of a petroleum monopoly. The state monopoly of the sale of spirits in certain provinces gave the treasury in 1898 an income of 102,000,000 rubles. The Russian peasantry, forming nearly nine tenths of the population, are directly affected only by the land tax and the payments for redemption of land, giving less than 10 per cent. of the revenues of 1898. These taxes are about 10 rubles a year for each family possessing 12½ acres, and yet the arrears of payments for redemption of land have gone on increasing in spite of coercive measures adopted to enforce payments. In the five years from 1871 to 1875 inclusive the arrears averaged 30,000,000 rubles annually, and in the period from 1891 to 1895 they had grown to 98,000,000 rubles, in 1897 to 105,000,000 rubles, and in 1898 to 116,000,000 rubles. In 1899 M. de Witte, besides lessening the duty on metals, endeavored to make direct payments by the peasants lighter. The exigencies of the Chinese situation and other untoward circumstances compelled the Government to return to the former taxation, even to increase it in some instances, and to reduce expenditures on education and public works. In 1899 the excess of ordinary revenue over ordinary expenditure reached the figure of 209,740,545 rubles, sufficient to balance the extraordinary expenditure and leave a net surplus of about 84,000,000 rubles, notwithstanding a bad state of trade and a general financial depression.

The amount of the state debt on Jan. 1, 1899, was 6,108,792,117 rubles. On Jan. 1, 1900, it was 6,150,134,874 rubles, consisting of 413,785,133 rubles of gold debt paying 3 per cent., 148,382,812 rubles of gold and 6,250,000 rubles of paper debt paying 3½ per cent., 85,247,400 rubles payable in currency and bearing 3.79 per cent. interest, 684,234,149 rubles of consolidated gold 4-per-cent. debt and 2,438,753,830 rubles payable in currency, 247,370,000 rubles of 4½-per-cent. currency debt, 73,255,800 rubles payable in gold and 187,137,538 rubles in paper paying 5 per cent., 139,001,195

rubles of other currency debts, 101,754,939 rubles of 3-per-cent. gold bonds, 1,616,821,278 rubles of 4-per-cent. bonds payable in gold and 1,269,300 rubles payable in paper, and 6,871,500 rubles of 5-per-cent. gold bonds. During the ten years ending in 1897 the state debt payable in gold increased 762,921,505 rubles, while that payable in paper decreased 65,500,832 rubles, and the interest paid in gold increased 23,230,273 rubles, while the interest of the paper debt decreased 15,505,113 rubles; gold annuities also increased 350,558 rubles and currency annuities decreased 16,364,464 rubles, the whole movement showing a growth of 1,078,881,425 rubles of debt reckoned in paper, with an increase of 19,340,296 rubles in the annual interest charge, but a decline of 15,838,027 rubles in the annuities payable each year. Between 1889 and 1897 debts bearing from 4½ to 6 per cent. interest were converted into the 4-per-cent. debt, 944,790,858 rubles payable in gold and 1,654,220,600 rubles payable in paper, the total sum amounting in paper to 3,071,406,887 rubles, reckoning gold at the legal rate of 150. The cost of conversion was 106,301,507 rubles in gold and 129,307,625 rubles in paper, besides 265,301,277 rubles in gold and 31,278,167 rubles in paper, to cover paper currency, the total amounting to 717,989,968 rubles. New loans concluded are a gold debt of the nominal amount of 910,448,375 rubles and a silver debt of 1,674,000,000 rubles, together equal to 3,039,672,562 rubles, for the conversion operation, and there were 391,233,647 rubles in gold and 164,004,800 rubles in paper, together equal to 750,855,270 rubles in silver or paper, for the same purpose. The balance in the treasury on Jan. 1, 1899, was 545,640,652 rubles, from which must be deducted disbursements already provided for, leaving in ready cash 134,885,670 rubles.

The debts due to the state on Jan. 1, 1898, were 290,108 rubles in paper of military contributions from Khiva, 175,626,072 in gold of military contributions from Turkey, 86,568,697 in gold and 123,832,570 rubles in paper from railroads, 1,531,392,928 rubles from peasants for redemption of land, 91,518,196 rubles in paper from local treasuries, 83,105,961 rubles in gold from the land bank for the nobility, and 6,086,346 rubles in gold and 129,490,458 rubles in paper from various debtors; total value in paper, 2,403,644,873 rubles. The famine, pension, military, philanthropic, special agricultural, scientific prize funds and others in the treasury amounted to 314,994,844 rubles. The interest and capital payments for state and railroad debts in 1900 amounted to 274,726,164 rubles, of which 60,052,754 rubles were on external loans, 6,554,839 rubles on external bonds, 30,925,306 rubles on internal loans, 102,355,601 rubles on internal bonds, 20,608,175 rubles on obligations of state railroads, 51,686,609 rubles on obligations of private railroads to be repaid by them, 2,430,000 rubles for payments of interest not yet called for, and 112,880 rubles for banking expenses, all calculated in paper rubles at the rate of 1½ for 1 gold ruble.

The reform of the Russian currency began in 1895, when the Minister of Finance announced that the treasury and the railroads would pay out gold at a certain ratio to be determined from time to time between the paper currency and gold coins. It was first fixed at the rate of 1 ruble 48 copecks for the gold ruble, and before the end of the year at 1 ruble 50 copecks in paper or silver or 15 paper rubles for the new imperial, which contains two thirds as much gold as the old imperial of 15 rubles. The ratio was confirmed in the following year, and the continual and enormous fluctuations in the exchange value of the paper ruble were arrested. In 1897, instead of marking the new

imperial 10 rubles, the mint stamped it 15 rubles and the half-imperial 7 rubles 50 copecks, and a new 5-ruble coin of one third the size of an imperial was minted. A law was passed on Sept. 10, 1897, authorizing the Bank of Russia to issue paper currency according as the needs of commerce are indicated on the condition that a reserve in gold must be held against half the total issue up to 600,000,000 rubles and covering the whole of it beyond that amount. The treasury accumulated gold before gold payments were ventured upon, and from time to time since, receiving gold for the foreign loans placed in Paris and elsewhere. In 1898 the accumulations of gold in the treasury and in the state bank amounted to 1,315,000,000 rubles, exceeding the entire note circulation by 316,000,000 rubles. Of the accumulated gold, 575,000,000 rubles, equal to 862,500,000 rubles in paper, is held as a guarantee fund for the protection of the paper currency, which has been reduced 122,300,000 rubles since 1896. In January, 1900, the amount of paper in circulation was 630,000,000 rubles, against 1,046,500,000 rubles in 1887; amount of gold at the treasury and in the bank, 1,566,400,000 rubles in paper value; amount of silver in circulation, 220,500,000 rubles; guarantee fund, 927,000,000 rubles. The old gold coinage, minted between 1896 and 1897, amounted to 183,305,630 rubles. Since the weight of the imperial was reduced a third the mints coined in the first two years, 1897 and 1898, gold coins of the paper value of 595,467,647 rubles, silver 900 fine of the value of 105,618,391 rubles, and 4,800,000 rubles of base coins; total, 705,885,244 rubles. The gold at the bank and treasury in January, 1899, was 927,000,000 rubles; gold in circulation, 639,400,000 rubles; silver at the bank and treasury, 56,300,000 rubles; silver in circulation, 164,200,000 rubles; paper at the bank and treasury, 112,700,000 rubles; paper in circulation, 517,300,000 rubles.

The Army.—Out of 870,000 young men who reported for service on reaching the age of twenty in 1898 and passed the physical examination, 287,000 were taken into the active army and the navy. Of the rest part were assigned to the reserve and part to the zapas, or secondary reserve. In 1900 the annual contingent of recruits was increased to 197,000. In the active army a soldier in European Russia serves nominally five and really four years, then thirteen years in the reserve and five in the zapas; in the Caucasus, three years in the active army and fifteen in the reserve; in Asia, seven years in the active army and six in the reserve. The *opolchenie*, or militia, has been reorganized, and training is provided for those who have not served in the army, and the first division, composed of men who have been in the army and others who are able-bodied, is intended to supplement the reserves of the army in case of war, while the second division, composed of men who have served in the first and men freed from army service for some infirmity or because they are the support of families, can only be organized as militia for national defense. The Cossacks of the Don, Kuban, Terek, Astrakhan, Orenburg, Ural, Siberia, Semiryetchensk, Transbaikal, Amur, and Ussuri are bound to provide their own horses, arms, and clothing in return for various privileges. Besides those in active service, a second class must stand ready with horses and arms and a third class with arms. The Russian army is composed of 29 army corps, including a corps of guards, 1 of grenadiers, 2 corps in the Caucasus, 2 in Turkestan, and 2 cavalry corps. No statistics of the strength of the Russian army are made public. The approximate strength of the active field army is 27,400 officers and 1,260,000 men,

composed of 19,300 officers and 984,000 men in the infantry, 3,900 officers and 120,000 men in the cavalry, 3,000 officers and 100,000 men in the artillery, 800 officers and 40,000 men in the engineers, and 400 officers and 25,000 men in the train; strength of the fortress troops, 4,000 officers and 262,000 men, composed of 2,500 officers and 170,000 men in the infantry, 1,200 officers and 82,000 men in the artillery, and 301 officers and 10,000 men in the engineers; reserve of the active army, 14,300 officers and 789,000 men, composed of 10,700 officers and 650,000 men in the infantry, 2,500 officers and 100,000 men in the cavalry, 900 officers and 30,000 men in the artillery, and 200 officers and 9,000 men in the engineers; recruiting reserve, 5,900 officers and 346,000 men, composed of 4,400 officers and 270,000 men in the infantry, 800 officers and 40,000 men in the cavalry, 600 officers and 30,000 men in the artillery, and 100 officers and 6,000 men in the engineers; militia, 10,400 officers and 740,000 men, composed of 9,500 officers and 686,000 men in the infantry, 350 officers and 22,000 men in the cavalry, 450 officers and 28,000 men in the artillery, and 100 officers and 4,000 men in the engineers; frontier guards, 1,000 officers and 34,000 men; total war strength of the Russian army, 63,000 officers and 3,440,000 men.

The Navy.—The effective navy on Jan. 1, 1900, consisted of 3 first-class battle ships in the Baltic, with 2 building, and 2 in the Black Sea, where 1 was building; 10 of the second class in the Baltic, and 4 more building, and 5 in the Black Sea; 1 of the third class in the Baltic; 12 coast guards in the Baltic and White Sea, and 1 under construction; 10 armored cruisers in the Baltic, with 2 building; 3 second-class cruisers, and 3 more building, in the Baltic; 1 third-class cruiser in the Baltic, 1 in the Black Sea, and 3 unfinished in the Baltic; and 30 gunboats in the Baltic and White Sea, 2 more building, and 8 afloat in the Black Sea. There are 12 destroyers and 12 more not yet complete, and 50 submarine boats are projected, and some of them begun. Of torpedo boats Russia has 39 of the first class and 6 not quite finished, 41 of the second class, and 101 of the third class. The inland water communications permit these to be used either in the North Sea or in the Euxine. The *Oslabya* and *Pereyvet*, launched in 1898, displacing 12,674 tons, battle ships that serve also as cruisers, carrying 4 10-inch guns in turrets, 10 6-inch quick-firing guns in casemated batteries and 1 in the bow, and 20 3-inch quick firers, have Harvey steel armor, Belleville boilers giving a speed of 18 knots, and coal bunkers for a long cruise. The *Pobieda* is a sister ship. The *Retvisan*, of 12,700 tons, armed with 4 12-inch guns in turrets and 12 6-inch and 20 3-inch quick firers, resembles the British *Majestic*, and the *Tsarevich* is similar. The *Borodino*, *Alexander III*, and *Orel* may be of either of these types. The *Kniaz Potemkin* and *Tavrishesky*, of 12,480 tons, are of the same size as the *Tri Svititelia*, and combine the merits of that vessel, which is of the British *Trafalgar* type, with those of the *Poltava* class, which includes the *Petropavlovsk* and the *Sevastopol*. The *Poltava*, of 10,960 tons, launched in 1894, carries 4 12-inch guns in turrets, 8 6-inch quick firers in 4 turrets on the upper deck, 4 other 6-inch, and 34 smaller quick-firing and machine guns. The same arrangement is followed in the smaller *Rostislav*, of 8,880 tons, which has 10-inch breechloaders and a smaller quick-firing armament, with no guns mounted on the main deck. The protected cruisers *Diana*, *Pallada*, *Aurora*, and *Bogatyr*, launched in 1898 and 1899, carrying 8 6-inch, 20 3-inch, and smaller quick firers, and steaming 20 knots with engines of 11,610 horse

power, will be excelled by the Waryag and Boyarin, one built in Philadelphia and the other in Copenhagen, which have the same displacement (6,500 tons), a more powerful armament, consisting of 12 6-inch, 12 3-inch, and 6 smaller quick firers, and engines of 20,000 horse power, giving a speed of 23 knots, advantages obtained, however, at the cost of the cruising radius. The armored cruiser Kurik, launched in 1892, having a displacement of 10,933 tons, is protected at the water line by 10 inches of armor for four fifths of the vessel's length, carries a powerful armament, and has capacity for 2,000 tons of coal, sufficient for a cruise of 20,000 miles at a speed of 10 knots. The Gromovoi, of 12,336 tons, is an improvement on the Rossia, of 12,130 tons, launched in 1896, having most of her guns in armored casemates and a more powerful quick-firing armament, consisting of 20 3-inch and 24 smaller guns in addition to the 16 6-inch quick firers, which both vessels have besides 4 8-inch guns in the main battery. The Bayan and Askold, of 7,800 tons, built in France, resemble the French Desaix, their armament consisting of 2 8-inch, 8 6-inch, 20 3-inch, and 7 smaller quick firers. A recent type of coast-defense armor clads is seen in Admiral Ushakoff and Admiral Seniavin, of 4,126 tons, having 10-inch armor, a strong battery, consisting of 4 9.4-inch guns and 4 4.7-inch and 36 smaller quick firers, and a speed of 16 knots. The still later General Admiral Apraxin differs only in having 3 10-inch in the place of 4 9.4-inch guns in the turrets. A new ship will be of greater strength, having a displacement of 6,000 tons. A new type of river gunboat is exemplified in the Gilyak, built for service in the Chinese rivers, with 10 feet draught, carrying 1 4.7-inch and 5 3-inch quick firers, and having a displacement of 1,300 tons. In the naval budget of 1901, amounting to 97,000,000 rubles, about 37,000,000 rubles go for construction and armament. Besides the 3 battle ships of 13,516 tons, the Borodino, Orel, and Alexander III, ordered to be built at St. Petersburg, a fourth has been authorized, the Prince Suvaroff. A new coast-defense armor clad of the type of the Admiral Apraxin will be built, to have a displacement of 5,000 tons; also a cruiser of 3,000 tons for the Pacific, a coal transport of 7,200 tons, a new imperial yacht, and 2 torpedo boats, 60 feet long, for escorting the Czar's yachts. At Nikolaieff, on the Black Sea, will be constructed a first-class cruiser of 6,250 tons and 6 torpedo vessels of 350 tons each; at Sebastopol, another cruiser of 6,250 tons and 12 torpedo boats for Port Arthur. The new vessels will carry 12.4-inch and 8.45-inch guns, and numerous 6-inch quick firers.

Commerce and Production.—The crops of cereals and pulse in European Russia in 1898 amounted to 2,642,190,000 pounds of 36 pounds, the average for the preceding five years having been 2,737,297,000 pounds. The wheat crop was nearly 10 per cent. above the average, and barley and minor crops were better, but in rye and oats there was a falling off. The main crop is rye, of which 986,970,000 pounds were grown in 1898; of wheat, 555,337,000 pounds; of oats, 496,153,000 pounds; of barley, 338,542,000 pounds; of buckwheat, millet, mixed grain, peas, lentils, and beans, 265,188,000 pounds. In Poland, 36,039,000 pounds of wheat, 111,696,000 of rye, 25,892,000 of barley, 49,192,000 of oats, and 16,929,000 of various crops were produced; in northern Caucasia, 86,813,000 pounds of wheat, 8,640,000 of rye, 33,372,000 of barley, 11,002,000 of oats, and 29,271,000 of various crops; on the steppes, 24,829,000 pounds of wheat, 1,247,000 of rye, 3,627,000 of barley, 7,464,000 of oats, and 10,245,000 of various crops; in Siberia, 60,073,000 pounds of wheat, 35,087,000 of rye,

6,518,000 of barley, 45,420,000 of oats, and 4,107,000 of various crops. The total production of wheat for the empire, as shown by these figures, was 763,091,000 pounds, compared with an average of 701,321,000; of rye, 1,143,640,000 pounds, compared with 1,219,392,000; of barley, 407,951,000 pounds; of oats, 609,231,000 pounds; of various and mixed grains and pulse, 325,740,000 pounds. The crop of potatoes in 1898 was 1,037,358,000 pounds in European Russia, 384,589,000 in Poland, 22,599,000 in northern Caucasia, 20,279,000 in Siberia, and 1,838,000 on the steppes; total, 1,466,663,000 pounds, compared with an average of 1,335,077,000 for the five years last preceding. In 1899 there was a wheat crop of 500,869,000 pounds in Russia proper, 33,015,000 in Poland, and 84,533,000 in north Caucasia; a rye crop of 1,170,698,000 pounds in Russia, 110,814,000 in Poland, and 9,705,000 in north Caucasia; a barley crop of 247,911,000 pounds in Russia, 25,892,000 in Poland, and 26,461,000 in north Caucasia. The crop of flax in Russia in Europe for 1899 was 694,348 tons, and of linseed 27,655,500 bushels on 5,173,000 acres; of hemp, 221,000 tons of fiber and 13,293,500 bushels of seed on 1,904,300 acres; of hops, 1,936 tons. The crop of hay was 33,912,000 tons in Russia, 1,911,000 tons in Poland, 4,975,000 tons in northern Caucasia, 6,670,300 tons in Siberia, and 2,262,400 tons on the steppes; total, 49,730,700 tons, from 92,994,000 acres. The wine made in Transcaucasia in 1899 was 17,043,000 gallons from 250,675 acres of vineyards, and 10,265 acres there yielded 3,392 tons of tobacco in 1897, while in Kuban 29,400 acres yielded 12,830 tons. There are large plantations of tea in Transcaucasia, and silk is also produced. In Transcaucasia 20,400 tons of cleaned cotton were produced in 1898. The Ministry of Agriculture has 68 experimental farms in different parts of the empire. More than a third of the area of European Russia is covered with forests, which have an extent of 422,307,000 acres, while in Poland there are 6,706,000 acres. Finland has 50,498,000 acres, and Caucasia 18,666,000 acres. The total forest area under the management of the Government in 1898 was 306,739,983 acres in the European dominions and 326,981,305 acres in Asiatic Russia. In European Russia 96,873,300 acres of forest have been declared to be preservative of rivers, and in such areas the Government allows no felling of timber that can diminish their protective value. About 20,000,000 acres of Siberian forests are to be exploited for the Government, and at the mouth of the Ob a port will be established for the shipment of the timber from these Crown forests, which are in Tomsk and Tobolsk. Manufacturing industries have made rapid strides in some parts of Russia and in Poland, especially the iron, cotton, naphtha, and sugar industries, and the manufacture of paper, leather, various textiles, ceramics, chemical products, tobacco, wood wares, spirits, beer, etc. There were 39,232 industrial establishments reported in 1896, employing 1,742,181 work people, and producing goods valued at 2,745,149,000 rubles a year. The production of refined sugar in 1898 was 754,758 tons.

The imports of Russia in 1898 had a total value of 562,013,000 rubles; exports, 709,984,000 rubles. The imports of food substances were valued at 69,803,000 rubles, and exports at 433,496,000 rubles; imports of raw and partly manufactured articles at 302,134,000 rubles, and exports at 238,397,000 rubles; imports of animals at 1,511,000 rubles, and exports at 16,848,000 rubles; imports of manufactured goods at 188,565,000 rubles, and exports at 21,243,000 rubles. The exports of wheat were 57,047,464 hundredweight; of rye, 21,553,718 hundredweight; of barley, 34,108,714 hundred-

weight; of corn, 14,886,321 hundredweight. The exports of eggs, 1,831,000,000 in number, were valued at 31,620,000 rubles. The value of cereals and flour exported was 370,463,000 rubles; of dairy produce, including eggs, 38,325,000 rubles; of spirits, 1,774,000 rubles; of sugar, 7,176,000 rubles; of timber and wood wares, 57,715,000 rubles; of linseed, grass seed, and other seeds, 26,905,000 rubles; of flax, 57,786,000 rubles; of hemp, 10,865,000 rubles; of tallow, 507,000 rubles; of bristles, hair, and feathers, 7,716,000 rubles; of wool, 6,894,000 rubles; of furs, 4,020,000 rubles; of woollen goods, 2,216,000 rubles; of cotton goods, 2,967,000 rubles; of naphtha and naphtha products, 25,630,000 rubles. The export of illuminating oil increased from 15,998,000 hundredweight in 1894 to 17,349,020 hundredweight in 1898; of lubricating oil, from 2,092,000 to 3,382,900 hundredweight. The number of horses exported in 1897 was 58,300; the export of oil cake was 12,769,000 rubles in value.

The imports and exports by the frontier of Asia are not included in the above figures excepting those from the Black Sea coast of the Caucasus. The imports amounted to 49,043,000 rubles and the exports to 21,042,000 rubles. The main part of this trade is by the frontier of Manchuria. The imports of food substances, principally tea, were 30,888,000 rubles in value, and exports 7,888,000 rubles; imports of raw and partly manufactured articles were 10,897,000 rubles, and exports 2,513,000 rubles; imports of manufactured goods were 5,453,000 rubles, and exports 10,149,000 rubles; imports of animals were 1,805,000 rubles, and exports 492,000 rubles.

The chief imports of Russia are raw cotton, raw metals, machinery, raw wool, metal goods, tea, leather, coal, wines, silk, textile goods, chemicals, colors, gum and resin, fish, fruits and nuts, coffee, cotton goods, watches and clocks, and tobacco. The value of imports from Germany in 1898 was 202,117,000 rubles; from Great Britain, 113,966,000 rubles; from the United States, 49,430,000 rubles; from France, 27,087,000 rubles; from Austria-Hungary, 24,123,000 rubles; from Belgium, 23,621,000 rubles; from China, 22,636,000 rubles; from Egypt, 22,636,000 rubles; from Italy, 10,149,000 rubles; from the Netherlands, 9,775,000 rubles. The value of the exports to Germany was 179,254,000 rubles; to Great Britain, 140,447,000 rubles; to the Netherlands, 79,072,000 rubles; to France, 63,424,000 rubles; to Italy, 54,447,000 rubles; to Austria-Hungary, 41,652,000 rubles; to Belgium, 28,788,000 rubles; to Turkey, 13,956,000 rubles; to Roumania, 12,675,000 rubles; to Denmark, 9,839,000 rubles.

Many parts of the Russian Empire are exceedingly rich in minerals. The coal and iron industries have made great progress. Duties have been placed on imported coal to increase the consumption of the domestic product. The gold production of the Urals has declined to a fraction of what it once was. Platinum is still produced there, and in increasing quantities. The gold mines of Siberia are becoming more productive. In order to increase their production much more by the introduction of modern methods and machinery and thus obtain a larger supply of the precious metal to support the gold standard, the Russian Government in 1900 granted to an English syndicate a concession of 8,200 square miles of auriferous land on the imperial property in the Nertchinsk region. In the Donetz region of European Russia, which is particularly rich in coal, Belgians have developed the coal mines and other industries, especially glass making. Large numbers of Belgian workmen took up their residence in the Donetz, and the prosperity of the Belgians awakened the

resentment of both the peasantry and the nobility who had sold their lands to Belgian capitalists without being aware of the wealth existing under the soil. In 1900 disturbances occurred from this cause.

On Aug. 5 the general tariff was raised on many articles as a temporary measure for providing means to defray the extraordinary expenses necessitated by the Chinese troubles. On flour, wine, beer, fruits, spices, tobacco, fish, and gums it was increased 50 per cent.; on coffee, boots and shoes, and lumber, 30 per cent.; on porcelain wares, fancy cutlery, gold watches, vehicles, linens, clothing, and ornamental metal wares, 20 per cent.; and 10 per cent. on a long list of articles. In order to check the rise in the price of naphtha due to trade combinations the Government determined to enter into competition with the merchants, requiring the lessees of the oil wells on the Crown lands of the Baku district to pay 40 per cent. of their rent in kind after 1901.

Navigation.—The number of vessels in the foreign trade entered at White Sea ports during 1898 was 712, of 395,262 tons; at Baltic ports, 5,809, of 3,554,879 tons; at ports of the Black Sea and the Sea of Azof, 4,426, of 665,611 tons; the number cleared at White Sea ports, 703, of 376,370 tons; at Baltic ports, 5,736, of 3,765,777 tons; at ports of the Black Sea and the Sea of Azof, 4,374, of 6,615,890 tons; total number entered, 10,947, of 4,615,752 tons; total number cleared, 10,813, of 10,758,037 tons. The ports of the Caspian were visited in 1896 by 18,055 vessels in the foreign and coasting trade, of 233,714 and 8,360,269 tons respectively; the Pacific ports of Vladivostok and Nikolaievsk by 347 vessels, of 313,531 tons. The number of coasting vessels that visited White Sea, Baltic, and Black Sea ports was 38,943, of 13,794,870 tons; and Caspian ports, 17,284, of 8,360,269 tons.

Railroads, Posts, and Telegraphs.—On July 1, 1899, there were 29,855 miles of railroad in operation in the Russian Empire, including 1,611 miles in Finland. The lines owned and operated by the Government had a total length of 16,414 miles; lines belonging to public companies, 9,365 miles; isolated and unconnected railroads, 1,691 miles; short local lines, 774 miles. The Siberian trunk line to Lake Baikal, 1,201 miles, was already in operation in 1898, and at the end of 1899 the continuation to Sryatensk, 693 miles, was opened, establishing steam communication between St. Petersburg and the Pacific coast, the trains being for the present ferried across Lake Baikal. Other important railroads recently completed are the lines from Vologda to Archangelsk, 397 miles; from Tiflis to Kars, 186 miles; from Perm to Kotlas, 545 miles; from Sievalki by way of Augustovo to Grodno, 620 miles; from Tikhoryetskaia to Tsaritsyn, 335 miles; from Khavi to Tashkend, 96 miles; and from Samarkand to Andijan, 335 miles. There are 28 lines in the empire connecting with each other, 16 of which, containing 60 per cent. of the mileage, are worked by the Government and the rest by public companies under the control of the Minister of Ways and Communications. The isolated lines are 7 in number. Whereas 76 per cent. of the network belonged in 1889 to companies, of which there were then 42, and the state had a deficit of 30,000,000 rubles in the railroad account, in 1899 the remaining 9 companies operated only 40 per cent. of the railroads, and the Government, by taking over the railroads, reached a balance in the railroad budget in 1895 and earned a net profit of 11,300,000 rubles in 1896, 12,500,000 rubles in 1897, and 12,100,000 rubles in 1898. The introduction of the zone tariff in 1894,

reducing the fares for long journeys by 60 per cent., increased receipts from passenger traffic by 18 per cent. in three years. In 1898 there were 70,877,406 passengers, 39 per cent. more than in 1894. The freight traffic increased from 69,848,000 tons in 1891 and 88,916,000 tons in 1894 to 97,170,726 tons in 1898. The gross income of the Government from railroads increased from 301,709,000 rubles in 1892 to 457,550,000 rubles in 1892. The net receipts in 1896 were 176,733,000 rubles, compared with 107,677,000 rubles in 1892. The capital cost to the state of its railroads up to the end of 1898 was 2,744,923,577 rubles. The expenses of the Government lines in 1898 were 157,366,602 rubles. The net receipts were 119,666,619 rubles. Deducting 110,635,698 rubles, interest on the debt incurred for the purchase of the railroads, the net profit of the Government was 9,030,921 rubles. The railroads operated by the subsidized companies had a length of 8,101 miles, including 516 miles leased from the Government, and 2,465 miles were under construction in 1897. The capital cost of the companies' lines was 1,005,145,885 rubles; receipts in 1896 were 140,224,306 rubles, and expenses 81,851,251 rubles, making the net receipts 58,973,055 rubles, from which 41,668,695 rubles of interest on capital is deducted to arrive at the net profits of the companies, which were 17,304,360 rubles. The debt of the companies to the state was reduced by additional transfers of railroads during 1897 from 819,170,204 rubles to 253,685,615 rubles on Jan. 1, 1898. The traffic of the Transcaspiian Railroad is not included in the reports of the Ministry of Ways and Communications. It was built for military transport primarily, and is managed by the Ministry of War. The freight traffic increased from 292,500 tons in 1896 to 390,100 tons in 1897, the gross receipts from 5,449,030 rubles to 7,061,000 rubles. New lines will be built by the Government connecting Poltava with Kieff, Nishni-Novgorod with Romanovo, Zemethina with Kustarevka, and St. Petersburg with Kieff by way of Vitebsk and Mohileff. An Asiatic line is projected to run from Orenburg to Tashkend. The Manchurian Railroad, built to connect the trunk line of the Siberian Railroad with Vladivostok by a direct route across Manchuria from the Onon station in Transbaikalia, was undertaken by a company formed in 1896 under the auspices of the Russian Government. By arrangement with the Chinese Government a branch has been built from the Manchurian Railroad at Bedune to Port Arthur and Dalnii. The line to Vladivostok, however, has not been completed. Its length is estimated at 1,273 miles, of which 945 miles are in Chinese territory. Engineering difficulties must be surmounted in the Sungari valley, though not so great as on the longer route selected for the main line through Russian territory from Sryatensk to Pokrovskoye on the Amur. Including the Transcaspiian railroads there were nearly 37,000 miles of railroads completed by the end of 1899, the construction during the year having been about 2,700 miles. The prosperity of Russian industry and commerce has been generally attributed to the bringing of the railroads under the control of the state, which has extended the network with a view to the general advancement of the country and wrought great improvements in the way of unifying tariffs and cheapening fares and freights all over the empire. Recent acquisitions have made the extent of the state-owned network more than 22,000 miles out of the 37,000, whereas in 1889, out of 19,000 miles then completed, only 4,250 miles belonged to the Government. In equipment, roadbeds, and speed, as well as in

uniformity of charges and cheapness, there have been great improvements. The new lines in course of construction on Jan. 1, 1900, amounted to about 6,000 miles, while 1,500 miles were authorized but not yet begun. On the Siberian line large sections had to be rebuilt and relaid and new bridges to be put up because the freight traffic was much greater than had been anticipated. In the construction of this line the estimates were not exceeded on any of the sections, and the work was all done within the time calculated. In 1902 the entire line is expected to be completed. In 1897 freight exceeded 490,000 tons, double the amount anticipated. In that and the following year 200,000 arrived in addition to the ordinary passenger traffic of 400,000. A new great Asiatic line is proposed, to start at Andijan, the present terminus of the Transcaspiian Railroad, be carried from there to Kashgar, in Chinese Turkestan, thence through Yarkand to Khotan, near the Polu pass leading into Tibet, then eastward to the headwaters of the Cherehen Daria and Lob Nor, whence it would pass through the Altyn mountains and over the Tsaidam plateau to the head waters of the Hoang-Ho, then down the valley of that river to Lanchow and on to Singan-Fu, and from that place to some point on the Pekin-Hankow Railroad, the total route being in the neighborhood of 2,000 miles. The line from Orenburg to Tashkend, on which work was begun in 1900, will connect the Transcaspiian Railroad directly with the Russian system. A line of political importance is being constructed from Alexandropol, in the southern Caucasus, to Tabriz, in the Persian province of Azerbaijan, passing by Nakhitchevan, near the Persian frontier, where there are extensive deposits of coal, iron, copper, and other minerals.

The state telegraph lines had a total length on Jan. 1, 1898, of 90,383 miles, with 253,648 miles of wire. There were 17,661,056 private telegrams transmitted during 1897. The telephone lines had 25,906 miles of wire in 1897, and 89,509,831 conversations were held, an increase of over eightfold since 1894. At the end of 1898 St. Petersburg and Moscow were placed in telephonic communication.

Finland.—The grand duchy of Finland, ceded to the Emperor of Russia on Sept. 17, 1809, by the treaty of Fedrikshamn, retained by the grant of Alexander I some of its constitutional liberties. Laws for Finland are prepared in the State Secretariat of Finland, consisting of the State Secretary and four members nominated by the Emperor, two of them being proposed by the Senate of Finland. The Senate at Helsingfors is nominated by the Crown, and has charge of the post office, railroads, canals, customhouses, public health, and courts of law, being divided into the Departments of Finance and Justice. The national Parliament of Finland, in which the four estates of the nobles, the clergy, the burghers, and the peasants are represented, can discuss and amend the projects of law, but the Czar, who bears the title of Grand Duke of Finland, may veto its action. No new taxation and no amendment of the Constitution can be enacted without the consent of the four estates in Parliament. Finland has its own money and customs tariff. Of a population of 2,592,864 in 1897, the number dwelling in towns was 291,584; in the rural districts, 2,301,280; the number of males, 1,281,420; of females, 1,311,444. The number of Swedes was 351,300; of Russians, 7,300; of Germans, 1,820; of Laps, 1,160. The Finns numbered 2,231,300. The value of imports in 1898 was 237,000,000 marks, of which 81,900,000 marks came from Russia, 74,900,000 marks from Germany, 38,400,000 marks from Great Britain, 15,600,000 marks from Sweden and Nor-

way, 8,200,000 marks from Denmark, 4,400,000 marks from France, 2,100,000 marks from Spain, and 11,500,000 marks from other countries. The value of exports was 178,000,000 marks, of which 49,000,000 marks were exports to Russia, 53,900,000 marks to Great Britain, 17,000,000 marks to Denmark, 16,100,000 marks to France, 15,000,000 marks to Germany, 7,600,000 marks to Sweden and Norway, 5,300,000 marks to Spain, and 14,100,000 marks to other countries. The export of timber was 91,200,000 marks in value; of butter, 27,000,000 marks; of paper pulp and paper, 17,200,000 marks; of iron, 4,100,000 marks. The imports of cereals amounted to 44,400,000 marks; of machinery, 19,300,000 marks; of iron manufactures, 19,200,000 marks; of cotton and cotton goods, 13,000,000 marks; of woolens, 8,900,000 marks; of coffee, 8,800,000 marks; of sugar, 7,600,000 marks. The number of vessels entered at the ports of Finland during 1898 was 8,566, of 1,918,675 tons, of which 5,878, of 862,697 tons, were Finnish; 606, of 90,575 tons, Russian; and 2,082, of 965,403 tons, foreign. The number of vessels cleared was 8,588, of 1,927,605 tons, of which 5,904, of 874,471 tons, were Finnish; 608, of 89,919 tons, Russian; and 2,076, of 963,215 tons, foreign. The mercantile marine of Finland consisted on Jan. 1, 1899, of 1,896 sailing vessels, of 271,824 tons, and 236 steamers, of 41,043 tons. The length of railroads on Jan. 1, 1898, was 2,553 kilometres, all the property of the Government excepting 80 kilometres; the number of passengers carried in 1897 was 4,263,775; tons of freight, 1,662,260; capital cost, 205,556,651 marks; receipts, 19,523,972 marks; expenses, 12,281,655 marks. The number of letters and postal cards carried in the mails in 1897 was 14,053,794; parcels, 2,685,499; newspapers, 13,380,810; registered letters, 1,005,005; receipts, 2,612,777 marks; expenses, 2,246,076 marks.

The protests of the Finnish estates against the military service law incorporating the Finnish contingent with the Russian army were disregarded, and in an imperial message they were warned that they must confine their attention to local and economical questions. On the reassembling of the Diet at Helsingfors, in February, 1900, the representatives of all the four estates firmly declared that they could not renounce their right to self-government, to equal justice, and to the rule of law. The Russian authorities responded by enforcing the censorship more rigorously against Finnish newspapers. The Finnish estates held that a law, whether fundamental or general, to be valid in the country can be enacted only with the consent of the estates; that neither the institutions of Russia nor its autocratic system have been introduced into Finland, nor have they any force there; that the Russian Council of State can not act as a legislative organ for Finland; that the imperial manifesto and the statutes based upon it are inconsistent with the right of making their own laws, which, according to the Constitution of Finland, belongs to her people; that if a change in the Constitution should in any circumstances become expedient, this can only be brought about, unless the sanctity of the fundamental law

be violated, with the co-operation of the estates. The Finns were aware that the law requiring Finnish soldiers to serve in Russian regiments was the prelude to a process of Russification such as has been carried out in Poland and in the Baltic provinces, and that in defending, as well as they could by passive resistance, their constitutional right to legislative autonomy they were fighting for the preservation of their nationality. An imperial ukase published on June 26, 1900, commanded the gradual introduction and the use of the Russian language in all the official departments and public offices of Finland, beginning with the Chancery of the Secretary of State and the Senate. Five years were given for the minor and provincial officials to prepare for the adoption of Russian exclusively in their communications with their superiors. Private individuals, however, would be allowed to use the native tongue freely in all their business with public departments and authorities. For protesting vigorously against this decree the *Nya Pressen*, Finland's most important newspaper, was suppressed forever. The Finnish Senate refused to promulgate the imperial manifesto on the ground that it was unconstitutional. Although a committee had prepared the decree as early as January, its publication was delayed until after the dissolution of the Diet. When peremptory orders came for the Senate to publish the manifesto, 14 of the Senators resigned and the remaining 7 still held out. The effect of making Russian the official language would be to transfer the higher administration to Russians. The ukase stated that Alexander I, in taking possession of Finland in 1808, declared that Finnish and Swedish were to be used as official languages only until such time as Russian could be introduced. In a protest signed by the members of the Diet it was urged that Finnish and Swedish were not local languages in subordination to an imperial language, but the national languages of Finland, and when the relations of the grand duchy and Russia had been defined at the meeting of the estates at Berga the Emperor Nicholas recognized the right of the Finns to use their own language in the administration; otherwise the promise embodied in a fundamental law that only native-born Finlanders should, with a few exceptions, be Government officials would have no meaning. Public meetings in which the Finns could express their indignation were forbidden, as well as the formation of patriotic associations for the defense of national liberties. Against such denial of the constitutional rights of meeting and association the members of the Diet protested in a petition to the Czar. The Secretary of State, as well as the Governor General, was a Russian not born in Finland. The decision of the Emperor with regard to the petition of the Diet was that it could not be considered because it clashed with the constitution of the Diet and censured administrative measures legally put into force. Governor-General Bobrikoff was informed that he had acted correctly and in accordance with imperial instructions, and the Diet was forewarned that a revision of its constitution in order to define its competency was impending.

S

SALVADOR, a republic of Central America. The legislative power is vested in the National Assembly, a single chamber of 42 members, 3 from each department, elected every year by universal suffrage. The President is elected by the direct popular vote for four years. The President

elected for the term beginning March 1, 1899, is Gen. Tomas Regalado. The Vice-President is Dr. Prudencio Alfaro. The Cabinet in 1900 was composed as follows: Minister of Foreign Affairs and Justice, Dr. F. A. Reyes; Minister of the Interior, War, and Marine, Dr. Rubén Rivera; Minister of

Charity and Public Instruction, Dr. J. Triqueros; Minister of Finance, Public Credit, and Public Works, Dr. F. A. Nova.

Area and Population.—The area of Salvador is 7,225 square miles. The population in 1894 was 803,534. The capital, San Salvador, has about 50,000 inhabitants, including most of the natives of pure Spanish descent and the Europeans. Education is gratuitous and compulsory. There are 2 normal, 3 technical, and 13 other higher schools, besides the national university, and 585 elementary schools attended by 29,427 children. In the university are 180 students.

Finances.—The revenue for 1900 was estimated at \$4,992,520, of which \$3,004,420 came from customs and \$1,988,100 from excise duties, stamps, a tax on gunpowder, a road tax, and registration fees. The expenditures estimated for 1900 were \$31,515 for the Legislature, \$32,800 for the presidency, \$751,392 for the Ministry of the Interior, \$380,640 for the Ministry of Fomento, \$338,852 for public instruction, \$256,980 for public charity, \$294,838 for justice, \$366,969 for finance, \$1,639,800 for the public debt, \$76,080 for foreign relations, and \$1,031,860 for the army and navy; total, \$5,201,720.

The foreign debt in 1899 amounted to £726,420 sterling. The Salvador Railway Company, an English corporation, undertook to defray the expenses of the debt and with the aid of a subsidy from the Government to complete before June 30, 1900, the railroad from Sitio del Niño to San Salvador. This company succeeded to the railroads and concessions formerly held by the Central American Public Works Company of London. There is an internal debt of about \$8,000,000. The gold standard was proclaimed by the Government in August, 1897, and the importation of debased silver coin was prohibited. The mint, which was formerly a private enterprise, was transferred to the Government in October, 1899. Gold is at a premium of 15 or 16 per cent.

The Army.—The number of active troops is about 3,000 men, varying greatly at different times. The number in the militia approaches 18,000. In case of war every able-bodied Salvadorian is liable to service up to the age of fifty.

Commerce and Production.—Coffee is the chief product, and after it come sugar, indigo, rubber, balsam, and tobacco. Silver is mined, and some copper, gold, and mercury. The exports of coffee in 1898 were 38,626,479 pounds; of sugar, 1,996,408 kilogrammes. The chief imports are cotton goods, liquors, iron manufactures, flour, silks, and yarn. The United States have the largest share of the import and export trade, but Great Britain is not far behind, and Germany and France have also important shares.

Railroads, Posts, and Telegraphs.—A railroad runs from the port of Acajutla to Santa Anna and Tecla, having a length of 72 miles. Other railroads are building.

The postal traffic in 1897 amounted to 1,600,000 letters. The telegraphs in 1899 had 1,850 miles of wire, and there were 750 miles of telephone wire.

SAMOA, a group of islands in the Pacific, a part of them belonging to Germany and a part to the United States. At a conference held in Berlin in 1889 representatives of Germany, the United States, and England signed an act guaranteeing the neutrality of the islands and their independence under their native kings. International complications and native disturbances following upon the death of King Malietoa in 1898, a joint commission was appointed which recommended the abolition of the kingship and the ter-

mination of the joint protectorate. Germany and England made an agreement on Nov. 14, 1899, by which England renounced in favor of Germany all rights over the islands of Upolu and Savaii, and in favor of the United States all rights over Tutuila and minor islands. In January, 1900, this arrangement was accepted by the United States, which in return for the sole dominion in Tutuila and dependencies resigned to Germany all rights over the other islands.

The German Islands.—Savaii is the largest island of the group, 47 miles long and 28 miles wide. Upolu, of about the same length but narrower, contains the seaport of Apia and the principal cocoanut and cacao plantations. The natives of the islands are Polynesians, Christianized, but still superstitious and warlike. The trade is carried on by a German company, which exchanges trade goods for copra, and by private merchants, most of them citizens of New Zealand or of the United States. The imports in 1897 were valued at £65,926, and exports at £47,839. Clothing, provisions, and kerosene are the chief imports. The number of vessels that visited Apia during 1897 was 77, of 81,736 tons. Dr. Solf, president of the municipal council of Apia, was appointed Governor of German Samoa. For the settlement of claims of Americans, Germans, and British arising out of the acts of the three protecting powers during their joint control of Samoa it was arranged to refer them to a court of arbitration. King Oscar of Sweden and Norway, on Aug. 22, 1900, accepted the post of arbitrator. Governor Solf established a local native magistracy, at the head of which he placed Mataafa, the late claimant for the throne. The Samoans have preserved their native manner of life and the natural vigor and fecundity of the Polynesian race, and still number 35,000, while the Hawaiians have shrunk to less than that number, and in Tahiti and Tonga the race is disappearing, as in Tasmania and other islands it has disappeared. A few German planters have met with moderate success, although it is impossible to train the Samoans to steady labor for hire and imported laborers come too dear. The plantations of cotton, tea, cinchona, sugar, cinnamon, and vanilla that were started in the earlier days of German enterprise have proved unremunerative. Cacao and coffee have been planted more recently, and promise success. Many fruits, such as pineapples, bananas, papaya, oranges, lemons, mangoes, guavas, and alligator pears, now growing wild, would repay cultivation. The staple product is copra, the kernel of the cocoanut, from which oil is extracted in Germany.

Tutuila.—The island of Tutuila, which with many small islands came into American possession in January, 1900, contains the harbor of Pango Pango, which the King of Samoa ceded to the United States for a coaling and naval station in 1872. The line separating the German islands from the American is the meridian 171° east of Greenwich. The islands east of this line belong to the United States, Tutuila has an area of about 54 square miles and 3,800 inhabitants. The area of Manua and other small islands is about 25 square miles. Tutuila, like the German islands, is mountainous and has a fertile volcanic soil. It is covered with the finest woods, and in climate and natural beauty is the most attractive island of the group. The United States occupied and began the improvement of Pango Pango harbor in 1898, before the division of the islands was settled. The harbor is completely landlocked, and is the only safe one in Samoa. It is very deep and roomy, and is entered through a passage cut in

the coral reef outside. Commander Tilley was appointed to the governorship of Tutuila as well as to the command of the naval station at Pango Pango. Peace and contentment prevailed on all the islands after the division, and especially on Tutuila, where native chiefs were appointed to rule districts and villages under the guidance and control of the naval governor, but according to native customs. A steel building was constructed for the storage of coal at Pango Pango.

SANTO DOMINGO, a republic in the West Indies, occupying the eastern part of the island of Hayti. The Congress is a single chamber of 24 members, elected by direct qualified suffrage for two years, 2 members for each province and 2 for each maritime district. The President is chosen by an electoral college for four years. Gen. Juan I. Jimenez was elected President, and Horacio Vasquez Vice-President, after the assassination of President Ulisses Heureaux and a subsequent revolution, for a term ending in 1903. Gen. Jimenez appointed as members of his Cabinet the following: Secretary of the Interior and Police, Gen. J. Pichardo; Secretary of Foreign Affairs, Enrico Henriquez; Secretary of Justice and Public Instruction, S. E. Valverde; Secretary of Fomento and Public Works, Gen. T. Cordero; Secretary of Finance and Commerce, J. de J. Alvarez; Secretary of War and Marine, Gen. T. D. Morales.

Area and Population.—The republic has an area of 10,045 square miles and a population estimated at 610,000. The people are a mixed race of Spanish, Carib, and African blood, with a much smaller proportion of pure negroes than in the adjacent republic of Hayti. Santo Domingo, the capital, the most ancient town in North America, has 14,150 inhabitants. Many Cubans have settled in the country in recent years. Elementary education is free and nominally compulsory. About 10,000 children attend school.

Finances.—The revenue in 1898 was \$1,550,294 in gold, mainly derived from duties on imports and exports. The foreign debt was converted in 1897 into a unified loan of £2,736,750 paying 2½ per cent. interest, and a loan of \$7,500,000 paying 4 per cent., both secured by the customs and other assigned revenues, the collection of which was intrusted to the Santo Domingo Improvement Company of New York, which undertook to complete the railroads and harbor improvements for which these sums had been borrowed. The contracts with the company were not carried out, and in April, 1899, the Government defaulted in the payment of interest. The United States gold dollar was adopted as the legal standard on July 1, 1897, and in international transactions and in the customhouse it alone is accepted, though in the country debased silver coins and the depreciated paper currency are all the money that is in circulation. The silver circulating on March 31, 1899, was estimated at \$2,200,000; old bank notes, \$600,000; the new note issue, \$3,600,000. It was attempted without success to raise a foreign loan of \$1,375,000 for the redemption of the paper currency, and subsequently more bank notes were issued. The financial difficulties of the new Government prevented President Jimenez from instituting the reforms that the people hoped for. A new arrangement was made with the Santo Domingo Improvement Company for the liquidation and readjustment of the debts of the Government. The Congress approved the contract in April, 1900. Belgian bondholders objected to it on the ground that it deprived them of the lien on a part of the customs duties that they possessed as security for their bonds. In De-

ember the National Bank failed, which by the authority of Congress had issued all the paper money with which the country was flooded, and for the redemption of which the Government was responsible. A change in the Cabinet followed this new development of the crisis, Señor Hernandez becoming Secretary of the Interior; Señor Cuello, Secretary of War; Señor Brache, Secretary of Finance; Señor Despradel, Secretary of Agriculture; and Señor Joubert, Secretary of Posts and Telegraphs.

The Army and Navy.—The permanent army is employed to garrison Santo Domingo and the provincial capitals—Azua, Macoris, Samana, Puerto Plata, Santiago, Moca, La Vega, and Victoria—a regiment in each place.

The naval force consists of the gunboat *Independencia*, of 350 tons, armed with 5 Hotchkiss and 3 revolver guns; *El Presidente*, of 888 tons, carrying 9 guns; and the *Restauracion*, of 1,200 tons, carrying 9 guns.

Commerce and Production.—The chief products are sugar and coffee. The coffee plantations have increased, and cacao has been planted with success; tobacco, too, by the Cubans, and bananas with American capital. The rearing of cattle is another new industry. Over 85 per cent. of the land is suitable for cultivation, and a considerable area is covered with forests, which are profitably exploited. The high duties retard foreign commerce. The total value of imports in 1898 was \$1,696,280. Exports amounted to \$5,789,997. There were exported 49,300 tons of sugar, 929,980 feet of mahogany, 7,535 tons of tobacco, 2,616,908 pounds of coffee, 7,578,438 pounds of cacao, 2,182 tons of logwood, and 469,000 bunches of bananas, and in addition to these staples hides, honey, beeswax, divi-divi, and rum. The chief trade is with the United States and the islands of the West Indies, but with Germany, England, Spain, and France there is also considerable. During 1898 there were 554 vessels entered at the port of Santo Domingo and 380 cleared. In 1899 the value of imports was \$1,867,702; of exports, \$4,539,185. Iron, copper, and coal exist in Santo Domingo, but are not worked. Salt is mined profitably, and other minerals are found. Gold has always been obtained in dust and nuggets from the beds of streams in the Yague valley and elsewhere.

Railroads, Posts, and Telegraphs.—The railroad from Sanchez, on Samana Bay, to La Vega, 62 miles, is being extended to Santiago, 54 miles having been built. Another line is to be built from Barahona to Cerro de Sal, the salt mountain.

The number of letters, newspapers, etc., dispatched through the post office in 1897 in the internal service was 342,081, and in the international 286,051; in 1898, in the internal service, 396,946, and in the international 238,897.

The telegraph lines constructed by the Antilles Company have a total length of 430 miles, connecting with the French cable.

SERVIA, a kingdom in southeastern Europe. The legislative body is a single chamber called the Skupshchina, composed of 198 members, elected by all male Servians who pay 15 dinars of direct taxes. The reigning King is Alexander I, born Aug. 14, 1876, who succeeded to the throne abdicated by Milan I, his father, on May 6, 1889, and on April 13, 1893, dismissed the regents, and assumed the kingly authority. The ministry constituted on Oct. 23, 1897, and with some changes still in office at the beginning of 1900, was composed at the later date as follows: President of the Council and Minister of Foreign Affairs, Dr. Vla-

commendation of a book published by Hinton R. Helper, entitled *The Impending Crisis of the South—How to Meet It*, the sentiments of which were declared by many Democrats to be hostile to the peace and tranquillity of the country. Mr. Sherman would not retract his approval of the work, and so the prize fell to other hands, but he was made chairman of the Committee on Ways and Means, the highest place in the gift of the Speaker.

The next session there was an imperative need of more revenue, and a bill for that purpose was introduced by Mr. Morrill, of the committee, who had been largely instrumental in its preparation, but the opponents of the measure succeeded in getting it so loaded down with amendments that Mr. Morrill became disgusted and was willing to abandon it. At the instance of the committee, Mr. Sherman took charge of the bill, and by his superior knowledge of the rules and by masterly tact he forced it through the House in form substantially as originally reported from the committee, much to the chagrin of its opponents. The bill became a law practically unchanged. It was distinctively a bill for protection, and along its lines all subsequent protective tariff measures have been formed.

In 1861 Mr. Sherman entered the Senate, and was accorded second place on the Finance Committee at the solicitation of Senator Fessenden, its chairman, a most unusual recognition, as a new member, if placed at all on an important committee, is generally assigned to the bottom of the list.

The country was now in the throes of civil war, and, pressed for means to carry it on, the House passed a bill providing, among other measures, for the issue by the Government of \$150,000,000 of notes for circulation payable to bearer, but at no fixed time, and made a legal tender for all debts, public and private. When the bill reached the Senate Finance Committee it met with much opposition, Mr. Fessenden being bitterly opposed to the legal-tender feature. At the suggestion of Mr. Sherman the bill was amended by excepting from the legal-tender property of the notes the payment of customs dues and interest on the public debt, and, thus amended, the bill became a law—the most far-reaching measure ever entered upon the pages of our national statutes, touching as it did every business interest and the pocket of every individual in the country. The "legal tenders" are now popular notes, serving well the purpose of circulation; but without the Sherman amendment not a prop would have been left to support the nation's credit.

A year later Mr. Sherman introduced and carried through a measure for the creation of national banks, the notes of which were to be secured by a collateral deposit of public bonds. This measure had been twice recommended by the Secretary of the Treasury in his annual reports, but had not been favorably received. These notes were designed to supplant the State bank issues, which were then in a most unhappy condition. Out of 1,230 State banks issuing notes, 140 were broken, 234 closed, and 131 worthless. At the same time there were in circulation 3,000 kinds of altered and 1,700 varieties of spurious notes, 460 of imitations, and more than 700 of other kinds more or less fraudulent. The substitution of national bank notes, as the measure provided, in place of the obnoxious State bank notes which were then in circulation, marks an epoch in the country's history—a putting off of the old and a putting on of the new in the growth of the nation.

When the civil war was at an end, the problem of restoring the seceded States to their former places in the Union demanded solution. Congress, owing to diversity of views among its members, drifted along aimlessly. Presidents Lincoln and Johnson essayed reconstruction by proclamation, extending their invitations to the white men only. Several States had reorganized thereunder and were awaiting congressional recognition when the ill treatment of the freedmen and the outrages of the Ku-klux Klan, in several sections of the South, aroused the North and united the Republican party. On Feb. 6, 1867, Mr. Stevens, of the House, reported a bill which set forth that the rebel State governments were instituted without the authority of Congress and the sanction of the people; that these pretended governments afforded no protection to life, liberty, or property; that they encouraged lawlessness and crime, and that peace and order ought to be enforced until loyal State governments could be legally established, and therefore the bill made provision for strengthening the administration of the military government existing throughout the seceded States. After considerable debate the bill unchanged passed the House. In the Senate the measure was bitterly denounced as a declaration of war against the seceded States, and several amendments were offered but were voted down. Mr. Sherman, after consulting with a few of his friends, brought forward an amendment, which he offered as section 5 to the bill under consideration, saying in explanation: "In regard to the fifth section, which is the main and material feature of this bill, I think it is right that the Congress of the United States, before its adjournment, should designate some way by which the Southern States may reorganize loyal State governments in harmony with the Constitution and laws of the United States and the sentiments of the people, and find their way back to these halls. My own judgment is that that fifth section will point out a clear, easy, and right way for these States to be restored to their full power in the Government. All that it demands of the people of the Southern States is to extend to all their male citizens, without distinction of race or color, the elective franchise." The discussion that followed was extremely acrimonious, and it was freely predicted that the enactment of the bill into a law would be the death knell of the Republican party. The bill, however, carrying Mr. Sherman's amendment, passed the Senate, and became a law unchanged, over the veto of President Johnson, March 2, 1867. Under the provision of its fifth section, ten States were restored to the Union as anticipated by Mr. Sherman, and suffrage was given to 600,000 freedmen.

While visiting Paris in 1867, Mr. Sherman received at his hotel a request from the Monetary Conference, then in session in that city, for an expression of his views on a proposition so to change the weight of the English sovereign and our gold dollar as to make them multiples in value of the French gold franc. Mr. Sherman immediately replied, approving, and incidentally discussing the theory of a double standard, exposing in strong terms what he believed to be its fallacy. Later he made a report from his committee on the project that had engaged the attention of the conference, in which he renewed his objections to any attempts at operating a double standard, assuming that the gold unit, which had been in use since 1834, would continue indefinitely as the standard of this country. The Senate was favorable to changing the weight of our gold dollar as proposed, but England objected

Railroads, Posts, and Telegraphs.—The railroads completed up to the end of 1899 had a total length of 554 miles, consisting of the Servian section of the trunk line to Constantinople, 230 miles, and several branches. An extension of one of them from Nisch to join a Roumanian road by a bridge across the Danube was arranged in 1898, and one is authorized to run from Nisch to the Turkish frontier to join a line to be constructed through Albania to the Adriatic. Ten others are projected as feeding lines. The cost of the existing railroads was 98,955,980 dinars.

The post office carried 12,844,000 internal letters and 410,000 internal money letters and postal orders amounting to 117,114,000 francs in 1899, and in the external service 3,933,000 ordinary letters and 191 money letters and postal orders amounting to 60,437,000 francs, besides 1,666,000 ordinary letters and 71,000 letters and orders remitting 31,179,000 francs in transit.

The telegraphs have 2,562 miles of line and 5,041 miles of wire. The number of messages in 1899 was 1,078,420, of which 901,929 were internal, 155,298 international, and 21,193 in transit. The postal and telegraph receipts were 2,242,802 dinars, and the expenses 1,400,425 dinars.

Change of Cabinet.—King Alexander, by announcing his intention to marry a civilian lady, a Servian subject, Mme. Maschin, not only disappointed his father, who resigned his post as commander in chief of the Servian army, and vexed his mother, but caused much dissatisfaction at first in Servia. His ministers resigned, and on July 25 the King appointed a neutral Cabinet, as follows: President of the Council and Minister of Foreign Affairs, Alexa Jovanovich; Minister of the Interior, Lazar Popovich; Minister of Justice, Nastas Antonovich; Minister of Finance, Dr. Mika Popovitek; Minister of War, Lieut.-Col. Milos Vassich; Minister of Public Works, Col. Andreas Jovanovich; Minister of Commerce, Dusan Spasich; Minister of Worship and Public Instruction, Paul Manichovich. The new ministers were judges, departmental chiefs, and army officers who had no party ties. A partial amnesty for political offenses was proclaimed, those who had been sentenced to hard labor having their sentences commuted to simple imprisonment and those who were condemned to imprisonment having their sentences reduced. The defection of most of his prominent and influential supporters, who were identified with the Austrophil policy instituted by King Milan, drove the young King to seek friends rather among the Radicals, to whom his choice of a Queen from among the people was not displeasing, and by drawing nearer to the Radicals, who have always leaned toward Russia, he attracted the good will of the Czar, who hastened to congratulate him on his approaching marriage. Draga Maschin, born Sept. 23, 1867, was the daughter of a Servian magistrate and the widow of a surgeon in the army, and had formerly been a lady in waiting at the court of Queen Natalie. The royal marriage took place on Aug. 4.

SHERMAN, JOHN, an American statesman, born in Lancaster, Ohio, May 10, 1823; died at his residence in Washington, D. C., Oct. 22, 1900. Mr. Sherman came from the noted Connecticut family of that name, the most noted of whose members in colonial days was the stern Puritan Roger Sherman. His father, Charles Sherman, of Norwalk, Conn., married Mary Hoyt, of that place, in 1810, and they immediately emigrated to Ohio, then a frontier State, a large portion of its territory being an unbroken wilderness. He died in 1829, leaving eleven children, of whom William Tecumseh, who became the famous gen-

eral, was the fourth, and John, the subject of this notice, the eighth. The family was left with but scant resources, and soon scattered, John going to live with a relative at Mount Vernon, Ohio, where he attended school three years, when he returned to Lancaster and entered an academy, studying mathematics, in which he became proficient. Becoming impatient of the restraints of school, after two years of academy life he secured a place, though hardly fourteen years of age, as junior rodman in a survey then being made of Muskingum river from Zanesville to Marietta. In this work he remained about two years, when he was turned adrift on account of politics. It was then arranged that he should study law with his brother Charles at Mansfield, but, as he could not be admitted to the bar until he was twenty-one, he read meanwhile much of history, especially that of the United States, travels, and general literature, writing deeds and contracts, later dabbling in politics and looking after cases arising in the office, and earning enough to pay his expenses. His admission to the bar changed the course of his life but little. Mansfield was his home for the rest of his life. His interest in politics grew with his years, and in 1848 he was appointed a delegate to the Whig National Convention that nominated Zachary Taylor for the presidency, and in 1852 he was a delegate to the Baltimore Convention that nominated Gen. Scott as presidential candidate. Two years later he became a candidate for Congress as a Whig, and was elected.

Hardly had he familiarized himself with his new surroundings when he became conspicuous as a staunch opponent of the scheme to extend slavery over the Territories. Before the end of his first term, by direction of the House, a committee of its members, of which Representative Howard, of Michigan, was chairman, investigated the turbulent conditions in the Territory of Kansas, where the importation of slaves from Missouri (consequent on the repeal of the Missouri compromise) was being strenuously opposed by the settlers from the free States. Mr. Howard became ill, and Mr. Sherman, second on the committee, wrote the report thereon, which was widely circulated, and became the substance of the creed of the Republican party then crystallizing into form out of the disintegrating elements of the two old parties, both of which were seeking to avoid the impending storm. The Buchanan administration, which followed, if not friendly to slavery, was opposed to taking any steps to prevent its spread into the new Territories, a policy satisfactory to the slave owners. The debate in Congress on this matter became very angry. Mr. Sherman, to checkmate the moves of the administration, offered an amendment to the army bill then pending, which was adopted, providing that the United States troops should not be used to enforce any of the enactments of the so-called Legislature of Kansas which had been organized in the interest of the proslavery settlers. This measure thwarted for a time the purpose of the administration, but it served to inflame the discussion on the floor of the House, where the tall form of Mr. Sherman became the rallying point for the adherents of the new party, who began to align themselves for the impending struggle which could not be long deferred, and which was destined in the end not only to give freedom to Kansas, but to uproot the institution of slavery in the States where it already existed. On the opening of Congress in December, 1859, Mr. Sherman lacked but three votes of being elected Speaker, and these were withheld because of his

D. Appleton & Co. N.Y.

Mr. Sherman

to the slight change in the weight of her gold sovereign, and for this reason nothing came of the scheme.

In view of Mr. Sherman's opposition, as stated in the letter and report mentioned, his action in 1873 in pressing through the Senate the coinage act, by which the gold dollar was permanently made the standard of value and the unit of account in the United States, and no further authority given for the issue of the silver dollar, needs no explanation.

In 1869 Mr. Sherman was made Chairman of the Senate Committee on Finance, in place of Mr. Fessenden, who had resigned from the Senate, which place he held until called to the Treasury in 1877. Meanwhile a great clamor had arisen for payment of the public obligations in legal tenders, the kind of money the Government received for them when they were issued. The law controlling their payment was not explicit on this point, but Mr. Sherman argued that, waiving all technicalities, by making the bonds payable without question in coin their value would be so appreciated that as they matured the Treasury would be able to refund them at par at a lower rate of interest, and the saving therefrom would be greater than any possible gain from forcing their payment in the depreciated notes, and at the same time there would be no opportunity for an imputation of repudiation. To that end he reported a bill, which became a law March 18, 1869, explicitly declaring the bonds payable in coin. Experience justified the policy urged by Mr. Sherman, the bonds being subsequently refunded with much advantage, and the credit of the country greatly strengthened.

In 1873 the country suffered from a financial panic arising from the unsatisfactory condition of the paper currency, and relief in some way was urgently demanded. Mr. Sherman urged that provision should be made for redemption in coin of the legal-tender notes, thus increasing the circulation of the country to the extent of the hoarded gold, which would then doubtless come into use and stimulate business; but the plausible advocates of paying the bonds in depreciated paper demanded stoutly that, instead of such redemption, there should be a further issue of the notes, and they were able to get a measure to that end through Congress. It was promptly vetoed, however, by President Grant, and this gave Mr. Sherman an opportunity to press his scheme of relief. At his instance, a Republican caucus directed him to present to the Senate and put upon its passage a bill authorizing the Secretary of the Treasury to use the surplus revenues of the Government, and to sell bonds for gold as necessary, with a view to the accumulation of a fund to enable him to redeem at the New York sub-treasury all United States notes presented for that purpose on and after Jan. 1, 1879. The bill became a law Jan. 15, 1875, Mr. Sherman being the only man in either house that spoke in its favor. The bill was not popular, and its enactment was received with little approval in any quarter. Even the friends of resumption doubted its sufficiency to bring about that result. When, two years after its passage, Mr. Sherman became Secretary of the Treasury, the premium on gold had not much diminished, and no steps had been taken by the officers of the Treasury toward accumulating the required reserve for resumption. Mr. Sherman lost no time in forecasting his policy. From a syndicate of bankers subscribing under a contract for bonds for refunding, he obtained, in the spring, permission to retain \$15,000,000 of gold for the resumption

reserve, and soon thereafter \$25,000,000 more from the same parties for a like purpose. Adverse conditions prevented for a while further accumulations. There was little faith, even among his party friends, that the needed gold could be obtained. Congress gave no encouragement, and called him before one of its committees. In response to an inquiry from a member of the House as to what he proposed to do about resumption, Mr. Sherman replied that, unless the law should be repealed, he should redeem the notes in coin as directed; that as Secretary of the Treasury he had no other alternative; and, as far as he deemed prudent, he explained where the necessary gold could be found, and how he proposed to obtain it. Four days later he had secured \$50,000,000 of gold by the sale of bonds above the market price, and resumption was assured. On Jan. 1, 1879, the gold premium had disappeared; gold was offered for the notes, but nobody wanted it, just as Mr. Sherman had predicted. With resumption came the promised relief. Capital, assured of its return in money of equal value, sought investment; labor found employment, and throughout the land every hearth rejoiced in the nation's prosperity.

Incidentally, Mr. Sherman, during his term in the Treasury, greatly reduced the annual interest payment on the public debt by funding more than \$800,000,000 of the war bonds at a lower rate of interest; but his crowning work was the resumption of specie payments, the good effects of which still continue, giving the nation honor and credit throughout the world.

Consequent upon Mr. Sherman's successful administration of the Treasury from 1877 to 1881, his friends brought him forward as a Republican candidate for the presidency at the conventions held in 1880 and 1888, and in both instances he received a strong support.

Upon the change in administration, Mr. Sherman in 1881 returned to the Senate, where he was made Chairman of the Committee on Foreign Relations, from which place he resigned in 1897 to become Secretary of State. But, failing in health, after a short time he returned to private life. He published his *Recollections* (2 vols., 1896) covering the period of forty years in which he was a prominent actor in the drama of American history.

In announcing Mr. Sherman's death, President McKinley said: "In the fullness of years and honors John Sherman, lately Secretary of State, has passed away. Few among our citizens have risen to greater or more deserved eminence in the national councils than he. The story of his public life and services is, as it were, the history of the country for half a century. In the Congress of the United States he ranked among the foremost in the House and later in the Senate. He was twice a member of the executive Cabinet, first as Secretary of the Treasury, and afterward as Secretary of State. Whether in debate during the dark hours of our civil war, or as the director of the country's finances during the period of rehabilitation, or as a trusted counselor in framing the nation's laws for over forty years, or as the exponent of its foreign policy, his course was ever marked by devotion to the best interests of his beloved land, and by able and conscientious effort to uphold its dignity and honor. His countrymen will long revere his memory and see in him a type of the patriotism, the uprightness, and the zeal that go to molding and strengthening a nation."

SOUTH AFRICAN REPUBLIC. See TRANSVAAL.

SOUTH CAROLINA, a Southern State, one of the original thirteen, ratified the Constitution May 23, 1788; area, 30,570 square miles. The population, according to each decennial census, was 249,073 in 1790; 345,591 in 1800; 415,115 in 1810; 502,741 in 1820; 581,185 in 1830; 594,398 in 1840; 608,507 in 1850; 703,708 in 1860; 705,606 in 1870; 995,577 in 1880; 1,151,149 in 1890; and 1,340,316 in 1900. Capital, Columbia.

Government.—The following were the State officers in 1900: Governor, Miles B. McSweeney; Lieutenant Governor, R. B. Scarborough; Secretary of State, Marion R. Cooper; Treasurer, W. H. Timmerman; Comptroller, John P. Derham; Attorney-General, G. D. Bellinger; Superintendent of Education, John J. McMahan; Adjutant General, J. W. Floyd; Railroad Commissioners, Messrs. W. D. Evans, Wiborn, and Garris; Phosphate Inspector, S. W. Vance; Dispensary Commissioner, H. H. Crum; Directors of the Dispensary, Leon J. Williams, H. H. Evans, and A. F. H. Dukes; Chief Justice of the Supreme Court, Henry McIver; Associate Justices, Eugene B. Gary, Ira B. Jones, and Y. J. Pope; Clerk, U. R. Brooks. All are Democrats.

The State officers are elected in November of the even-numbered years, for terms of two years. The Legislature meets annually in January. It consists of 41 Senators and 124 Representatives.

Population.—The Federal census gives the following returns by counties: Abbeville, 33,400; Aiken, 39,032; Anderson, 55,728; Bamberg, 17,206; Barnwell, 35,504; Beaufort, 35,495; Berkeley, 30,454; Charleston, 88,006; Cherokee, 21,359; Chester, 28,816; Chesterfield, 20,401; Clarendon, 28,184; Colleton, 33,452; Darlington, 32,388; Dorchester, 16,204; Edgefield, 25,478; Fairfield, 29,425; Florence, 28,474; Georgetown, 22,846; Greenville, 53,490; Greenwood, 28,343; Hampton, 23,738; Horry, 23,364; Kershaw, 24,696; Lancaster, 24,311; Laurens, 37,382; Lexington, 27,264; Marion, 35,181; Marlboro, 27,639; Newberry, 30,182; Oconee, 23,634; Orangeburg, 59,663; Pickens, 19,375; Richland, 45,589; Saluda, 18,966; Spartanburg, 65,650; Sumter, 51,237; Union, 25,501; Williamsburg, 31,685; York, 41,684.

The population of Charleston is 55,807; in 1890 it was 54,955.

Finances.—The report of the Comptroller, submitted in January, gave the following statements: Cash balance in the treasury, available for expenses of the State government in 1900, \$129,574.96; to this amount add uncollected taxes of 1899, \$625,000; insurance license fees, Comptroller General's Office, \$12,000; additional insurance licenses, \$13,000; fees of Secretary of State's office, \$5,000; total, \$784,524.96. The estimated expenses of the State government for 1900 were \$906,518.90, leaving \$121,943.94, which must be paid from the taxes of 1900. From insurance companies \$12,025 was collected in annual license fees, and paid into the State treasury. The sum of \$13,635.14 was realized from additional license fees.

The Legislature appropriated \$283,832.51 for interest on the State debt.

The report of the dispensary for 1899 showed the total net profits to be \$414,181, of which the towns and cities received \$220,492, and the State \$193,689. The school fund received \$100,000 of this sum. The effect of the new law, it is said, will be to give the cities and towns more of the profits, and reduce the share of the school fund to about \$75,000. An act of the Legislature provides that each school district in the State, where the sum realized from the 3-mill tax and the poll tax is not sufficient to give \$75 to each school in the district, shall have the deficiency made up

to it by the Comptroller from the dispensary profits.

The State has 4 classes of claims against the Government, arising from the several wars. The Revolutionary War claims aggregate far the largest sum, amounting, with interest, to \$316,947.75. The United States holds bonds of the State issued in 1856 to complete the Statehouse—\$125,000 principal and \$123,750 interest. They matured in 1881. Suit was brought in the United States Supreme Court in June to recover the amount, but it was afterward found that the act requiring the suit to be instituted had been repealed nineteen days before the suit began, and notice was given that on the opening of the court in October a motion would be made by the Attorney-General to have the case dismissed. The United States holds a claim against the State for \$340,479.89, for the value of ordnance stores belonging to the Government, which were seized by order of Gov. Pickens in December, 1860, after the adoption of the ordinance of secession, recently described in a Charleston paper as "the obsolete cannon, round cannon balls, and muzzle-loading muskets, and paper cartridges of one ball and four buckshot that were stored away in the United States arsenal in Charleston, or picturesquely arranged about the grounds of that famous armory."

The legality of the act of the Legislature appropriating \$175,000 from the sinking fund to complete the Statehouse was questioned, but the Attorney-General decided that the commissioners had no responsibility but to obey the Legislature, and the contract for the work was let in August.

Valuations.—From the returns of assessments in October it appears that the valuation placed upon real property amounts to \$102,137,777, and that upon personal property to \$53,120,863. Railroad property is valued at \$27,771,973. The total, \$183,030,613, shows a considerable increase over the total of 1899, which was \$176,432,288.

Education.—The Superintendent's report has the following general information regarding the schools, together with recommendations for manual training, especially in negro schools:

"The best proof of interest in education is the willingness to bear an extra local burden. The number of extra levies made this year, although not available for publication in this report, is known to be remarkable. Many districts have tried to make this levy and failed by only a few votes. That town is an exception that has not for some years borne an extra tax and maintained an efficient system of graded schools, and this year's record has considerably reduced the number of exceptions. We have 3,000 white teachers and 2,000 negro teachers in this State, many of them poorly fitted for their work. The normal colleges in the State can not in this generation supply even a considerable proportion of teachers to take the places of those now in the schools.

"The statute now secures too great a privilege to the holder of a nominal college diploma. This has encouraged high schools to charter themselves as colleges and secure an advantage over academies that are more efficient and more honest. But from good colleges come graduates that are no credit to them.

"Many districts and some entire counties are behind in their school funds a year or more. The teachers are paid with warrants that are cashed by banks at a discount, in some cases, of 1 per cent. a month. A few county superintendents have lately brought their schools to a cash basis by careful management, setting aside a part of the funds each year so as to accumulate a sinking fund."

The State Board of Education, appointed in April, is constituted as follows: Henry P. Archer, Graves L. Knight, J. L. McCain, H. T. Cook, A. R. Banks, W. A. Brown, and T. M. Raysor. Under the law the Governor is chairman and the State Superintendent secretary. The board has adopted a set of text-books by Southern authors; the United State history is one approved by Confederate veterans.

At Clemson, the Agricultural College, 463 students were in attendance in September. Many applicants were turned away for want of room. The textile department, lately added, has met with approval and success. A new chemistry building and a new electrical laboratory are provided for, but all departments need enlarged room and equipment. Clemson receives the proceeds of the tax on fertilizer taxes.

The Citadel Military College graduated 18 students; Erskine College, at Due West, 20; the college for women at Columbia, 6; Furman University, at Greenville, 26.

The increased attendance at the South Carolina College made it necessary to add 4 teachers to the faculty. At the opening in September, 190 students were enrolled. The degree of Bachelor of Arts was conferred upon 20 students in the summer, and that of Bachelor of Laws upon 12. The college will celebrate the centennial of its organization in December, 1901.

The State College for Girls, at Winthrop, had 353 in the regular classes at the beginning of 1900. There were 23 graduates in the four years' course. The college received from State funds \$33,000 for completing the buildings, and \$5,450 for scholarships.

A bequest of \$100,000 was made by the late James Gibbes for an art school in Charleston, provided \$50,000 additional is raised; but its legality is to be contested. The point of the contest which chiefly threatens the bequest is that of the school being open to both races or not opened for either. The State Constitution provides that the races shall be educated separately, and the Federal Constitution declares that there shall be no distinction on account of race. The will provides for only one school.

Convicts.—The report of the directors of the Penitentiary, submitted in January, shows that there was a balance, Jan. 1, 1899, of \$4,804.44. The total receipts during 1899 were \$63,518.23, making a total of \$68,322.67. The total expenditures for 1899 were \$58,436, leaving cash on hand Jan. 1 of \$9,886.67. The profit from the State farms was \$7,580. The superintendent's report shows 784 convicts at the close of 1899. Two hundred and seventy-two were sent in the year, 17 escapes were recaptured, making the total for the year 1,073. The number in confinement now is 801. The general health is good, but the surprising statement is made that 16 out of 41 died of tuberculosis, and 8 with cerebro-spinal meningitis. In the debate in the Senate on the bill, which passed, to establish a reformatory for young criminals, one of the Senators "declared that it was an outrage that such a condition of affairs exists as can now be seen in the Penitentiary. Hundreds of prisoners can not walk without a limp, and it is simply because their feet or limbs have been frozen." In reply to a question, he said that the superintendent had told him that many men had frozen feet. The stalls (cells) in which the convicts are compelled to stay thirteen hours are unfit for his horse to be stabled in. He declared that convicts were given a certain task, and when they did not do that, and even more, they were warned of what they would get—a whipping.

Work on the new prison had progressed so far at the close of the year that it was expected to be ready in January. The reformatory was opened late in the year to receive the 20 boys transferred from the Penitentiary.

Militia.—The organized strength of the militia was given in July as 2,653; the number of men liable for service, but unorganized, as 100,000. The State's share of the Government appropriation for militia will be about \$20,000.

Railroads.—In 1899 123 miles were added to the tracks in the State, and 86 in the six months ending June 30, 1900. The building of short connecting lines between main lines is going on in many parts of the State. The total mileage is 2,830.44. The taxes amounted to \$341,000. The gross earnings of the principal roads of the State, as reported, amounted to \$8,916,384.

Industries and Products.—A report made in March showed that 26 new corporations, most of them asking charters for cotton mills, had filed declarations, and 5 others for increases of capital, making a total of new capital of \$4,890,000. Four cotton-seed-oil mills were closed on account of the high price of seed, \$20 a ton.

The cotton acreage this year was given as 2,075,661, an increase of 112,961 over that of 1899. The cotton blight has made hundreds of acres of the finest sea-island tile-drained lands unfit for the production of cotton. Although this disease has appeared on all the islands and in Christ Church parish, its effect is far more extended on James island. The tobacco crop is 20,000,000 to 25,000,000 pounds annually.

The report of the Phosphate Inspector shows the condition of that industry to be better than it has been for several years.

The number of tons of rock mined in 1898 was 99,315; in 1899 it was 121,073; in 1898, 94,008 tons were shipped, in 1899 134,094. The royalties paid on this to the State amounted to \$34,928.69.

The commercial crop of cotton of the season was given as 921,000 bales; the consumption in mills of the State, 497,496 bales; the number of spindles, 1,794,657.

Exposition.—Preparations are making for the South Carolina Interstate and West Indian Exposition, to be held in Charleston beginning Dec. 1, 1901, and continuing five months.

The Naval Station.—This is to be removed from Port Royal to Charleston. In recommending the removal Admiral Endicott wrote: "To make the Port Royal station accessible for the larger vessels of the navy at all times of the day would involve a very large outlay for dredging, and to complete the deep-water basin immediately in front of the basin, where vessels can be moored and lie afloat at low tide, which is now under construction, would cost probably \$500,000, in addition to the \$200,000 already appropriated. As no commercial city is reached through this harbor, this work would be solely for the naval station, while at Charleston such interests are calling for deeper and deeper navigation to the sea, and such improvements would directly and largely benefit the commercial world through the commercial metropolis of the State."

Lawlessness.—Two riots occurred at polling places at the August primary. At Midway, Bamberg County, 1 man was killed and 2 mortally wounded, and at West Duncan, Greenville County, 1 man was killed and 2 severely injured.

A negro, for an assault and attempt on the life of a white woman, was lynched near Ninety Six, Greenwood County, in February.

Citizens of Neecees, in Orangeburg County, telegraphed to Columbia in March, begging for troops

to protect them from white regulators, who had twice visited the town, beaten people, white and black, and promised to return and kill them. Work on the surrounding farms had been stopped, and people driven from their beds.

A trial at Orangeburg to collect damages from the county for a lynching, under the law that allows such damages to be collected by the legal representatives of the victim, resulted in a verdict for the county, which was set aside, and a new trial was had, with the same result. It is not deemed possible to enforce the law, but it is said that its effect has been to decrease the number of lynchings.

Historical.—Among some rubbish in the office of the Secretary of State was found in January a veneered wooden case about 3 feet long by 2 feet wide, and printed upon the top was "Proceedings of the Convention, 1832-'33. Secretary of State's office." On opening it, he discovered the original ordinance "To nullify certain Acts of the Congress of the United States," as it was engrossed and signed by the members of the convention, the original ordinance as it was drawn up and presented to the convention, Chancellor Harper's original draft of the ordinance, a certified copy of President Jackson's proclamation as printed, and a certified copy of Gov. Robert Y. Hayne's proclamation in reply as printed in the Columbia Telescope, the manuscript journals of the conventions for 1832 and 1833, both beautifully bound, and 2 printed copies of the same journals, and the original ordinance rescinding the first ordinance.

One of the flags carried in the Mexican War by the Palmetto regiment was turned over to the State in April, together with what is left of the regimental records. These and the 2 flags were sent from Columbia to Chester at the time of Sherman's march. The State flag was lost; the army regulation flag is the one just brought back to the Capitol. It passed through 4 battles of the Mexican War, and 5 officers were shot down while carrying it—2 mortally wounded. It went to Cuba in 1898 with the Second Regiment of South Carolina infantry. The "Jackson vase" was also sent by the survivors of the Mexican War to the Capitol.

The Columbia Chapter of the D. A. R. have placed in the State Capitol a marble tablet to the memory of Emily Geiger, a Revolutionary heroine, who in 1781 took a perilous ride of more than 100 miles through forests and across rivers to carry a message from Gen. Greene to Gen. Sumter. She memorized the written message given to her, and, when taken on suspicion before Lord Rawdon, tore up and swallowed the paper secretly, so that nothing was found when she was searched, and she was allowed to go on her way. The result was that Gen. Sumter joined Gen. Greene as he was desired by the message, and Ninety Six, the most important point in upper Carolina held by the British, was evacuated, and Lord Rawdon was compelled to retreat to Orangeburg. It was desired to mark her grave with a monument, but its place could not be found.

Walhalla celebrated its semicentennial this year. A monument to the memory of Gen. John A. Wagener, founder and president of the German Colonization Society, was unveiled.

Legislative Session.—The Legislature met for the annual session Jan. 9, and adjourned Feb. 17. Frank B. Gary was Speaker of the House.

Associate-Justice E. B. Gary was re-elected. The number of acts and resolutions passed was 188. The Governor sent a special message asking

for legislation providing for the draining of the swamp lands of the State, and a resolution was passed for submitting to vote, in November, a constitutional amendment giving the Legislature power to provide for condemnation proceedings and assessment of lands drained. Another constitutional amendment proposed was one providing that the 8-per-cent. limitation as to the proportion of bonded indebtedness a town may assume should not apply to Charleston, Columbia, Rockhill, and Florence, if bonds are issued only to provide water and sewerage, nor to Georgetown, if they are only for water, sewerage, and light. These were voted upon in November and carried; but they take effect only after being ratified by the Legislature of 1901.

A proposed amendment changing from annual to biennial sessions passed the House, and lacked but one vote in the Senate. One extending the term of members of the Legislature to four years was proposed and lost.

Changes were made in the dispensary law. The Board of Control was abolished, and a board of three directors elected by the Legislature is to have charge, with the assistance of a commissioner. They are removable by the Governor. The county boards of control, formerly chosen by the State board, are to be chosen by the delegations in the Legislature from their respective counties. The constables are to give bonds, and their names must be reported to the General Assembly, thus doing away with the secret service. The liquor is to be sold to the county dispensers at 10 per cent. above cost.

The State will hereafter insure its own buildings and county public buildings, except schoolhouses. Half the amount that has been paid for premiums will be paid to the commissioners of the sinking fund for an insurance fund. When the insurance fund reaches \$200,000, no further premiums will be paid except to maintain the fund at this amount. Foreign insurance companies are prohibited from taking insurance through unlicensed agents; policies must be countersigned by resident agents.

A reformatory for male convicts under sixteen was provided for. It is made a misdemeanor for sheriffs to neglect to arrest escaped convicts.

The Secretary of State may, on a majority vote of members, amend the charter of religious, educational, social, fraternal, or other associations not for profit. Regulations were made for the chartering of continuing building and loan associations.

Two bills affecting railroads became laws. One requires separate coaches for white and colored passengers, allows no second-class cars, and provides for a uniform charge of 3 cents a mile. Formerly the roads were required only to provide separate compartments in the coaches.

A law was made permitting homœopathic physicians to have an examining board of their own school, and creating such a board. Registration of births, marriages, and deaths is required by another act.

The military law was amended, and a new pension act was passed designed to restrict the pensions to those really needy. An appropriation of \$10,000 was made for a monument to South Carolina soldiers at Chickamauga, and the erection of a monument to the women of the Confederacy on the Statehouse grounds was authorized.

Several laws were passed, though none of the first importance, changing the common or statute law in the State at large.

Provision was made for completing the Statehouse, the money to be taken from the sinking

fund. The levy for county purposes was reduced to $\frac{1}{4}$ mill.

Other measures passed were as follow:

Providing that a mortgagee may pay a delinquent tax on all the property of the mortgagor, and add the amount to the mortgage debt.

Making partners liable for their own acts only after notice of dissolution has been given.

Providing for quarterly examinations by joint committees of the Legislature of the accounts of State financial officers.

Providing that fertilizers may be analyzed free of charge at Clemson College.

Authorizing Clemson College to build a railroad to connect the college with stations on other lines.

Giving the board of the South Carolina Military Academy power to confer the title of bachelor of sciences.

Requiring barbed-wire fences within 50 feet of a public highway to have planks along the top.

Providing for the completion of Winthrop College.

Making it a misdemeanor to sell or ship partridge or quail out of the State for five years.

Fixing the weight of a bushel of bolted cornmeal at 46 pounds; of unbolted at 48.

Requiring records and reports of criminal statistics.

Providing for the assessment of railroad property that has been escaping taxation, and for the collection of the taxes past due.

Granting to the United States title to and jurisdiction over certain lands on Sullivan's island.

A proposition to appropriate \$100,000 to the support of public schools came near passing, but was finally rejected by a vote in the Senate of 18 to 17. The institutions for higher education received appropriations: South Carolina College, \$27,000; Winthrop College, \$33,000, and \$5,450 for free scholarships; the State colored college, \$8,000; the Military Academy, \$20,000, and \$6,250 for deficiency and \$1,500 for a library; the Deaf, Dumb, and Blind Asylum, \$30,000.

The total of appropriations, not including the \$175,000 for completing the Statehouse (which amount is to be borrowed from the sinking fund), was \$954,571.76. It includes the appropriations for the interest on the State debt, the \$100,000 for Confederate pensions, the expenses for elections, the pay for the State officers, the support and special appropriations for the State colleges, the pay for the judiciary, the pay for the health departments of the State, and the monument at Chickamauga. The aggregate in 1899 was \$842,151.82.

Political.—State officers were elected in November. The Democratic ticket was the only one in the field. There was the usual speech-making campaign, beginning in June, the candidates for the office of United States Senator and for the nominations for State offices holding joint debates in the various counties before the primary elections, which took place Aug. 28 and Sept. 11. The chief issue was the State dispensary law; James A. Hoyt was the candidate for Governor of those favoring prohibition instead of the dispensary; Gov. McSweeney, F. B. Gary, A. H. Patterson, and the Rev. G. Walter Whitman were the other candidates.

The Republicans held a convention at Columbia, March 20, when four delegates to the national convention were chosen and instructed to vote for the renomination of President McKinley. The resolutions approved his administration, favored American shipping for our commerce, condemned lynching, and said: "We still protest against the suppression of the ballot of the citizens of South

Carolina by the criminal nullification of the Constitution and laws of the United States, enacted under the color of law by the so-called Constitutional Convention of 1895. And we contend that the unjust deprivation of 100,000 citizens of the State of their right of suffrage is a crime against the Government, which we call upon Congress to place the seal of condemnation upon, by enacting such laws as will protect the citizens of the United States in the highest right of citizenship—a voice in the selection of their public officers—and thus preserve in its purity the American doctrine that all governments derive their just powers from the consent of the governed."

A second Republican convention was held Oct. 3, but no State nominations were made.

The Prohibitionists held a conference Jan. 12, and issued an address to the people, in which was said: "Those who manage it say the dispensary paid last year \$130,000 to the education of the children of the State, but they did not tell the startling fact that the dispensary had drawn from the people of the State at least twenty times as much and spent it in fat salaries and other expenses, purchases, etc., of the liquor system. It may be said that in addition to the \$130,000, the counties and towns received a small sum each, and to this we reply: The expenses incurred by the counties and towns in the trial, punishment, and support of criminals, who have been made such by the liquor sold them by the State, will far more than balance the money received from the dispensary. We state it moderately when we say the present system of liquor selling is robbing the people of the State of \$20 for every dollar paid to the State Treasurer for educational purposes. The State Board of Control is sending out of our State each year at least \$1,000,000, and in exchange for it bringing into the State and distributing to our people five times the amount in poverty, wretchedness, disease, and death."

A convention was held May 23, at Columbia, and James A. Hoyt and James L. Tribble were nominated for Governor and Lieutenant Governor, to stand for nomination at the Democratic primaries, as there is a large body of Prohibition Democrats opposed to the dispensary.

The Democratic convention for electing delegates to the national convention met at Columbia, May 16. The resolutions favored the candidacy of Mr. Bryan and approved of Senator Tillman's course in the Senate. They also expressed sympathy with the Boers, and condemned the administration for "not extending an offer of its good offices to terminate the unholy war of subjugation." They denounced the imperialistic policy of the President and the financial policy of Congress, and the "hypocritical attitude of the Republican leaders, who abuse trusts and combines while they use the money obtained from them and stolen from the people to debauch the ignorant voters of the country."

At the first primary, Aug. 28, Gov. McSweeney received 39,097 votes and Mr. Hoyt 33,833. As these were the highest two, their names were voted upon at the second primary, Sept. 11, and the result stood: McSweeney, 51,363; Hoyt, 37,411. The ticket, as settled by the primaries, was: For Governor, M. B. McSweeney; Lieutenant Governor, James H. Tillman; Attorney-General, G. Duncan Bellinger; Secretary of State, Marion R. Cooper; Superintendent of Education, John J. McMahan; Adjutant General, J. W. Floyd; State Treasurer, R. H. Jennings; Comptroller General, J. P. Derham; Railroad Commissioner, J. H. Wharton.

There was no opposition to the candidacy of

B. R. Tillman for United States Senator, though the vote for him was 18,213 less than the total vote for Governor.

At the election in November the above-named ticket was chosen by a vote nearly as large as that for Mr. Bryan, who received 47,236 to 3,579 for President McKinley.

Two constitutional amendments were submitted and both were carried. They are given under Legislative Session in this article. For that on drainage, 21,339 voted yea and 9,917 nay; for that on bonded indebtedness there were 22,530 yeas and 8,108 nays. It was found, however, that an error had been made in the enrollment of the latter, the wrong number having been given to one of the articles to be amended, and the validity of its adoption was questioned.

SOUTH DAKOTA, a Western State, admitted to the Union Nov. 3, 1889; area, 77,650 square miles. The population, according to each decennial census since admission, was 328,808 in 1890 and 401,570 in 1900. Capital, Pierre.

Government.—The following were the State officers in 1900: Governor, Andrew E. Lee; Lieutenant Governor, John T. Kean; Secretary of State, William H. Roddle; Auditor, James D. Reeves; Treasurer, John Schamber; Attorney-General, John L. Pyle; Superintendent of Schools, E. E. Collins; Commissioner of Lands, David Eastman; Adjutant General, H. A. Humphrey; Mine Inspector, James Cusick; Oil Inspector, R. E. J. Meyer; Public Examiner, Maris Taylor; Insurance Commissioner, F. G. King; State Surveyor, William L. Bruce; Veterinarian, J. W. Elliott; Secretary Board of Charities and Corrections, G. W. Kingsbury; Secretary Board of Health, J. H. Jennings; President Board of Regents, H. H. Blair; Chief Justice of the Supreme Court, Dighton Corson; Associate Justices, Dick Haney, Howard G. Fuller; Clerk, Miss Jessie Fuller. Gov. Lee is a Populist; all the other elected officers are Republicans.

State officers are elected in November of the even-numbered years, for terms of two years. The Legislature meets biennially, in January of the odd-numbered years.

Population.—The State has gained 72,762 inhabitants, or 22 per cent., in the past decade. The number of Indians not taxed is 10,932. The census of the counties is incomplete, but that for the 6 Black Hills counties is: Butte, 2,907; Custer, 2,728; Fall River, 3,541; Lawrence, 17,897; Meade, 4,907; Pennington, 5,610.

Finances.—The Governor's message says the financial condition of the State is good. June 30, 1900, the Treasurer had a cash balance of \$555,701.48. The message criticises the policy that compels the State to pay 7 per cent. interest on registered warrants, while it receives no interest whatever on its funds deposited in banks, such interest, if any, being paid to the Treasurer as a personal perquisite and amounting possibly to \$12,000 or \$15,000 annually. There was a reduction of the State debt in 1900 of \$248,000. The net indebtedness, July 1, 1900, was \$540,811.09. The counties owe the State in delinquent taxes \$308,207.54. The defalcation of W. W. Taylor in 1895 is still unsettled, \$146,544.66 having been collected and \$220,842.64 being still due.

Valuations.—The total assessment of the State as compiled this year will be \$331,269,000. Of this amount, acre property is placed at \$101,720,620; town lots at \$181,100,798; merchandise, \$1,373,671; manufactures, \$755,002; horses, \$7,509,575; cattle, \$15,793,163; sheep, \$898,643; hogs, \$830,400; carriages and vehicles, \$1,112,659; moneys and credits, \$1,408,730; household furniture, \$1,054,340; stocks

or shares, \$1,512,282. The railroad companies are assessed at a total valuation of \$12,743,867; telegraph companies, \$187,575; telephone companies, \$174,181; express companies, \$113,500; and sleeping-car companies, \$10,000.

The tax levy of 2 mills for the general fund will furnish \$344,000 if collected in full.

Under a recent ruling of the Attorney-General, mortgages held by resident money lenders are to be assessed and taxed the same as other property.

Education.—The school population in 1899 was 116,278. The apportionment of the permanent school fund in December, 1900, gave 45 cents per capita. On a test case, brought in Mitchell, the court decided that the Board of Education had power to compel obedience to the order of the State Board of Health requiring vaccination.

In the Indian schools there was an enrollment this year of 3,946, and an average attendance of 3,430. A bill was introduced in Congress for building and maintaining an Indian industrial school at or near Evarts, in Walworth County.

The State University, at Vermillion, has had an unusually prosperous year. College presidents in conference decided upon two rules affecting athletics. "The striving of one college to attract athletes away from another institution by offers of any kind of compensation, it is believed, will be thoroughly rooted out by the passage of a rule debarring any student who has changed from one college to another from participating in inter-college contests for twelve months after date of such change. The other matter regarding which a rule is to be made is the number of hours of school work required per week. According to this rule, no student who does not pass in twelve hours of work a week will be allowed to enter inter-college contests."

Yankton College had an offer of an endowment of \$50,000 from Dr. Pearsons, of Chicago, on condition that the debt of \$30,000 should be cleared off, and that the institution should hereafter be kept free from debt. Friends of the college subscribed \$34,703, and in March the students celebrated the event with noise and blaze. Subscriptions from other States than South Dakota amounted to \$20,425. By commencement time the entire addition to the college funds had reached \$90,000. The expenses are about \$15,000 yearly.

The State Institution for the Blind was opened at Gary, March 1. During the first term 14 pupils were admitted, 2 of whom were from North Dakota.

Charities and Corrections.—The Insane Hospital, at Yankton, is overcrowded. The last Legislature appropriated \$70,000 for buildings. The laundry and the plant for light and power are completed, but the addition to the main building was still unfinished Nov. 1. The Northern Hospital for the Insane, at Redfield, the building for which was accepted in December, is designed for the feeble-minded. It is the finest public building in the State.

In the past two years there has been a decrease of 11 in the number of prisoners in the Penitentiary. July 1, 1898, there were 145 inmates. July 1, 1899, this had dropped to 130, while on July 1, 1900, the number was 134, showing an increase of 4 over last year but a decrease of 11 over two years ago. The total number of prisoners confined during the period July 1, 1899, to June 30, 1900, was 213. Only two of the convicts were women. The percentage of the life prisoners is greater than ever. In the year about 75 per cent. of the prisoners were employed during the day in the quarries outside the prison, getting out rough stone for new State buildings. The

value of the stone produced at the Penitentiary quarries and used in State buildings during the fiscal year ended June 30 was \$15,147.

Railroads.—In 1900 the railroad mileage in the State was increased by 136.66, divided among 4 lines. The valuation of the roads for assessment was \$12,753,867.

Banks.—Under the law for organizing national banks with capital stock of less than \$50,000, three have been organized in the State. The Yankton Savings Bank, which failed in November, 1899, had liabilities of \$32,000, of which \$8,000 was county funds. The State bank, at Plankinton, failed Jan. 9; Aurora County was said to have had about \$6,000 on deposit. The establishment of the first bank in Selby is described in a dispatch of Aug. 22: "The extension of the Chicago, Milwaukee and St. Paul, from Bowdle, has reached this town and is being pushed west by an increased force. The business buildings of Bangor are about half here, and the remainder will come before the week closes. A hot race occurred when the two banks started—the Farmers' and Merchants' and the Walworth County and State. They left Bangor about the same time. The latter had about a quarter of a mile the start and was much the lighter building, being but one story in height, while the Farmers' and Merchants' is 30 by 20 and two stories. The latter soon began to gain, and when about a mile and a half out passed the State bank and steadily increased the distance between them. The State people sent back for reinforcements, and soon added two more teams, making 12 horses in all. Then they began to gain steadily on the Farmers', who, seeing they would be losers unless help soon arrived, dropped the wagon in which they had the safe and added 4 horses to their 30-horse team. It was then an even thing for some distance, but the Farmers' and Merchants' pulled into town several lengths ahead. Then the race for lots began. The Farmers' were declared winners as the first bank in Selby."

Products.—The values of products of 1899 are given as follow: Wheat, 35,000,000 bushels, \$18,000,000; corn, 40,000,000 bushels, \$9,000,000; gold and other minerals, \$11,131,436; live stock, \$30,000,000; oats, barley, and rye, \$12,000,000; flax and other grains, \$10,000,000; hay and grass, \$10,000,000; dairy and other products, \$6,000,000; wool, hides, and furs, \$3,500,000; sundry items of agriculture, \$10,000,000; total, \$119,631,436. In 1900 the wheat crop was small in the northern part of the State. The estimate for the entire State was about 23,000,000 bushels. But the corn estimate was from 60,000,000 to 80,000,000 bushels.

The value of the gold produced in 1900 was given by the director of the mint at \$6,617,674, while 280,000 fine ounces of silver were produced.

Political.—State officers were chosen at the November election. Nominations were made by the Republicans, the Prohibitionists, the Mid-Road Populists, and by the other wing of the Populists and the Democrats united on one ticket.

The Republicans met at Sioux Falls, May 23. The resolutions commended the administration and reaffirmed the party principles. The ticket follows: For Governor, Charles N. Herreid; Lieutenant Governor, George W. Snow; Secretary of State, O. C. Berg; Treasurer, John Schamber; Auditor, J. D. Reeves; Superintendent of Schools, E. E. Collins; Land Commissioner, David Eastman; Attorney-General, John L. Pyle; Railroad Commissioner, Frank Lecocq.

A Democratic convention, at Chamberlain, June 6, elected delegates to the national convention, instructing them for Bryan; declared allegiance to the Chicago platform, opposition to imperialism

and to trusts, expressed sympathy for the Boers, and commended Senator Pettigrew. "Admiration for the honorable record of C. A. Towne" was expressed, but delegates were not instructed as to the candidates for the vice-presidency.

A second convention of Democrats was held at Yankton, July 11. The People's party was in convention at the same time and place. Conference committees were appointed, and a fusion ticket was arranged. It was: For Governor, Borre H. Lien; Lieutenant Governor, Abraham L. Van Odel; Secretary of State, Fred B. Smith; Auditor, F. J. Tracy; Treasurer, Charles A. Tedrick; Superintendent of Schools, Miss M. H. Aasved; Commissioner of Lands, Edmund Cook; Attorney-General, A. E. Hitchcock; Railroad Commissioner, W. T. Lafollette. Both platforms denounced the policy of the administration in the Philippines, condemned trusts, commended the administration of Gov. Lee and the course of the Railroad Commission, favored the re-election of Senator Pettigrew, and expressed sympathy for the Boers. The

People's party condemned the policy of the pension commissioner, instructed the electors to vote for Bryan and Towne, and said: "We condemn the outrageous abuse of the military power at Wardner, Idaho, by which civil authority was set aside and peaceable citizens imprisoned for months by armed Federal soldiers without warrant of law, as one of the most dangerous attacks on the liberties of the people in the history of this country. We charge that this attack on the rights of the honest workingmen was made by the War Department, with the full knowledge of, and presumably by the order of the President.

"We condemn the action of the State Board of Equalization for so largely increasing the personal property valuation of the farmers, in some cases more than doubling such valuation, while leaving the valuation of railways and other corporation property, and the credits of banks and other large property holders, without material increase."

The Mid-Road Populists convened at Yankton, Oct. 4, and nominated the following candidates: For Governor, S. E. Stair; Lieutenant Governor, C. J. Maynard; Secretary of State, Fred. Nysturm; Auditor, Frank Stout; Treasurer, Frank W. Bailey; Superintendent of Schools, O. I. Husaboe; Commissioner of Lands, I. I. Stearns; Railroad Commissioner, A. D. Blundin. Mr. Maynard withdrew, and the place of Lieutenant Governor was left vacant. The resolutions approved the Sioux Falls platform and the candidacy of Mr. Bryan, favored the re-election of Senator Pettigrew, and called for a legislative appropriation for the State fair.

The Prohibitionists also named a ticket, as follows: For Governor, F. J. Carlisle; Lieutenant Governor, K. Lewis; Secretary of State, N. J. Davis; Auditor, J. E. Gamble; Treasurer, H. H. Curtis; Superintendent of Instruction, G. H. Grace; Commissioner of Lands, P. S. Rhodes.

CHARLES N. HERREID,
GOVERNOR OF SOUTH DAKOTA.

The returns of the presidential election were: McKinley, 54,530; Bryan, 39,544; Woolley, 1,542; Barker, 339; Debs, 176.

The Republican candidates for State offices and for Congress were elected. The vote for Governor stood: Herreid, 53,803; Lien, 40,091; Carlisle, 1,331; Stair, 316.

Two changes in the Constitution were submitted: One was the repeal of the dispensary amendment, which was adopted in 1898, but had not gone into effect for lack of legislative action to prescribe a method of administering it. The other was to allow the State to loan \$1,000 on a single quarter section of land, the limit having been \$500. For the repeal of the dispensary provision 48,673 votes were cast and 33,072 against. The second amendment was carried by a vote of 49,989 to 5,653.

The Legislature will be constituted as follows: Senate, 39 Republicans, 6 fusionists; house, 78 Republicans, 9 fusionists.

SPAIN, a kingdom in southwestern Europe. The legislative power is vested in the Cortes, consisting of a Senate of 360 members and a Congress of 432 members. Of the Senators half are life and official members and half are elected by the provincial and communal assemblies, the ecclesiastical bodies, universities, and academies, and the most highly assessed taxpayers. Senators in their own right are royal princes, grandees of Spain who have an income of 60,000 pesetas or more, captains general of the army, admirals of the navy, archbishops, and presiding judges of the superior tribunals, numbering altogether 80. The Crown appoints 100 life Senators. The elective Senators sit for ten years, half of them being renewed every five years, but if the Cortes are dissolved all go out. Every Spaniard twenty-five years of age enjoying full civil rights and a citizen of a municipality for two years possesses the right of suffrage. The Congress is composed of 10 Deputies at large receiving over 10,000 votes in several districts, 88 Deputies elected by 26 electoral colleges in which a system of minority representation is carried out, and 334 Deputies elected by districts. The present King of Spain is Alfonso XIII, born May 17, 1886, posthumous son of Alfonso XII and Maria Cristina, an archduchess of Austria, who during her son's minority acts as Queen Regent. The Council of Ministers, constituted on March 4, 1899, was composed in the beginning of 1900 of the following members: President of the Council and Minister of Foreign Affairs, Francisco Silvela; Minister of Justice, Count Torrealaz; Minister of War, Gen. Azcarraga; Minister of Marine, Gomez Imaz; Minister of Finance, Señor Villaverde; Minister of the Interior, Señor Dato; Minister of Public Works, Agriculture, and Commerce, Marquis Pidal.

Area and Population.—The area and population of the 49 provinces at the census of Dec. 31, 1897, is given in the table on this page.

The population consisted of 8,773,730 males and 9,315,770 females. The legal population was 8,884,389 males and 9,341,651 females; total, 18,226,040. The population of Madrid on Dec. 31, 1897, was 512,150; Barcelona, 509,589; Valencia, 204,768; Sevilla, 146,205; Malaga, 125,579; Murcia, 108,408.

Finances.—The revenue for the financial year 1898 was 803,946,904 pesetas, having increased from 754,903,033 pesetas in 1895; the expenditure was 869,402,225 pesetas, having grown from 780,242,373 pesetas. The provisional results for 1899 made the revenue 842,533,002 pesetas and the expenditure 907,189,184 pesetas. Señor Villaverde's budget for 1900 calculated the revenue at

937,930,415 pesetas, of which 391,342,990 pesetas were to come from direct taxes on land, mines, trade, industry, Government salaries, registration, etc., 350,000,000 pesetas from indirect taxes, customs, and excise, 156,150,024 pesetas from the tobacco monopoly, the lottery, the mint, and other sources, 19,578,254 pesetas from profits on Government property, 2,020,000 pesetas from sales of property, 9,755,000 pesetas from the public treasury, and 84,147 pesetas from Fernando Po. The total expenditures were estimated at 937,178,134 pesetas, of which 9,250,000 pesetas were for the civil list, 1,638,085 pesetas for the Cortes, 427,923,882 pesetas for the public debt, 1,638,178 pesetas for the courts of law, 71,075,889 pesetas for pensions, 812,883 pesetas for the Council of Ministers, 4,754,290 pesetas for the Ministry of Foreign Affairs, 54,453,919 pesetas for the Ministry of Justice, 174,329,539 pesetas for the Ministry of War, 28,341,613 pesetas for the Ministry of Marine, 24,518,862 pesetas for the Ministry of the Interior, 88,038,104 pesetas for the Ministry of Public Works, 19,152,019 pesetas for the Ministry of Finance, 29,951,020 pesetas for collection of taxes, and 699,851 pesetas for Fernando Po. The Cortes refused to sanction the scale of taxation proposed by Señor Villaverde, and demanded economies. Some of the new taxes were therefore stricken out and the salaries and superfluous expenses of all the departments were curtailed. The appropriations for the Ministry of Justice were cut down to 53,466,537 pesetas, those for the Ministry of the Interior to 23,441,097 pesetas, of the Ministry of Public Works to 80,736,422 pesetas, and of the

Ministry of Finance to 18,238,083 pesetas, the cost of tax collection to 20,759,904 pesetas, and even the contribution to Fernando Po to 533,051 pesetas. The army budget was reduced to 165,974,331 pesetas, that of the navy to 25,002,973 pesetas. An act was passed taxing the interest on the public debt 20 per cent., which lowered the expense of the debt to 418,557,138 pesetas, the sinking fund being suspended also. The altered scheme of taxation accepted by the Cortes made the revenue from direct contributions 376,020,790 pesetas; from indirect taxes and customs, 325,640,000 pesetas, from stamps and monopolies, 156,650,024 pesetas. The total revenue according to the revised budget was 885,998,215 pesetas, and the total expenditure 905,451,827 pesetas. The people at large were still extremely dissatisfied with the new taxes, although they fell far short of the sacrifices required to meet the additional burden caused by the wars with the colonies and the United States and by the loss of the colonies. In January, 1900, representatives of all the chambers of commerce and of many of the industrial, agricultural, and labor associations met at Valladolid and formed a National Union under the presidency of Señor Paraiso, which, standing outside of the parties, formulated a programme of reforms that would be imposed on the Government, whichever party was in power. The alternative of not carrying out the demands of the reformers to be faced by the Government was a general refusal to pay taxes on the part of the people, all sections of whom were represented in the National Union. The demands were thoroughgoing and comprehensive. The first was a reduction of at least 100,000,000 pesetas in the expenditure contained in the budget. The reformers called for the complete reorganization of all the public services—of justice, by assuring the independence and responsibility of the judges; of public instruction, by making compulsory schools effective; of the army, by reducing the disproportionate number of officers and improving the conditions of the service; of the navy, by limiting expenses to the maintenance of the few useful ships that were left; of the civil service, by reducing by half the number of officials; of the Cortes, by freeing elections from the influence and control of the authorities and making electoral representation a reality. Commerce and agriculture and the development of the natural wealth and capacities of the country should be the special care of the Government, and for this object the reformers demanded a judicious expenditure of large sums of money in subsidies, and on public works.

The financial result of the wars by which Spain lost Cuba, Porto Rico, and the Philippines was the accumulation of a floating debt of 1,445,000,000 pesetas, offset only by 119,000,000 pesetas paid by the United States in accordance with the treaty and 500,000 pesetas paid later for small islands outside of the accepted boundaries of the Philippine archipelago. In addition to this new debt Spain had to assume several redeemable debts formerly paid by the colonies, amounting to 1,469,000,000 pesetas. The budget had for several years past shown an average deficit of 50,000,000 pesetas, and now Spain had to face an additional burden of more than 300,000,000 pesetas a year, which is equivalent to an increase of 37 per cent. over the normal budget, taking this to be 803,000,000 pesetas. The Cortes in consequence were obliged to impose heavy sacrifices on all classes of the population. In the budget for 1900 as finally adopted the redemption of all amortizable debts was suppressed, and taxes were in-

creased or created affecting consumers of coffee, chicory, sugar, and other articles of common use, importation duties were made much higher, the tobacco tax was increased, the stamp duties and royalties were raised, a high income tax was imposed, duties were levied on successions, and the war tax already paid by merchants and manufacturers was made higher, and many other taxes were introduced. The imposition of an income tax of 20 per cent. on the interest of the public debt could not properly be enforced on the foreign holders of the external bonds because the Spanish Government in 1882 had declared the coupons of the stamped bonds to be exempt from taxation. The bulk of this debt was held by French, German, Belgian, and Dutch investors. A considerable amount was owned by Englishmen, too, and when Spanish commissioners in June, 1900, asked the committee that in connection with the council of foreign bondholders looks after the interests of British investors in foreign loans to agree to the reduction they met with a refusal. Subsequently a compromise was effected with the Continental bondholders, which the English were constrained to accept under the threat that otherwise the deduction of one fifth of their interest ordered by the Cortes would be enforced. Under the arrangement finally agreed to, the tax was 12½ per cent., an eighth instead of a fifth, reducing the interest on 4-per-cent. *rentes* to 3½ per cent. instead of 3¼ per cent., and the Spanish Government promised to restore the interest up to the full rate if ever the tax of 20 per cent. on the interest of the internal debt should be suppressed; and if this were diminished to diminish proportionately the tax on the foreign bonds. It was also agreed that the ½ per cent. deducted from the annual interest handed over to the foreign holders of the external 4-per-cent. stamped bonds should not be applied to the expenses of the Government, but should form a sinking fund with compound interest by which the whole debt is to be extinguished in sixty years. Unless holders of three quarters of the bonds signified their acceptance, and unless the Cortes prior to Jan. 1, 1901, ratified the agreement, the convention would be null and void. On Feb. 9 the Chamber agreed to an increase in the *octroi* duties. The Cortes authorized the conversion of the Cuban 6-per-cent. mortgage bonds of 1886, amounting to 565,750,000 pesetas, the Cuban 5-per-cent. bonds of 1890, amounting to 391,558,000 pesetas, the Philippine 6-per-cent. exterior debt, amounting to 197,950,000 pesetas, and the Spanish 4-per-cent. redeemable bonds, amounting to 1,503,635,000 pesetas, into perpetual 4-per-cent. consols. The conversion was effected at the rate of 113 per cent. for the Spanish internal bonds, 120 per cent. for the Cuban bonds of 1886, par for the Cuban issue of 1890, and 127½ per cent. for the Philippine exterior bonds. The Philippine mortgage bonds were converted at the rate of 82½ per cent. The amortization of the redeemable bonds was suspended indefinitely by laws passed in 1897 and 1898 and the law of Aug. 2, 1899, which imposed a tax of 20 per cent. on their coupons and those of the internal and the unstamped external 4-per-cent. bonds. The conversion added over 3,000,000,000 pesetas to the nominal amount of the Spanish internal perpetual debt, which was 2,543,361,578 pesetas. The conversion of the unstamped external bonds into the same stock was authorized previously. A loan issued in the beginning of June was subscribed many times over, so that when popular subscribers had received each one bond the banking houses received less than 4 per cent. of the amount

they applied for. The consolidation of the debts incurred during the colonial war was proposed in the budget for 1901, in which an increase of the spirit tax and a revision of pensions were provided for. The total revenue for 1901 was calculated at 934,428,380 pesetas, and expenditure at 926,498,150 pesetas, leaving a surplus of 7,930,230 pesetas, to be used for the purchase of quick-firing guns. The increase in the yield of direct taxes was estimated at 16,506,940 pesetas, that of indirect taxation at 21,500,000 pesetas, of monopolies at 7,050,000 pesetas, of state dues at 3,126,226 pesetas, and of miscellaneous receipts at 250,000 pesetas, the total increase of revenue over 1900 being calculated at 48,433,166 pesetas, and that of expenditure at 21,046,329 pesetas.

The amount of the state debts of Spain in 1899 was stated to be 5,820,755,098 pesetas, that of the floating debt of the treasury to be 1,957,326,739 pesetas, and that of the colonial debts to be 1,175,258,000 pesetas, making a total debt of 8,953,339,837 pesetas. The interest on the state debt was 270,854,696 pesetas, on the treasury debt 93,020,566 pesetas, and on the colonial debts assumed by Spain 54,681,877 pesetas; total interest charge, 418,557,139 pesetas. The external debt, included in the above, amounted to £136,700,198, consisting of a loan of £144,500 secured on the quick-silver mines, perpetual *rentes* amounting to £76,887,638, and £59,668,060 of redeemable bonds.

The Army.—The decree of July 18, 1899, fixed the strength of the regular army at 45,770 infantry, 12,447 cavalry, 12,834 artillery, 4,115 engineers, 1,460 administrative troops, 881 sanitary troops, 405 men in the Royal Guard, 554 in the military academy, and 1,534 in special services; total, 80,000 men, not including 18,140 in the gendarmery. The war strength is 132,000 infantry, 17,156 cavalry, 12,166 artillery, 11,027 engineers, 11,140 administrative troops, and 483 sanitary troops; total, 183,072 men. In peace there are 14,300 horses and mules and 590 guns. The army is organized in 8 regional corps, 3 containing 1 division, 3 containing 2 divisions, and 1 containing 3 divisions of infantry, with a division of cavalry for 3 of the corps and for 1 a brigade. In the Balearic and Canary Islands and Ceuta 3 infantry divisions are maintained, and in Melilla 1 brigade. Spaniards, when drawn for the army at the age of nineteen, may obtain exemption by paying 1,500 pesetas. There are 13 military colleges, and the youths from aristocratic families have enjoyed by custom the privilege of entering the army without regard to the needs of the service. The consequence is that there are officers of every grade who could not find employment even in war, no fewer than 28,000 altogether.

The Navy.—The Spanish war fleet after the losses in the American war was reduced to 1 second-class turret ship of 9,918 tons, 2 coast guards of the second class, 4 first-class, 2 second-class, and 3 third-class protected cruisers, 1 third-class unarmored cruiser, 5 destroyers, 4 torpedo gunboats, and 4 first-class and 7 second-class torpedo boats, and 7 second-class gunboats and small vessels of special types. There were in 1900 under construction 2 second-class cruisers, 1 third-class cruiser, 1 gunboat, and 4 first-class torpedo boats. The belted cruisers *Cataluña*, *Cardenal Cisneros*, and *Princesa de Asturias*, of 7,000 tons, have 12-inch armor on the hull and 8-inch protection for the guns, and with engines of 13,000 horse power can make 20 knots, as can also the deck-protected cruisers *Alfonso XIII* and *Lepanto*, of 4,800 tons. The *personnel* of the navy is 1,002 officers, 725 artificers, 14,000 seamen, and 9,000 marines.

Commerce and Production.—Spain produces grain, meat, dairy products, and other foods abundant for the needs of the population, and wine, olives, fruits, and fish to export in large quantities. Besides the industries connected with these there are important textile and metallurgical industries and a great variety of minor manufactures. The country is very rich in minerals. Coal is found in Oviedo, Leon, Valencia, and Cordoba, and in 1898 the production was 1,900,000 tons. Iron ores are mined in Vizcaya, Santander, Oviedo, Huelva, and Cordoba, some of them of choice quality, sought by the smelters of other countries; the product in 1898 was 7,125,000 tons, and of pig iron 261,799 tons were produced, and 54,500 tons of Bessemer and 58,105 tons of Siemens steel, and of wrought iron and steel 154,900 tons. In former times Spain was pre-eminent in the manufacture of firearms as well as sword blades, but modern weapons are made by newer processes in other countries. The production of zinc in 1898 was 16,270 tons; of copper ore, 1,388,392 tons; of lead ore, 370,000 tons; of calamine, 27,876 tons; of silver and lead ore, 6,346 tons; of quicksilver, 1,785 tons. Sulphate of soda, sulphur, cobalt, salt, phosphorus, and other minerals are found also, the total number of mines in 1898 being 1,814, employing 79,750 persons. The preparation of sardines gives work to 16,500 people, and the product is worth 15,000,000 pesetas a year, while the fishermen who catch sardines, tunny, cod, and other fish number over 67,000. There are 2,614,000 spindles and 68,300 looms used in the cotton industry of Catalonia, which has now lost its monopoly of the Cuban and Philippine markets. In the woolen mills 662,000 spindles and 8,800 looms are employed. Of raw silk 700,000 kilogrammes were produced in 1898. The production of sugar is about 95,000 tons a year. Of corks 30,000 tons are manufactured. The export of chocolate is considerable. There are numerous paper mills, and of their products cigarette papers and playing cards are of some importance in the export trade. Leather is also exported. Among the smaller industries, some of them ancient and some of considerable artistic development, which in the aggregate amount to much in Spain's foreign trade, are the making of matches, castile soap, licorice, cream of tartar, perfumery, ornamental metal work, silver jewelry, carved woodwork, shoes, and guitar strings. Spain also exports onions, sponges, almonds, raisins, and Malaga grapes. There were 800,000 barrels of grapes exported in 1899, and in 1900 the shipments would have been greater if storms had not reduced the crop. The loss of the colonial markets for cottons and other protected manufactures has been made good by an increase in the trade with South America. The market in the former Spanish colonies for the wines and food products of Spain and for articles characteristic of national taste or habit has not been lost. Spain exports a variety of medical drugs, amounting to 6,000,000 pesetas, entirely supplying the world with some kinds. The trade between Spain and the United States has improved as well as the Spanish trade with other countries. Cotton, wheat, bacon, and sugar are imported from the United States, and tobacco in greater quantities since the imposition of a tariff on Cuban and Manila tobacco. The manufacture and sale of tobacco are a monopoly that was granted to the Bank of Spain in 1887 and extended in 1896 for a period of twenty-five years longer. Although the cultivation of tobacco in Spain is forbidden by law, the managers of the *régie* have begun experiments in different dis-

tricts, expecting to obtain an exemption for the monopoly in the event of their proving successful.

The total value of imports for the fiscal year 1899 was 723,444,369 pesetas, and of exports 918,943,206 pesetas. The imports of cotton were 71,914,000 pesetas in value; of coal, 43,216,000 pesetas; of timber, 30,908,000 pesetas; of chemical products, 25,908,000 pesetas; of machinery, 24,848,000 pesetas; of animals, 23,536,000 pesetas; of tobacco, 23,193,000 pesetas; of codfish, 22,703,000 pesetas; of coffee, 17,292,000 pesetas; of wheat, 14,569,000 pesetas; of hides and skins, 13,112,000 pesetas; of cacao, 10,227,000 pesetas; of wool, 9,977,000 pesetas; of vessels, 9,813,000 pesetas; of silks, 8,769,000 pesetas; of linen yarn, 8,353,000 pesetas; of petroleum, 7,528,000 pesetas; of raw silk, 6,614,000 pesetas. The exports of wine amounted to 139,740,000 pesetas; of iron, 78,198,000 pesetas; of copper, 60,946,000 pesetas; of lead, 57,075,000 pesetas; of olive oil, 46,404,000 pesetas; of cotton cloth, 38,317,000 pesetas; of cork, 31,829,000 pesetas; of oranges, 23,772,000 pesetas; of animals, 22,375,000 pesetas; of hides and skins, 20,087,000 pesetas; of dried raisins, 16,904,000 pesetas; of wool, 16,528,000 pesetas; of almonds, 13,037,000 pesetas; of quicksilver 9,404,000 pesetas; of shoes, 8,967,000 pesetas. The imports of alimentary substances, including wine, were 200,050,015 pesetas in value, and the exports 263,542,087 pesetas; imports of metals and manufactures thereof were 27,824,541 pesetas, and exports 102,028,988 pesetas; imports of minerals, glass, and pottery were 75,833,299 pesetas, and exports 157,793,063 pesetas; imports of drugs and chemicals were 75,093,318 pesetas, and exports 22,754,626 pesetas; imports of cotton and its manufactures were 104,418,813 pesetas, and exports 39,835,541 pesetas; imports of other textile fibers and manufactures were 28,742,277 pesetas, and exports 2,334,944 pesetas; imports of wool and hair and their manufactures were 29,745,828 pesetas, and exports 16,864,550 pesetas; imports of silk and silk manufactures were 27,463,525 pesetas, and exports 3,714,474 pesetas; imports of paper and its manufactures were 9,797,183 pesetas, and exports 8,323,565 pesetas; imports of wood and its manufactures were 53,722,551 pesetas, and exports 38,970,797 pesetas; imports of animals and animal products were 82,130,984 pesetas, and exports 50,623,895 pesetas; imports of machinery, vehicles, and vessels were 101,930,639 pesetas, and exports 731,976 pesetas. The imports of gold and silver in 1899 amounted to 73,556,518 pesetas, and the exports to 14,288,290 pesetas.

The imports from and exports to the principal foreign countries in 1899 were in pesetas as follow:

COUNTRIES.	Imports.	Exports.
France	117,700,000	321,700,000
Great Britain	142,100,000	257,500,000
Cuba and Porto Rico	34,300,000	81,400,000
United States	94,400,000	9,900,000
Portugal	38,700,000	43,700,000
Germany	43,900,000	17,900,000
Belgium	23,000,000	29,700,000
Philippine Islands	16,000,000	27,900,000
Italy	15,900,000	21,000,000
Netherlands	6,400,000	21,800,000
Russia	22,900,000	1,800,000
Norway and Sweden	17,400,000	2,800,000
Argentine Republic	5,900,000	12,700,000
British India	17,300,000
Austria-Hungary	5,100,000	7,300,000
Mexico	1,900,000	10,800,000
Switzerland	7,500,000	3,500,000
Egypt	9,100,000
Uruguay	600,000	5,800,000
Spanish colonies	3,100,000	8,500,000
Other countries	101,500,000	33,900,000
Total	723,400,000	918,900,000

Navigation.—The number of vessels entered at Spanish ports during 1899 was 18,726, of 14,630,115 tons, of which 10,381, of 7,439,819 tons, were with cargoes; the number cleared was 17,418, of 15,265,103 tons, of which 15,504, of 13,989,889 tons, were with cargoes. Of the total number entered 9,096, of 6,203,314 tons, and of those cleared 7,702, of 6,717,698 tons, were Spanish.

The merchant navy in 1899 consisted of 1,052 sailing vessels, of 151,946 tons, and 454 steamers, of 566,392 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in 1899 was 8,120 miles, all belonging to companies, most of which have received subsidies or guarantees of interest from the Government.

The post office in 1898 carried 121,565,000 internal, 19,146,000 international, and 296,000 transit letters, 940,000 internal and 303,000 international postal cards, 96,315,000 internal, 25,417,000 international, and 95,000 transit newspapers and circulars, and 197,000 internal and 59,000 international money letters, containing 253,354,000 and 56,886,000 pesetas respectively. The receipts were 24,817,694 pesetas; expenses, 11,411,988 pesetas.

The length of telegraph lines in 1898 was 19,870 miles, with 45,800 miles of wires. The number of internal messages was 4,213,250; of international messages, 1,061,165; of service dispatches, 177,611; total, 5,452,026. The receipts were 8,074,898 pesetas; expenses, 7,613,158 pesetas. The telephone lines had a length in 1898 of 4,960 miles, with 22,650 miles of wire, besides 1,300 miles of long-distance telephones, with 4,295 miles of wire.

Colonies.—In December, 1898, Spain by the treaty of peace signed in Paris relinquished Cuba and ceded to the United States the island of Porto Rico, the Philippine and Sulu Islands, and Guam, the chief of the Ladrone, or Marianne Islands. In February, 1899, the other Ladrone Islands and the Caroline and Pelew Islands were ceded to Germany. There was a question whether the Sibutu and Cagayan Islands, near the coast of Borneo, were included in the original cession to the United States of the Philippines and the Sulu archipelago. The United States Government therefore offered to purchase the sovereign rights of Spain over these islands for \$100,000, and the proposal was accepted by the Spanish Government in July, 1900. The remaining colonial possessions of Spain are territories in Africa having an aggregate area of about 243,877 square miles and an estimated population of 136,000. The island of Fernando Po, with Annabon, Corisco, Elobey, and San Juan, has an area of 850 square miles and 30,000 inhabitants. Ifni, near Cape Nun, is a Spanish settlement with 6,000 inhabitants, covering 27,000 square miles. The territories of Rio de Oro and Adrar, 243,000 square miles in extent, with an estimated population of 100,000, are administered from the Canary Islands. The territories on the Muni and Campo rivers, having an area of 69,000 square miles and 500,000 inhabitants, are claimed both by Spain and by France.

Political Events.—The Silvela Cabinet underwent many changes on account of the difficulties of the financial situation and the various opinions regarding military matters and political and administrative reforms. The portfolio of Foreign Affairs which Señor Silvela had taken himself he gave to the Marquis Pidal, who was succeeded as Minister of Public Works by Señor Cardenas. Admiral Lazaga became Minister of Marine. On April 18 the Cabinet was reconstructed as follows: President of the Council and Minister of Marine,

Francisco Silvela; Minister of Foreign Affairs, Marquis Aguilar de Campo; Minister of Justice, Marquis del Vado; Minister of Finance, Señor Villaverde; Minister of the Interior, Señor Dato; Minister of War, Gen. Azcarraga; Minister of Public Instruction, Señor García Alix; Minister of Public Works, Señor Gasset. Other modifications occurred in May. On July 6 Señor Villaverde resigned the Ministry of Finance, and was succeeded by Señor Allen de San Lazar, who carried to completion the negotiations with the foreign bondholders regarding a reduction of interest. The temper of the Spanish people was such that had the foreign owners of Spanish *rentes* not consented to a tax on their bonds the Government would have been driven to exact the full tax that Spanish bondholders had to pay, as the Cortes had decreed, although it was a breach of faith to demand any tax from them. On Oct. 16 Gen. Azcarraga resigned his portfolio and Gen. Linares became Minister of War, having first stipulated that he should be allowed to introduce important military reforms and entirely reorganize the army, and that he should have a free hand in dealing with the army and its reform. One of his first acts was to appoint Gen. Weyler as Captain General of Madrid, and to make other important military changes without consulting the Cabinet. The appointment of Gen. Weyler to a post where he was master of the liberties of every citizen of the capital was so unpopular that a dangerous tension in the public mind was created. The ministers were not pledged, although the Premier was, to let Gen. Linares do anything he liked to do with the army. Señor Silvela found himself confronted with so many resignations that he saw no way out of his difficulties except to place the resignation of the whole Cabinet in the hands of the Queen Regent. Gen. Azcarraga was then invited to form a Cabinet, which was constituted on Oct. 23 as follows: President of the Council, Gen. Azcarraga; Minister of Foreign Affairs, Marquis Aguilar de Campo; Minister of Justice, Marquis del Vado; Minister of War, Gen. Linares; Minister of Finance, Allen de San Lazar; Minister of the Interior, Señor Ugarte; Minister of Public Works, Commerce, and Agriculture, Sanchez Toca; Minister of Public Instruction, García Alix; Minister of Marine, Admiral Mozo. When he found that his colleagues would not agree to an increase in naval expenditure Admiral Mozo tendered his resignation, and Marquis Arellano accepted the post, but he resigned directly, and Admiral Ramoz Izquierdo became Minister of Marine. Gen. Linares secured the assent of his colleagues to a series of decrees making radical changes in the army organization and effecting many economies by which money can be obtained for improving the armament and instituting maneuvers and firing practice. The ministers decided, however, that all plans for army reform must be laid before the Cortes.

A new extradition convention was arranged between Spain and the United States, and negotiations were carried on during the year for a general treaty of friendship, commerce, and navigation to replace the old treaty, which lapsed by reason of the war. In November a Spanish-American congress assembled in Madrid. All the Spanish republics of Central and South America were represented, and it was decided to hold similar congresses at intervals of about three years. One of the most important decisions of the congress was to establish a tribunal for the arbitration of any differences that may arise between Spain and any of the republics or between the republics themselves; and to facilitate the working of this tri-

bunal it was resolved to seek to bring about the greatest possible uniformity in the commercial, extradition, maritime, trade-mark, and other laws affecting international intercourse. Emigration from Spain is to be directed hereafter exclusively to Spanish-American countries, which will grant special advantages to Spanish settlers. With the help of academies and societies an active, intellectual intercourse will be kept up, and the science, literature, and art of the Spanish-speaking countries will be made as far as possible the common property of all. Special attention will be given to the preservation of the common language in its purity, and it is hoped that the Americans will recognize the Spanish Academy as the highest authority, and will send over every year some of their best scholars to study Spanish. In order that professional diplomas shall have the same value and recognition in all the countries uniform standards of education in all the schools will be promoted. By preferential tariffs, subsidies to steamship lines, reductions of consular dues, the establishment of bonded warehouses, the laying of a Spanish-American cable, the founding of a great commercial exchange bank with headquarters in Madrid and branches in all the capitals of Spanish America, and other similar means, the commerce between the Spanish countries will be encouraged and advanced. A common standard of value and medium of exchange will be sought. The press of the different countries will be brought into closer relations by reducing postage and telegraph rates.

STEEL CARS. About thirteen years ago began in a small way the manufacture of pressed steel parts to take the place of cast iron in freight-car construction. Pressed steel parts are much lighter and cheaper, and effect a large saving in the weight of a car. After continued use had demonstrated the practical utility of the smaller steel parts, other parts—such as center plates, side bearings, cross-ties, and bolsters—were made. Then came the all-steel truck, which saved from 500 to 700 pounds in the weight of a car. The all-steel underframing soon followed.

Starting with the principle that the ideal object should be to transport the heaviest possible loads with the smallest possible dead weights, Charles T. Schoen invented and designed the all-steel car. These cars were first introduced early in 1896. There are many different designs in steel cars and in the details, most of which are covered by patents. Steel cars are built in the following types: Flat cars, gondolas, coke cars, ordinary coal and ore cars, and also what is known as a self-clearing hopper car, which is perhaps the most important type. A very few steel box cars have been built, but they are still regarded as experimental.

Passenger cars are not made of steel, the only distinct advance toward metallic coach work being seen in the sheathing of a considerable number of passenger-car bodies with copper. The construction of steel cars differs from the construction of wooden cars in that steel requires an entirely different treatment in design. There are several different assemblages of material used in building steel cars: for example, standard rolled shapes, special pressed shapes, and a combination of cast-steel parts, rolled shapes, and pressed shapes. There are also built many cars which in a measure may be classed as steel cars. In this class the underframing is steel, of whatever form desired, and the upper part of the car body is of wood. Steel cars are built with a carrying capacity of 30 to 55 tons, and while many of the smaller old style wooden cars carry as little as 20 tons, the maximum carrying capacity of modern wooden

cars runs as high, in a few instances, as that of the steel car, although the average capacity of wooden cars is less.

The advantages of steel cars over wooden cars are many. They are practically indestructible in case of fire. They are stronger, and therefore can withstand shocks in a collision which ordinarily destroys a wooden car. It is generally acknowledged that thirty years is a very conservative estimate for the life of a steel car, while long ex-

repairs of a steel car. The average annual cost of repairing a wooden car is from \$35 to \$40, while the average cost of repairing a steel car per annum is from \$10 to \$15.

Steel cars for export are generally shipped in sections, and on reaching their destinations are assembled under the supervision of a foreman sent out by the builders. The rapid growth of the steel-car industry can readily be seen by the following figures: In 1900 the total number of all-

A STEEL CAR—SELF-CLEARING HOPPER.

perience has shown that the average life of a wooden car is about fifteen years, at the end of which time the car has practically been rebuilt. The scrap of a retired steel car is always marketable. Wood scrap is valueless except as fuel for boilers. The approximate cost of a wooden car of 80,000 pounds capacity is about \$525, while a steel car of the same carrying capacity would cost about \$810. But the difference in the first cost of a steel car is soon made up by the difference in cost of carrying dead weight and in the saving in repairs.

The difference in weight between a number of 80,000 pounds capacity wooden cars and steel cars, recently figured on, showed the wooden car to weigh 18.2 tons and the steel car 16.1 tons. Putting the cost for hauling per ton-mile at 3 mills, shows a saving per ton-mile of 6.3 mills per car-mile in favor of the steel car. The average freight-car mileage on the Pennsylvania Railroad system last year was 10,000 miles per car. Multiplying this by 6.3 mills, would show an annual saving of \$63 per car in favor of the steel car.

As published in advance sheets of the report of the Interstate Commerce Commission for 1900, the total number of freight cars of all kinds in use in the United States on June 30, 1899, was 1,295,510, not including 46,556 cars which were used in private service of the railroads. If these cars were all steel, the estimated saving on the basis of 80,000 pounds carrying capacity would be a sum far in excess of \$60,000,000, but not all cars are of 80,000 pounds capacity. Another great saving, as previously intimated, is in the cost of

steel cars turned out was 14,464, of these 447 being for export. In 1899 the total number of steel cars turned out was 10,500, while in 1898 but 2,700 were built. In addition to this, 4,140 wooden freight cars for domestic use had steel underframes. The accompanying illustration shows a representative type of steel car now in use.

The largest makers of steel cars are the Pressed Steel Car Company of Pittsburg, Pa., their shops having a capacity of 100 cars a day. The Sterlingworth Railroad Supply Company, of Easton, Pa., makes what is known as the rolled-steel car. In this construction the body of the car is made up of steel channels bound by malleable castings at the corners and riveted at intermediate points throughout their length. Other makers of steel cars are the Cambria Steel Company, Johnstown, Pa.; the American Car and Foundry Company, St. Louis; and the National Rolled Steel Car Company, of Pittsburg, Pa. The Goodwin Car Company, of New York, build steel dump cars. These are used for ballast, ore, etc.

SUNDAY REST, INTERNATIONAL CONGRESS ON. An International Congress on Sunday Rest was held at Paris, France, in connection with the Universal Exposition, Oct. 9 to 12, and was attended by men from different countries representing labor and Sunday rest associations, manufacturing and commercial industries, and other clients. M. N. R. Berrenger, Senator of France, presided. Papers were read on different phases of the Sunday question as related to commerce, railroads, manufacturing, and the state. The experiment of the complete closing of the Magasin du

Louvre on Sunday, where goods have for several years been neither bought nor delivered on that day, was the subject of a special paper, and was represented as having been found satisfactory in its working. Differences of opinion were manifested in the discussion of the question of state legislation to promote Sunday rest and for the protection of men employed in industries, the principal ground of opposition to such action being that it would be in effect an interference with personal liberty; but complete agreement existed as to the duty of the state to give the weekly rest to its own men. A resolution was passed affirming the right of the state to protect its citizens in their privilege of rest, but recognizing the principle that each state should judge as to the expediency and extent of the intervention it might exercise. On the presentation of the report of the Woman's National Sabbath Alliance (United States), the congress advised the formation of similar associations of women in Europe. Other meetings were held in Paris about the same time with this one, but not connected with the exposition, on the religious observance of the Lord's Day, among them the meeting of the International Federation for the Observance of the Sabbath.

SWEDEN AND NORWAY, two kingdoms in northern Europe, united in the person of the sovereign. The throne in both descends to the heirs of the house of Bernadotte. Affairs common to both kingdoms are referred to a mixed Council of State. The reigning King is Oscar II, born Jan. 21, 1829. The heir apparent is Prince Gustavus, Duke of Wermland, born June 16, 1858.

Sweden.—The legislative power is vested in the Riksdag, consisting of the First Chamber, having 150 members, elected for nine years by the provincial and municipal bodies, and the Second Chamber, having 230 members, elected for three years, 80 in the towns by direct suffrage and 150 in the rural districts, a part directly and a part indirectly, by natives of Sweden who own or farm land of a certain value or pay taxes on 800 kronor of income. The Minister of State at the beginning of 1900 was E. G. Boström, the Minister of Foreign Affairs was C. H. T. A. de Lagersheim, and the Councilors of State and chiefs of the various departments were: Justice, Dr. P. S. L. Annerstedt; War, J. I. de Crusebjörn; Marine, Commander G. Dyrsen; Interior, J. E. von Krusenstjerna; Finance, Count H. H. Wachtmeister; Ecclesiastical Affairs, N. L. A. Claeson; other Councilors of State, S. H. Wikblad and D. G. Restadius.

Area and Population.—The area of Sweden is 172,876 square miles. The population was computed on Dec. 31, 1899, to be 5,097,402, consisting of 2,486,447 males and 2,610,955 females. The number of marriages in 1898 was 30,900; of births, 140,217; of deaths, 79,642; excess of births, 60,575. The number of arrivals was 7,974 and of departures 13,663; net emigration, 5,689. The population of Stockholm, the capital, was 302,462; of Göteborg, 126,840.

Finances.—The revenue was estimated in the budget for 1901 at 145,681,000 kronor, of which 960,000 kronor are derived from the land tax, 1,500,000 kronor from tonnage dues, 2,200,000 kronor from farmed domains, 700,000 kronor from the personal tax, 8,000,000 kronor from net profits on railroads, 1,610,000 kronor from telegraphs, 5,800,000 kronor from forests, and 1,131,000 kronor from other resources, all of which are classed as ordinary receipts. The extraordinary receipts are 49,000,000 kronor from domains, 11,590,000 kronor from the post office, 5,000,000

kronor from stamped paper, 18,000,000 kronor from the liquor tax, 9,000,000 kronor from the impost on beet sugar, 3,000,000 kronor from the tax on incomes, and 850,000 kronor from various sources. The surplus carried over from former years was 27,340,000 kronor. The total amount of ordinary receipts is 96,440,000 kronor, and of extraordinary receipts 145,681,000 kronor. The total expenditures were estimated at 132,189,700 kronor, of which 89,564,993 kronor are called ordinary and 42,624,707 kronor extraordinary expenditures. Of the ordinary expenditures 1,320,000 kronor are for the royal household, 3,842,950 kronor for justice, 641,950 kronor for foreign relations, 28,220,084 kronor for the army, 8,652,295 kronor for the navy, 18,019,550 kronor for the Interior Department, including 2,792,963 kronor for administration, 10,750,000 kronor for the post office, 1,610,000 kronor for telegraphs, 1,709,724 kronor for hygiene, and 1,156,863 kronor for other expenses, 7,267,875 kronor for the Finance Department, including 2,982,200 kronor for customs, 450,000 kronor for control of excise duties, and 3,835,475 kronor for other expenses, 13,361,074 kronor for the Department of Worship and Instruction, 4,606,965 kronor for the Agricultural Department, of which 2,279,800 kronor are for forests and 2,327,165 kronor for other expenses, and 3,632,450 kronor for pensions. The extraordinary expenditures are 8,442,316 kronor for the army, 13,224,105 kronor for the navy, 7,849,950 kronor for the interior, 975,625 kronor for the Finance Department, 1,710,026 kronor for worship and instruction, 2,904,335 kronor for agriculture, 1,540,000 kronor for pensions, 5,771,000 kronor for railroads, and 207,350 kronor for other purposes. The expenditures of the public debt office are 11,841,300 kronor for interest and amortization, 1,400,000 kronor for the reserve for insuring workmen against illness, and 250,000 kronor for the insurance fund against accidents to workmen, which items added to the ordinary and extraordinary expenditure of the Government make the total estimated disbursements balance the estimated receipts.

The public debt on Jan. 1, 1900, amounted to 317,489,122 kronor, borrowed almost exclusively for the construction of railroads, including 48,799,500 kronor of internal bonds issued in 1887 and bearing interest at 3½ per cent., 98,663,400 kronor outstanding of the foreign loan of 1880, 58,173,778 kronor of the loan of 1886, 32,741,333 kronor of the loan of 1890, 36,000,000 kronor of the loan of 1899, half the authorized issue, all these bearing 3½ per cent. interest, and 25,111,111 kronor of the international loan of 1888 and 18,000,000 kronor, half the authorized issue, of that of 1894, both of them paying 3 per cent. A new loan of £2,000,000 sterling was arranged in June, 1900.

The Army and Navy.—The Swedish army is not yet organized on the system of universal liability, although this was enacted in 1892. The cantoned troops are maintained by rural proprietors, and the enrolled troops are enlisted for two or three years. The effectives in 1900 were 49 officers and 233 men on the general staff, 1,220 officers and 23,792 men in 56 battalions of infantry, 232 officers and 4,615 men in 50 squadrons of cavalry, 257 officers and 2,766 men in the field artillery, 30 officers and 497 men in the fortress artillery, 16 officers and 135 men in the Gotland artillery force, 77 officers and 821 men in 9 companies of engineers, and 66 officers and 522 men in 8 companies of train; total active army, 1,946 officers, 684 employees, 1,728 noncommissioned officers, 1,655 musicians, and 33,057 men, with 6,891 horses. There were 683 officers in reserve,

and the Landwehr was estimated at 250,000, bringing the fighting strength of the nation up to 290,412 men of all ranks, not counting 8 classes of Landatorm, comprising men between thirty-two and forty years of age.

The navy in 1900 consisted of 7 turret ships, 4 old armored monitors, 9 old armored gunboats, 5 torpedo cruisers built since 1897, 3 antiquated corvettes, 9 nearly obsolete first-class gunboats, 1 second-class gunboat, and 13 first-class and 9 second-class torpedo craft. The principal strength of the navy lies in the armored coast-defense turret ships, of which there will be 10. The Svea, of 3,100 tons, launched in 1886, has 11.8 inches of side armor, and carries 2 10-inch guns, 4 4.7-inch quick-firing guns, and 14 smaller ones. The size, the coal endurance, the gun protection, and the speed have been improved gradually in the later ones, while the weight and thickness of the armor have been lessened without lowering its protective value. The Niord and Thor, launched in 1898, have 3,400 tons displacement, armor 9.5 inches thick, a battery of 6 4.7-inch quick firers, besides the 2 10-inch guns in the turret, and a speed of 16.8 knots. The Dristigheten, not yet completed, has 3,500 tons displacement, and the remaining 3 vessels will displace 3,650 tons, with 9.5 inches of armor, engines of 5,500-horse power, giving a speed of 17 knots, and the armament adopted for the Dristigheten, consisting of quick-firing guns exclusively, 2 of 8-inch bore mounted in the revolving turret, and 6 of 6-inch bore. The armored gunboats are being rearmed with 4.7-inch quick-firing guns. The navy is officered by 3 admirals, 6 commodores, 12 captains, 12 commanders, 62 lieutenant commanders, 54 lieutenants, and 26 sublieutenants on the active list, and 150 other officers in the reserve.

Commerce and Industry.—The cereal crops of Sweden in 1898 were worth 272,000,000 kronor. The yield of rye was 7,565,500 hectolitres; of wheat, 1,600,500 hectolitres; of barley, 5,217,100 hectolitres; of oats, 24,814,400 hectolitres; of mixed grain, 3,721,200 hectolitres; of pulse, 733,800 hectolitres; of potatoes, 13,575,100 hectolitres. The live stock at the beginning of 1898 consisted of 516,809 horses, 2,548,192 cattle, 1,296,851 sheep, and 802,859 hogs. Of 2,086,119 tons of iron ore raised in 1897 there were 1,400,801 tons exported. There were 530,893 tons of pig iron produced, of which 72,469 tons were exported, and of bar iron 160,282 tons were exported from 309,715 tons manufactured. There were 10,068 tons of silver-lead ore, 25,207 tons of copper ore, 56,636 tons of zinc ore, and 2,749 tons of manganese ore raised. The production of copper was 288,595 kilogrammes; of lead, 1,470,509 kilogrammes; of silver, 2,218 kilogrammes; of gold, 113 kilogrammes. The coal output was 224,343 tons. The total value of imports in 1898 was 455,249,000 kronor; of exports, 344,909,000 kronor. The imports of coal were valued at 47,064,000 kronor; of rye and wheat, 30,130,000 kronor; of machinery, 28,810,000 kronor; of coffee, 22,329,000 kronor; of iron manufactures, 17,191,000 kronor; of hides and skins, 16,210,000 kronor; of woollens, 16,114,000 kronor; of woolen yarn, 10,242,000 kronor; of cotton, 10,190,000 kronor; of fish, 9,767,000 kronor; of fertilizers, 9,495,000 kronor; of petroleum, 8,815,000 kronor; of vessels, 7,440,000 kronor; of vegetable oils, 7,268,000 kronor; of cotton goods, 7,220,000 kronor; of wool, 6,323,000 kronor; of tobacco, 5,901,000 kronor; of pork, 5,530,000 kronor; of wood manufactures, 5,526,000 kronor; of silks, 5,111,000 kronor; of bran, 5,096,000 kronor; of cotton varn, 5,077,000 kronor; of iron, 4,914,000 kronor; of paper, 4,369,000 kronor; of

wine, 4,306,000 kronor; of oil cake, 4,052,000 kronor. The exportation of lumber was 146,402,000 kronor; of iron, 45,299,000 kronor; of butter, 39,952,000 kronor; of wood pulp, 15,534,000 kronor; of stone, 8,840,000 kronor; of machinery, 8,643,000 kronor; of paper, 7,836,000 kronor; of joinery, 7,742,000 kronor; of fish, 7,596,000 kronor; of matches, 7,179,000 kronor; of iron manufactures, 5,827,000 kronor; of oats, 4,254,000 kronor; of glass, 4,233,000 kronor.

The value in kronor of imports from and exports to the various foreign countries in 1898 is shown in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain	189,144,000	148,649,000
Germany	158,059,000	49,568,000
Denmark	58,614,000	43,446,000
Russia and Finland	27,068,000	17,113,000
France	8,018,000	28,181,000
Netherlands	10,191,000	25,350,000
Belgium	18,138,000	13,462,000
Norway	21,068,000	5,549,000
United States	10,397,000	91,000
Portugal	1,773,000	1,181,000
Spain	1,498,000	1,430,000
Italy	1,417,000	310,000
Australia	876,000
West Indies	50,000
Other countries	1,633,000	1,126,000
Total	455,249,000	344,909,000

The industrial products of Sweden have increased tenfold in value in thirty years, being estimated at \$275,000,000 in 1897. In wood and iron the country is one of the richest, and water power and electricity make it independent of coal. Local consumption has trebled in thirty years, and in the last few years wages and the cost of living have gone up 30 per cent.

Navigation.—The number of vessels entered at Swedish ports during 1898 was 34,702, of 7,700,000 tons, of which 17,810, of 2,862,000 tons, were Swedish; 2,314, of 841,000 tons, were Norwegian; and 14,578, of 3,997,000 tons, were foreign. The total number cleared was 34,621, of 7,673,000 tons, of which 2,858, of 12,366,000 tons, were Swedish; 838, of 1,558,000 tons, were Norwegian; and 3,977, of 8,201,000 tons, were foreign. Of the total number entered 14,252, of 3,281,000 tons, were with cargoes; of the number cleared 22,125, of 5,383,000 tons, were with cargoes. The number of steamers among the vessels entered was 15,548, of 6,314,000 tons, of which 5,412, of 2,705,000 tons, were with cargoes; the number of steamers cleared was 15,484, of 6,293,000 tons, of which 7,953, of 4,112,000 tons, were with cargoes.

The merchant navy on Jan. 1, 1899, consisted of 2,004 sailing vessels, of 291,392 tons, and 817 steamers, of 265,994 tons.

Railroads, Posts, and Telegraphs.—The railroads on Jan. 1, 1900, had a total length of 6,650 miles, of which 2,290 miles belonged to the Government, and 4,360 miles to companies. The Government lines cost 325,000,000 kronor to construct, the private railroads 312,000,000 kronor. The Government railroads carried 7,728,919 passengers and 4,968,360 tons of freight in 1896, private railroads 12,630,720 passengers and 11,364,837 tons of freight. The total receipts in 1897 were 65,097,537 kronor, and expenses 36,471,958 kronor.

The post office in 1898 carried 64,344,000 internal, 15,871,000 international, and 341,000 transit letters; 7,939,000 internal, 1,376,000 international, and 51,000 transit postal cards; 120,603,000 internal, 7,449,000 international, and 125,000 transit newspapers and circulars, and 3,580,000

internal money letters and postal orders, remitting 816,941,000 francs, and 366,000 international ones, remitting 64,914,000 francs. The receipts were 14,824,085 francs, and expenses 13,345,879 francs.

The telegraph lines belonging to the Government had a length of 5,540 miles in 1898, with 15,980 miles of wire; those belonging to railroad companies had a length of 3,308 miles, with 11,072 miles of wire. The number of paid internal dispatches was 129,681; international, 841,430; in transit, 331,256; service dispatches, 156,899. The receipts were 2,364,326 francs, and expenses 2,010,746 francs.

There were 198 systems of urban telephones in 1898, having 45,540 miles of wire, and the number of conversations was 93,846,774. The long-distance lines had a length of 6,145 miles, with 33,360 miles of wire; number of conversations, 2,785,952.

Legislation.—The improvement of the military power of Sweden on land and sea was the task most urgently impressed upon the Riksdag when it met on Jan. 18, 1900. One of the measures brought forward was for the payment of damages to laborers injured during their work. The Second Chamber declined to sanction the erection of a fortress near Boden at the end of the railroad, but the Government majority in the First Chamber was sufficient to carry the measure on a joint ballot. The Riksdag voted 3,000,000 kronor for small arms and ammunition, and increased the sum allotted to new naval construction to 1,725,000 kronor for 1901. In the beginning of May it was proposed in the First Chamber to impeach the ministers because a Norwegian, M. von Ditten, had been appointed to the chief post in the Ministry of Foreign Affairs, which was in violation of the Constitution. The Premier urged that the constitutional usage would have to be developed in conformity with the act of union, and that the conditions of the union involved the inclusion of a Norwegian in the Ministry of Foreign Affairs. Both Chambers sustained him in his position. On Sept. 12 M. Bos-tröm asked to be relieved of his post for considerations of health, and the King appointed Admiral Fredrik Wilhelm von Otter to the premiership. On Oct. 17 the Council of State decided to intrust the Crown Prince with the Government of the country during the illness of King Oscar, who was unable to attend to public business. In November the Minister of War brought in a bill for the thorough reformation of the military system, the task for which he was appointed to succeed Baron von Rappe in 1899. The reform of 1892 was only a transitional measure, which retained the *indelta*, or cantoned troops, furnished and maintained by landed proprietors in lieu of paying taxes, also the enlisted part of the army, and of the conscripted troops, about 29,000 in each year, it required only ninety days of service. In place of this system universal obligatory military duty will become a reality. All who are liable and fit for service will have to serve three hundred and sixty-five days: in the infantry, two hundred and forty-five days consecutively, and then thirty-five days in each year for three years; in the cavalry, artillery, and a part of the engineers, two hundred and eighty-one days in the beginning, and forty-two days in the second and the fourth year. The army will attain not merely greater unity, but at the same time greater numerical strength. It will consist of 6 similarly composed divisions or corps, and will contain 28 regiments of infantry, with the proper complement of troops of other arms. Both infantry and

cavalry will gain greatly in efficiency, while the fortress artillery will be brought up to such a state that they can perform the duties required in the fortresses even in time of peace. The project includes provisions, moreover, for a considerable reserve. The annual cost is reckoned at 57,000,000 kronor, of which 48,338,000 kronor are for the army alone. The accomplishment of the reform will take twelve years.

Norway.—The legislative power is vested in the Storting, containing 114 members, elected for three years, 38 by the towns and 76 by the rural districts. The Storting elects one fourth of its members to form the Lagthing, which has a veto power over the acts of the Odelsting, composed of the rest of the members. The Minister of State presiding over the Council of State at the beginning of 1900 was J. W. C. Steen, and the Councilors of State in charge of the various departments were: Worship and Public Instruction, V. A. Wexelsen; Justice and Police, E. Löchen; Interior, O. A. Qvam; Public Works, H. H. T. Ny-som; Finance and Customs, E. Sundé; National Defense, Major-Gen. P. T. Holst; Secretary of State, H. Lehman; section of the Council sitting at Stockholm, Minister-of-State O. A. Blehr and Councilors-of-State G. A. Thilesen and J. G. Löv-land; General Secretary, H. Schlytter.

Area and Population.—Norway has an estimated area of 124,525 square miles. The population on Dec. 31, 1897, was estimated at 2,122,400. The population of Christiania in 1900 was computed to be 226,423, having grown from 148,213 in 1891. The number of marriages in 1898 was 15,039; of births, 64,821; of deaths, 32,693; excess of births, 32,128. The number of emigrants in 1898 was 4,859; in 1899 the number was 6,699. The population of Norway has grown at a slower rate than that of any other European country except France. This is due to the large emigration, especially to the United States. To this fact, since a great part of the emigration consists of young men, is due in considerable measure the excess of women over men. Another cause is the constant mortality from drowning among the men, so many of whom are sailors or fishermen. The number of Norwegian settlers in the United States was over 320,000 in 1890, and since then Norwegians have been emigrating at the rate of about 6,000 a year to the United States, and considerable numbers to South Australia, Victoria, and New Zealand, not a few to Hawaii and the Argentine Republic.

Finances.—The revenue for the financial year 1899 amounted to 83,800,000 kronor from ordinary sources, and the extraordinary receipts were 320,000 kronor subscribed locally for railroad construction and 11,564,300 kronor from loans, making the total receipts 95,685,200 kronor. Of the ordinary revenue 5,244,500 kronor came from direct taxes; 37,421,500 kronor from customs; 4,073,900 kronor from the liquor tax; 4,100,800 kronor from the malt tax; 1,562,800 kronor from the tax on playing cards; 1,143,500 kronor from courts of justice; 661,100 kronor from the succession duty; 1,459,400 kronor from state property, 961,500 kronor of it from forests and 497,900 kronor from mines; 2,826,300 kronor from revenue of active capital; 4,620,000 kronor from the post office; 2,066,200 kronor from the telegraphs; 11,981,100 kronor from railroads; 2,225,400 kronor from the university, schools, and worship; 394,800 kronor from prisons; 1,060,400 kronor from hospitals and insane asylums; and 2,957,600 kronor from various other sources. The total expenditure for 1899 was 73,919,400 kronor for ordinary expenses of the Government and 15,004,900

kroner for extraordinary outlay purposes, the latter including 5,158,900 kroner for the construction of railroads, 4,528,600 kroner for the army, 3,248,000 kroner for the navy, and 2,069,400 kroner for other purposes; total disbursements, 88,924,300 kroner. Of the ordinary expenditures 488,400 kroner were for the civil list; 814,900 kroner for the Storting; 1,394,700 kroner for the Council of State and the Ministries; 8,608,800 kroner for worship and public instruction, of which 7,718,600 kroner were expended on the university, schools, and worship, and 890,200 kroner for other purposes; 6,789,400 kroner for justice, police, and sanitary service, of which 913,600 kroner went for the police and prisons, 2,894,200 kroner for the public health, and 2,981,600 kroner for other expenses; 3,498,900 kroner for the Interior Department, including 260,600 kroner for administration, 1,513,000 kroner for agriculture and stock breeding, 310,200 kroner for fisheries, 55,600 kroner for industry and commerce, 432,500 kroner for forests, and 927,000 kroner for other purposes; 23,957,000 kroner for public works, of which 4,361,600 kroner were for the post office, 3,139,900 kroner for telegraphs, 1,163,200 kroner for subscriptions for communications, 11,981,100 kroner for the operation of railroads, 2,515,600 kroner for roads, bridges, and canals, 791,200 kroner for ports, and 4,400 kroner for other purposes; 11,859,300 kroner for finance, including 1,842,000 kroner for customhouses, 606,400 kroner for silver mines, 2,502,100 kroner for amortization, 5,032,400 kroner for interest, 749,900 kroner for pensions, and 1,126,500 kroner for other expenses; 10,335,500 kroner for the army, of which 10,050,700 kroner were for the maintenance of the army and 284,800 kroner for triangulation; 5,357,100 kroner for the marine, of which 4,252,500 kroner went for the navy and 1,104,600 kroner for lighthouses and ports; 665,300 kroner for foreign affairs; and 150,100 kroner for accidental expenses.

The public debt on June 30, 1899, amounted to 198,549,100 kroner, comprising 245,500 kroner of old obligations, 29,941,000 kroner borrowed in 1886 at 3½ per cent., 61,935,100 kroner of the 3-per-cent. loan of 1888, 9,570,700 kroner borrowed at 4 per cent. in 1892, 83,661,000 kroner raised in 1894 at 3½ per cent., 800,000 kroner of 5-per-cent. bonds issued for the construction of a railroad from Drammen to Randsfjord, 11,313,400 kroner of the 3½-per-cent. loan of 1895, 25,242,400 kroner borrowed in 1896 at 3 per cent., and 20,880,000 kroner borrowed in 1898 at 3½ per cent. The Government possesses 46,690,600 kroner of active capital funds, 18,633,900 kroner of cash and arrears to collect, and railroads valued at 111,143,500 kroner; total assets, 166,468,000 kroner.

The Army and Navy.—Military service is obligatory according to the law of June 16, 1885, nominally for six years in the active army, but it is confined to a course of instruction in the first year lasting forty-eight days for infantry, sixty days for engineers, eighty days for field artillery, and ninety days for cavalry, followed by twenty-four days of exercise with the Landwehr, and the same amount of practice annually for two or three years. The strength of the active army is about 900 officers and 30,000 noncommissioned officers and men, and these can be supplemented by 800 or more officers and 50,000 men from the Landwehr and Landsturm.

The fleet in 1900 comprised 4 armor clads built since 1897, 4 old monitors, 3 first-class and 8 second-class gunboats, 1 torpedo dispatch boat, and 8 first-class and 17 second-class torpedo craft. The coast-defense turret ships, all built in England, are powerful for their size. The Harold

Haarfager and Tordenskjold, of 3,500 tons each, have a curved armored deck as well as a 7-inch belt and Harveyized armor on the barbettes, and carry quick-firing guns only, 2 of 8.2-inch bore, 6 of 4.7-inch, 6 3-inch, and 6 smaller ones; their speed is 17.2 knots. The Norge and Eidsvold, displacing 4,000 tons, have their smaller guns in casemates of 6-inch armor. By the law of 1892 all Norwegian sailors are required to go through seventy days of training for the naval service. There are 116 officers in active service, 60 in the reserve, and about 700 petty officers and enlisted seamen.

Navigation.—The number of vessels entered at the ports of Norway during 1899 was 14,456, of 3,140,169 tons, of which 6,573, of 1,961,290 tons, were with cargoes, and 7,883, of 1,178,879 tons, were in ballast; the total number cleared was 14,445, of 3,157,227 tons, of which 13,216, of 2,636,120 tons, were with cargoes, and 1,229, of 521,107 tons, in ballast. Of the total number entered 7,191, of 2,085,730 tons, were Norwegian and 7,265, of 1,054,439 tons, foreign; of the total number cleared 7,235, of 2,111,528 tons, were Norwegian, and 7,210, of 1,045,699 tons, foreign.

The merchant navy on Jan. 1, 1899, comprised 5,981 sailing vessels, of 1,120,808 tons, and 1,068 steamers, of 437,570 tons; on Jan. 1, 1900, 5,698 sailing vessels, of 1,052,687 tons, and 1,128 steamers, of 482,247 tons.

Commerce and Production.—The exports of rough lumber in 1898 were valued at 40,133,300 kroner, and of worked lumber at 18,493,800 kroner. Breadstuffs were imported to the amount of 45,061,000 kroner, butter for 737,400 kroner, and 7,505,500 kroner worth of meat and bacon. The mine products in 1897 were valued at 3,480,000 kroner, and furnace products at 1,432,000 kroner. The catch of cod in 1897 was valued at 12,429,507 kroner; of herring, 7,954,025 kroner; of mackerel, 247,198 kroner; of salmon and sea trout, 1,090,490 kroner; other fish, 3,026,879 kroner; lobsters, 450,744 kroner.

The total value of imports in 1899 was 310,485,000 kroner, and of exports 159,387,000 kroner. Imports of cereals were 51,700,000 kroner, and exports 600,000 kroner; imports of fermented liquors 7,400,000 kroner, and exports 400,000 kroner; imports of colonial produce 21,300,000 kroner, and exports 400,000 kroner; imports of animals and animal food products 16,000,000 kroner, and exports 54,300,000 kroner; imports of coal 24,000,000 kroner, and exports 100,000 kroner; imports of metals 13,800,000 kroner, and exports 2,300,000 kroner; imports of hides and leather 10,100,000 kroner, and exports 6,300,000 kroner; imports of textile materials 6,200,000 kroner and exports 300,000 kroner; imports of timber 6,400,000 kroner, and exports 39,600,000 kroner; imports of minerals 7,200,000 kroner, and exports 4,600,000 kroner; imports of metal manufactures 28,300,000 kroner, and exports 2,100,000 kroner; imports of cloth 36,300,000 kroner, and exports 700,000 kroner; imports of paper and paper manufactures 2,700,000 kroner, and exports 9,100,000 kroner; imports of leather goods 1,700,000 kroner, and exports 200,000 kroner; imports of wood manufactures 3,400,000 kroner, and exports 21,900,000 kroner; imports of drugs and colors 2,100,000 kroner, and exports 200,000 kroner; imports of oils 16,100,000 kroner, and exports 6,200,000 kroner; imports of miscellaneous merchandise 50,200,000 kroner, and exports 16,400,000 kroner. The total imports of alimentary substances were 102,000,000 kroner, and exports 55,800,000 kroner; total imports of raw materials 67,700,000 kroner, and exports 58,200,000 kroner; total imports of

manufactured products 72,400,000 kroner, and exports 34,000,000 kroner; total imports of miscellaneous products 68,400,000 kroner, and exports 16,400,000 kroner.

The values in kroner of the imports from and of the exports to the principal foreign countries in 1899 are given below:

COUNTRIES.	Imports.	Exports.
Great Britain	88,538,000	66,494,000
Germany	88,060,000	22,475,000
Sweden	25,567,000	15,798,000
Russia and Finland.....	25,318,000	5,015,000
Denmark	16,591,000	6,488,000
Netherlands	13,978,000	9,271,000
Belgium	15,786,000	7,183,000
United States.....	19,299,000	907,000
Spain	3,082,000	11,108,000
France	4,218,000	6,882,000
Italy	1,525,000	2,251,800
Portugal.....	1,088,000	543,000
Other countries.....	7,449,000	5,049,000
Total	310,485,000	159,387,000

The majority of the inhabitants of Norway are engaged in agriculture, notwithstanding the fact that the arable soil is found only in isolated narrow valleys. Of the total area of the country 64 per cent. consists of bogs, bare mountains, lakes, and tracts covered with snow and ice. Only 3 per cent. is used as grain fields and meadow land, less than 1 per cent. being devoted to grain crops. Out of 120,000 farmers 109,000 own the land they cultivate. The farms are small and are highly cultivated. Forests cover 21 per cent. of the whole surface of the kingdom. They consist largely of Scotch fir, spruce, and birch. The annual production is about 344,000,000 cubic feet. The restrictions imposed before 1860 were removed in that year because they checked the timber industry. The wholesale cutting down of trees that then followed threatened to denude the country of forests, and in 1893 new laws were passed for their preservation. The state purchased large tracts of forest land, and is making systematic efforts to restore large areas that have been stripped of their timber. While the foreign commerce of Norway has quadrupled in half a century, the mercantile tonnage is nine times as great as in 1850, and in proportion to population surpasses that of every other country, being exceeded only by that of Great Britain, Germany, and the United States. About 20 per cent. of the population are engaged in industrial occupations, and the exportation of manufactures has gone up from 1,500,000 kroner in 1865 to 45,000,000 kroner. Copper, silver, nickel, iron, and zinc are mined, but the ores are not rich, and coal is found only on the island of Andoen. The total mineral output in 1897 was only 3,000,000 kroner.

Railroads, Posts, and Telegraphs.—The Government railroads in operation in 1899 had a total length of 1,230 miles, besides which there were 93 miles of private railroads. The Government railroads in 1898 carried 7,706,516 passengers and 1,679,483 tons of freight; receipts were 10,792,758 kroner, and expenses 7,808,320 kroner.

The postal traffic in 1899 was 36,700,000 internal and 11,776,300 international letters and postal cards; 2,435,600 internal money letters, containing 349,800,000 kroner, and 75,300 foreign ones, containing 23,400,000 kroner; and 54,553,900 internal and 5,369,200 international newspapers and circulars. The receipts were 4,821,662 kroner, and the expenses 4,577,533 kroner.

The state telegraphs in 1899 had a total length of 7,487 miles, with 17,641 miles of wire; other lines a length of 1,178 miles, with 2,098 miles of

wire. The number of internal dispatches was 1,418,167; of international dispatches, 818,062; service dispatches, 25,657; receipts, 2,216,485 kroner; expenses, 2,171,510 kroner.

Storting Elections.—The general election was held early in September. The new Storting was made up of 77 members of the Left and 37 members of the Right and Moderates. In the election of 1897 the Radicals, who had numbered previously 59, and had only a narrow majority in a house of 114 members, won 79 seats, and had therefore a two-thirds majority, which they still retain in the Storting elected in 1900, but only by a single vote. Christiania, which in the former elections the Left won over, the Right regained, the large Socialist vote having reduced the Radical strength. The wave of national feeling that produced the excitement in the last election over the question of the relations with Sweden had somewhat subsided, and the element of the Radical party that was most determined to secure a separate consular representation for Norway and other rights pertaining to an independent nation lost faith in the Radical Premier because he had failed to advance their cause by a single step. The elections were held for the first time under the law of universal suffrage. The Left put forth a programme calculated to attract the new voters, containing among other propositions that were not approved by all adherents of the party a plan for insuring the entire Norwegian people against want in old age. The working people in Christiania nevertheless set up candidates of their own. The Right showed unexpected strength in the rural districts, the Socialist programme of the Left having alienated many of the agricultural voters. The Storting was opened on Oct. 24 by the Crown Prince, who acted as Regent on account of the King's illness. On Nov. 3, Ministers Holst, Nysom, Løchen, and Thilesen having resigned, ex-Minister Konow was appointed Minister of Agriculture; Lieut.-Col. Stang, Minister of National Defense; Capt. Sparre, member of the Delegation of the Council of State sitting at Stockholm; and M. Aarstad, Minister of Finance.

SWITZERLAND, a federal republic in central Europe. The legislative power is vested in the Federal Assembly, made up of the National Council of 147 members, elected by direct universal suffrage for three years, and the States Council of 44 members, representing the cantons, in some of which they are elected by the direct vote of the people, in others by the cantonal legislative bodies. The executive authority is vested in the Federal Council, consisting of 7 members elected for three years by the Federal Assembly, and from among the Federal Council the President of the Confederation and the Vice-President, who by custom is chosen President for the next succeeding term, are elected annually. The Federal Council for the term beginning in 1900 was composed as follows: President of the Confederation and Chief of the Political Department, W. Hauser, of Zurich; Vice-President and Chief of the Department of Justice and Police, Dr. E. Brenner, of Basel; Military Department, E. Müller, of Bern; Department of the Interior, M. E. Ruchet, of Vaud; Department of Commerce, Industry, and Agriculture, Dr. A. Deucher, of Thurgau; Department of Posts and Railroads, Dr. J. Zemp, of Luzern; Department of Finance and Customs, R. Comtesse, of Neuchâtel.

Area and Population.—Switzerland has an area of 15,976 square miles, with a population estimated in the middle of 1898 at 3,119,635. The number of marriages in 1899 was 22,669; of births,

98,113; of deaths, 58,052; excess of births, 40,061. The number of emigrants over sea in 1899 was 2,493, of whom 2,168 emigrated to the United States, 3 to Central America, 266 to South America, 9 to Australia, 10 to Asia, and 37 to Africa. The emigration in 1898 was 2,288; in 1897, 2,508; in 1896, 3,330; in 1895, 4,268; in 1894, 3,849; in 1893, 6,177. The population of Zurich in the middle of 1900 was 165,689; of Basel, 106,433; of Geneva, 92,969.

Finances.—The revenue of the Federal Government in 1899 amounted to 100,476,336 francs, of which 665,048 francs were derived from real property; 2,015,443 francs from invested capital; 66,273 francs from the general administration; 34,383 francs from the Political Department; 522,285 francs from the Department of the Interior, Justice, and Police; 3,164,540 francs from the Military Department; 51,316,600 francs from the Department of Finance and Customs, of which 224,846 francs came from bank notes and 51,091,754 francs from customs; 378,509 francs from the Department of Industry and Agriculture; 42,296,310 francs from the Department of Posts and Railroads, of which 33,977,310 francs came from the post office, 8,072,100 francs from telegraphs and telephones, and 246,900 francs from railroads; and 16,945 francs were accidental receipts. The total expenditures in 1899 amounted to 98,052,644 francs, leaving a surplus of 2,423,692 francs. Of the expenditures, 4,248,118 francs were for interest on the public debt and amortization; 1,108,281 francs for the general administration, of which 217,247 francs were for the National Assembly, 26,666 francs for the States Council, 84,960 francs for the Federal Council, 427,611 francs for the Federal Chancellery, and 351,797 francs for the Federal Tribunal; 644,428 francs for the Political Department; 13,826,944 francs for the Department of the Interior, of which 135,428 francs were for the Statistical Bureau, 105,638 francs for the Health Office, 1,018,389 francs for the polytechnic school, 11,073,003 francs for buildings, and 1,494,486 francs for other expenses; 418,943 francs for Justice and Police; 27,472,117 francs for the Military Department; 4,842,903 francs for the Department of Finance and Customs, of which 347,850 francs were for administration and 4,495,053 francs for collection of customs; 4,622,033 francs for the Department of Industry and Agriculture; 40,848,874 francs for the Department of Posts and Railroads, of which 31,188,874 francs were for the postal service, 9,230,497 francs for telegraphs and telephones, and 429,506 francs for railroads; and 20,003 francs were unforeseen expenditures.

The debt of the federation on Jan. 1, 1900, amounted to 90,039,639 francs, consisting of loans amounting to 69,254,000 francs, 7,556,451 francs for currency reserve, and 13,229,188 francs of other obligations. The assets, including 31,114,001 francs of special funds, amounted to 214,229,175 francs, exceeding the debt by 124,189,536 francs.

The Army.—From the age of twenty to that of thirty-three every Swiss citizen is bound to serve in the Auszug, and from then till he is forty-four years old he belongs to the Landwehr. Service in the Auszug consists in a course of military instruction lasting two or three months, and afterward an annual drill, for the cavalry lasting ten days, and for the other arms three weeks. Those who wish to be exempted must pay 6 francs for a certificate of release and an annual tax varying according to the amount of their fortunes, in the case of some reaching 3,000 francs a year. The strength of the Auszug on Jan. 1, 1900, was 150,876 men; of the Landwehr, 62,789 men in the first and 24,575 in the second division.

Commerce and Production.—There are about 300,000 cultivators in Switzerland who own their land. There were 260,407 quintals of cheese and 203,528 quintals of condensed milk exported in 1898. The wine from 29,984 hectares of vineyards amounted to 854,762 hectolitres, valued at 40,234,267 francs. There were 108,969 horses, 4,851 mules and asses, 1,306,696 cattle, 271,901 sheep, 415,817 goats, and 566,974 pigs in 1896. The forests cover 2,051,670 acres, of which 1,119,270 acres are protected from destruction by the federal authorities. In 1898 there were 8,872,238 trees planted. There are 150 fish hatcheries, which produced 27,636,000 fry in 1898. The production of the salt mines was 432,187 quintals. The quantity of beer made in 267 breweries was 2,118,123 hectolitres. The alcohol *régie* sold 66,945 quintals of spirits for drinking and 45,021 quintals of medicated spirits.

The special imports of merchandise in 1899 were 1,162,595,000 francs in value, and exports 796,014,000 francs; the imports of specie were 124,047,000 francs, and exports 69,653,000 francs, making the total value of imports 1,286,642,000 francs, and of exports 865,667,000 francs. The importation of raw silk was 162,000,000 francs; of cereals, including flour, 117,100,000 francs; of coal, 55,700,000 francs; of woolens, 50,400,000 francs; of iron, 47,500,000 francs; of animals, 47,400,000 francs; of precious metals, 43,100,000 francs; of chemical products, 38,800,000 francs; of wine, 37,000,000 francs; of cotton goods, 35,600,000 francs; of machinery, 34,500,000 francs; of iron manufactures, 30,200,000 francs; of raw cotton, 27,700,000 francs; of sugar, 22,500,000 francs; of timber, 22,300,000 francs; of wool, 18,600,000 francs; of barley, malt, and hops, 16,800,000 francs; of leather, 15,800,000 francs; of building materials, 13,900,000 francs; of coffee, 12,200,000 francs; of petroleum, 11,800,000 francs; of books, 11,500,000 francs; of eggs, 11,200,000 francs; of silk manufactures, 11,000,000 francs; of linens, 10,400,000 francs. The exports of silk manufactures in 1899 were 165,600,000 francs in value; of cotton manufactures, 136,200,000 francs; of watches, 113,500,000 francs; of machinery, 44,800,000 francs; of raw silk, 44,000,000 francs; of cheese, 40,200,000 francs; of silk yarns, 29,800,000 francs; of chemical products, 28,800,000 francs; of milk, 21,300,000 francs; of cotton yarns, 18,700,000 francs; of straw goods, 11,200,000 francs; of hides, 10,600,000 francs; of animals, 10,400,000 francs; of woolen yarns, 9,500,000 francs; of precious metals, 9,000,000 francs; of woolen manufactures, 8,400,000 francs; of jewelry, 7,500,000 francs.

The values in francs of the merchandise imports from and exports to the different foreign countries in 1899 are given in the following table:

COUNTRIES.	Imports.	Exports.
Germany	345,305,000	198,581,000
France	214,267,000	96,288,000
Italy	191,944,000	41,981,000
Great Britain	56,431,000	165,948,000
Austria-Hungary	76,601,000	45,496,000
Russia	57,122,000	31,661,000
Belgium	28,721,000	18,470,000
Spain	15,969,000	15,012,000
Netherlands	8,769,000	5,692,000
Rest of Europe	9,330,000	23,583,000
United States	61,827,000	91,689,000
Rest of America	31,658,000	22,294,000
Asia	42,473,000	30,555,000
Africa	17,736,000	6,386,000
Australasia	10,062,000	3,267,000
Not indicated	4,166,000
Total	1,162,595,000	796,014,000

Railroads, Posts, and Telegraphs.—The railroads in the Swiss republic had a total length on

Jan. 1, 1899, of 2,440 miles. Their cost up to 1898 was 1,210,931,534 francs. Receipts in 1897 were 124,084,175 francs, and expenses 75,263,964 francs. In 1898 the gross earnings from a traffic of 49,543,857 passengers and 13,170,752 tons of freight were 116,980,890 francs. It was decided on Feb. 20, 1898, that the Federal Government shall acquire the railroads and take possession before May, 1903.

The post office in 1899 forwarded 94,791,000 internal and 44,035,000 international letters, 33,717,000 internal and 22,401,000 international postal cards, 37,865,000 internal and 25,003,000 international newspapers and circulars, 5,491,000 internal postal orders for 603,364,000 francs, and 1,173,000 international ones for 53,769,000 francs.

The telegraphs of the Government had a length of 4,380 miles, with 13,375 miles of wire, in 1899, and during that year 1,660,994 internal and 1,698,030 international messages were sent, besides 610,074 in transit and 156,633 service dispatches. There were 288 telephone networks in 1898, with 7,865 miles of line and 38,630 miles of wire, and the number of conversations during the year was 16,335,332. The long-distance telephone wires had a length of 8,035 miles, and the number of conversations between towns was 3,634,244.

Legislation.—The Federal Assembly having passed an act providing for the compulsory insurance, with aid from the federal treasury, of all persons who have no independent means of livelihood against accident and sickness, a demand for a referendum was signed by more than the requisite 30,000 citizens, and the law was referred consequently to the popular vote. This turned out to be opposed to the scheme, less than a third of the total vote being cast in its favor, and of all the cantons only one giving approval. Proposals in the Federal Assembly to curtail the military budget were either rejected or withdrawn. The Chief of the Military Department proposed compulsory naturalization, on pain of having to leave Switzerland, of persons capable of military service who settle in the country without having discharged their military duties in their native land. This was intended to make the Swiss practice uniform with that recently adopted in Germany. Several Swiss citizens of military age residing in Prussia were notified that unless they could prove that they had done military service at home they must apply for naturalization and thereby render themselves liable to the German conscription; otherwise they would be expelled from German territory. The Federal Council raised objections to the proceeding as contrary to treaty. The Prussian Government replied that the article of the treaty permitting the expulsion of persons dangerous to the internal or external security of the state justified the action because young Swiss residents in Prussia who are entirely free from military obligations necessarily have a demoralizing influence on Prussian subjects of the same age who are compelled to serve in the army. The Federal Council protested in vain that dangerous political activity was what the article was intended to guard against. The only concession that the German Government would make was to accept proof from Swiss settlers in Germany that they have paid the tax for exemption as evidence that they have discharged their military duties. In the law framed by M. Müller it was therefore provided that when a legal equivalent has been furnished in lieu of personal military service a foreigner residing in Switzerland will not be disturbed. Two constitutional amendments were submitted to a referendum on Nov. 4. The right of demanding a revision of the federal organic law

was secured to the people by the Constitution of 1848. The federal authorities having decided in 1880 that a demand for the amendment of specific articles or the insertion of new ones was invalid, that only a general revision could be obtained by popular initiative, a new law was framed in 1891 which provided that the repeal or modification of particular articles of the federal Constitution as well as the insertion of new constitutional clauses may be demanded through the medium of popular initiative; that as soon as 50,000 Swiss citizens having the right to vote should present a demand of this kind the question whether such a revision take place should be put to the electors, and the answer would depend upon the majority of the citizens taking part in the vote, and should the answer be in the affirmative the Federal Assembly was to proceed with the revision. The Conservatives, the Socialists, the Democrats, and some of the Radicals objected to this proposal because it left the Chambers free to tamper with the expression of the popular will by drafting a measure calculated to defeat or to give only partial effect to the demand of the people. They proposed to confer on 50,000 electors the right of presenting an amendment or a new clause fully drafted which should be submitted to the people and, if approved, inserted in the Constitution in its original form. Although the Liberals protested against allowing irresponsible persons to formulate bills altering the fundamental laws and by skillful agitation to secure the approval of the people without the careful study and the public discussion which the least important bills of the Federal Assembly must undergo, nevertheless the formulated initiative was approved by the Council of State and the National Council, and on July 5, 1891, the Swiss people, by a vote of 181,882 to 120,372, adopted the law by which a partial revision of the Constitution can be submitted to a referendum in the form of a formulated draft of the proposed amendment or new clause. Only the rural half canton of Basel, the half canton of Appenzel Outer Rhodes, and the cantons of Aargau, Thurgau, and Vaud gave a majority against the law. The Conservative and Socialistic alliance, which with the support of a part of the Radical and Democratic center party carried through the formulated initiative, proposed two further amendments embodying what is called the double initiative, intended to make the legislative and executive authorities of the federation really representative of the nation. The party of the Right and the party of the Extreme Left affirm that the Federal Assembly and the Federal Council are not organs of the national will, composed as they are at present composed. The system of election by majorities, which places the Radical party in control of Parliament and thus enables it to select the members of the Federal Council, did not seem to members of the parties which for years have commanded between them a majority of the voters of the nation and which have been acting in concert to be the right system to secure true popular representation. The Federal Council and its decisions have been subjected to severe criticisms, and its opponents have for a long time asserted that it had lost the confidence of the nation and that there existed against it a deep general dissatisfaction. The double initiative, which would give every interest and every group of political thinkers, even the smallest, its due weight in shaping the legislation of the country and would create a truly democratic national executive, in which only those who are most trusted by the greatest number of citizens can become members of the Federal Government, con-

sists in proportional representation in the National Council and the election of the Federal Council by the direct vote of the people. The proposed amendments to the Constitution by which these changes in the governmental system of the country were to be effected, after a long period of agitation and popular discussion, were submitted to the decision of the people on Nov. 4, 1900. Both proposals were rejected, proportional representation in the National Council by 242,004 popular votes to 163,548 and by 11½ cantonal votes to 10½, the election of the Federal Council by the people by 264,087 popular votes to 134,167 and by 14 against 8 of the cantons. Even cantons that have adopted proportional representation for themselves, such as Solothurn and Neuchâtel, gave a majority against such an innovation in the national representation, and the places where the new democratic theories were cradled, the town of Basel and the town and canton of Bern, rejected their immediate application in the federal government. The popular disaffection toward the statesmen who have managed the public business was not so great but that the people preferred to trust to their practical ability and experience the nationalization of the railroads, the arrangement of new commercial treaties, and other economical questions for the solution of which a tranquil state of the public mind is desirable. The task of improving the military resources of the republic so as to increase its power of resistance to any possible aggression on the part of the powerful states by which the confederation is surrounded engages the study of the authorities with the entire approval of the citizens. The Federal Assembly by the vote of both its branches declined to ratify that part of the resolutions of the Hague Peace Convention which seems to curtail or to fetter the right of a nation to resort to a general levy of its men for the defense of the country. It was decided to retain the system of the *lerée en masse* and to make it as effective as possible by more rigorous provisions. In December the National Council approved an agreement made by the Federal Council and the railroad company for the transfer of the Central Railroad, the first of the five great railroad lines to be taken over. The policy of the nationalization of the railroads on both military and economical grounds has been authorized by the Swiss people in referendum by an overwhelming majority. If the Government and the stockholders are not able to agree upon a price in the case of any of the railroads, the matter will be taken before the Federal Court of Appeal. The Federal Council desired to complete the arrangements for the acquisition before the end of 1901 of all the Swiss railroads with the exception of the St. Gothard line, which can not be acquired before 1909. The struggle of the Boer republics in South Africa attracted much attention in Switzerland, chiefly from the point of view concerning the Swiss national defense. Proposals to intervene diplomatically appealed to some as comparing with the traditional efforts of the Swiss Government to further disinterestedly the peace of nations, but they were rejected by the legislative bodies. In reply to the request for mediation which the Boer republics made to Switzerland as to other powers, the Federal Council declined, in

March, to take any initiative in the matter since the British Government had already refused to conclude peace on the basis of the independence of the republics and had declared to the Cabinet at Washington that it would not accept the intervention of any power.

The Institute of International Law, which held its annual meeting in September at Neuchâtel, discussed the bearings of the Chinese situation in connection with the question as to what are the rights and duties of foreign powers and their subjects, in case of an insurrection, with reference to the established Government which is attacked by the insurgents. Prof. Westlake proposed to insert words that would limit the operation of the principles recommended by the committee to "states that are sharers in European civilization." M. Rolin-Jacquemyns objected to the phrase as possibly excluding Japan and Siam. A similar objection was made to the phrase "Christian civilization." In the *projet de règlement* that was finally adopted no qualifying phrase was used, the principle being accepted that, in the absence of any provision to the contrary, the rules voted by the Institute are applicable only to "normal" states, full members of the family of nations. A distinction between "just" and "unjust" insurrections was also rejected. Nonintervention in insurrections was declared to be an absolute duty. Not even a formal declaration of the intention to intervene can, according to the decision of the Institute, give the sanction of international law to intervention between a state and those subject to its jurisdiction, Prof. Holland's amendment having been voted down. Foreign governments must not furnish rebels with arms or munitions of war, though they are not bound to prevent export by private individuals, nor can a government allow the organization within its territories or waters of an expedition in aid of insurgents; for an export of arms unaccompanied by the men who are to use them, however, a government can not be held liable, Prof. Holland's amendment to that effect being approved. A government may mete out the same punishment to foreigners taking part in an insurrection against its authority as it can to its own subjects, but on the motion of Prof. Catellani this does not apply to cruel or excessive punishments. When a state recognizes its insurgent subjects as belligerents this does not necessitate similar action on the part of other states; but a third state is bound to respect a blockade established by insurgents who have been so recognized, and must allow its vessels to be visited by the war ships of either party. The theory of *renvoi*, the application of foreign rules of law to the decision of legal relations of foreign origin which are not covered by domestic legislation, was condemned. The responsibility of a state for injuries sustained by foreigners through riot or civil war was the subject of much discussion. Occurrences in South America have made the question one of practical interest, and considerable difficulty is presented in the case of a federal government which labors under a constitutional inability to oblige one of its constituent states to give compensation or inflict penalties for what has occurred within the territory and jurisdiction of such state.

T

TENNESSEE, a Southern State, admitted to the Union, June 1, 1796; area, 42,050 square miles. The population, according to each decennial cen-

sus since admission, was 105,602 in 1800; 261,727 in 1810; 422,771 in 1820; 681,904 in 1830; 829,210 in 1840; 1,002,717 in 1850; 1,109,801 in 1860;

1,258,520 in 1870; 1,542,369 in 1880; 1,767,518 in 1890; and 2,020,616 in 1900. Capital, Nashville.

Government.—The following were the State officers in 1900: Governor, Benton McMillin; Secretary of State, William S. Morgan; Treasurer, Edward B. Craig; Comptroller, Theodore F. King; Superintendent of Agriculture, Thomas H. Paine; Superintendent of Instruction, Morgan C. Fitzpatrick; Adjutant General, Horton C. Lamb; Attorney-General, G. W. Pickle; Commissioner of Labor, Robert A. Shiflett; Live Stock Commissioner, W. H. Dunn; Factory Inspector, Martin J. Noonan; Railroad Commissioners, N. W. Baptist, J. N. McKenzie, and Thomas L. Williams; Prison Commissioners, W. M. Nixon, John H. Trice, who resigned and was succeeded in August by W. A. Carter, and A. J. McWhirter; Librarian, Jennie Lauderdale; Chief Justice of the Supreme Court, David L. Snodgrass; Associate Justices, W. C. Caldwell, John S. Wilkes, W. K. McAllister, W. D. Beard; Clerk, A. W. McMillin; Justices of the Court of Chancery Appeals, M. M. Neil, S. F. Wilson, R. M. Barton, Jr.; Clerk, James Turney. All are Democrats.

State elections are held biennially in November of the even-numbered years. The Legislature meets biennially in January of the odd-numbered years.

Population.—The increase in population during the past decade is 14.3 per cent. Of the counties, 8 show a decrease. The population by counties was as follows: Anderson, 17,634; Bedford, 23,845; Benton, 11,888; Bledsoe, 6,626; Blount, 19,206; Bradley, 15,759; Campbell, 17,317; Cannon, 12,121; Carroll, 24,050; Carter, 16,688; Cheatham, 10,112; Cheater, 9,896; Claiborne, 20,696; Clay, 8,421; Cocke, 19,154; Coffee, 15,574; Crockett, 15,867; Cumberland, 8,311; Davidson, 122,815; Decatur, 10,439; DeKalb, 16,460; Dickson, 18,635; Dyer, 23,776; Fayette, 29,701; Fentress, 6,106; Franklin, 20,392; Gibson, 39,408; Giles, 33,035; Granger, 15,512; Greene, 30,596; Grundy, 7,802; Hamblen, 12,728; Hamilton, 61,695; Hancock, 11,147; Hardeman, 22,976; Hardin, 19,246; Hawkins, 24,267; Haywood, 25,189; Henderson, 18,117; Henry, 24,208; Hickman, 16,367; Houston, 6,476; Humphreys, 13,398; Jackson, 15,039; James, 5,407; Jefferson, 18,590; Johnson, 10,589; Knox, 74,304; Lake, 7,368; Lauderdale, 21,971; Lawrence, 15,402; Lewis, 4,455; Lincoln, 26,304; Loudon, 10,838; McMinn, 19,163; McNairy, 17,760; Macon, 12,881; Madison, 36,333; Marion, 17,760; Marshall, 18,763; Maury, 42,705; Meigs, 7,491; Monroe, 18,585; Montgomery, 36,017; Moore, 5,706; Morgan, 9,875; Obion, 28,286; Overton, 13,353; Perry, 8,800; Pickett, 5,366; Polk, 11,351; Putnam, 16,890; Rhea, 14,318; Roane, 22,738; Robertson, 25,029; Rutherford, 33,543; Scott, 11,077; Sequatchie, 3,326; Sevier, 22,021; Shelby, 153,557; Smith, 19,026; Stewart, 15,224; Sullivan, 24,935; Sumner, 26,072; Tipton, 29,273; Trousdale, 6,040; Unicoi, 5,871; Union, 11,894; Van Buren, 3,126; Warren, 16,410; Washington, 22,604; Wayne, 12,936; Weakley, 32,546; White, 14,157; Williamson, 36,429; Wilson, 27,078.

Nashville has a population of 80,865; Chattanooga, 32,490; Memphis, 102,320.

Finances.—The following data are from the Treasurer's and the Comptroller's biennial reports: Balance in the treasury Dec. 19, 1898, \$85,071.41; received from all sources from Dec. 20, 1898, to Dec. 19, 1900, \$6,120,231.44; total, \$6,205,302.85. Paid out on Comptroller's warrants from Dec. 20, 1898, to Dec. 19, 1900, \$6,095,299.87. Balance in the treasury Dec. 19, 1900, \$110,002.98.

Included in the receipts and disbursements shown above are amounts credited and charged to

loan account, receipts from the Penitentiary, and amounts paid out for maintenance of convicts. Omitting these, it is seen that the net receipts in 1899 were \$1,901,976.32; the net disbursements, \$1,788,031.23; the net receipts in 1900, \$2,069,624.98; net disbursements, \$1,801,911.44.

The receipts for the two years exceeded the disbursements \$381,658.63; the Penitentiary receipts over disbursements were \$268,272.94; total, \$649,931.57. Out of this amount were paid Funding Board notes amounting to \$625,000; balance, \$24,931.57.

This balance is represented by an increase of cash on hand Dec. 19, 1900, over Dec. 19, 1898.

The main expenditures for 1900 were: Pensions for disabled soldiers, \$92,742; State Normal College, \$22,856.61; Attorneys-General salaries, \$38,317.61; Tennessee Industrial School, \$60,245.55; maintenance of convicts, \$260,735.42; loan account, \$600,000; State prosecutions, \$145,298.42; interest on State debt, \$547,616; interest on school fund, \$139,350.36; judicial salaries, \$102,743.77; hospitals for the insane—Middle Tennessee \$54,188.77, West Tennessee \$70,793.37, East Tennessee \$52,578.24; School for the Deaf and Dumb, \$42,281.46; School for the Blind, \$32,418.48; Bureau of Agriculture, Statistics, and Mining, \$14,544.75.

The receipts from county trustees, being the property tax for the two years 1899-1900, were \$1,914,700.06, showing an increase over the two previous years, 1897 and 1898, of \$469,190.22. Railroad taxes collected in 1899 amounted to \$198,418.31; for 1900, \$195,402.41.

The total debt of the State is \$17,023,600. Of this, \$13,528,600 is in 3-per-cent. bonds; the remainder of the interest-bearing debt is at higher rates.

The total valuation for assessment in 1900 was \$340,359,148; the State tax, \$1,221,256.

Education.—Among the facts given in the biennial report of the Superintendent of Education are the following: The number of children in the State between the ages of six and twenty-one years is 768,343. Of this number, 573,287 are white, 195,556 colored. The total enrollment is 485,354. The average school term is nearly five months, an increase of one half month during the present administration. The average salary paid teachers per month is more than \$30 (an increase). There are 7,954 schools and 9,195 teachers. The value of school property is, as estimated, \$3,063,568. The schools throughout the State use uniform text-books selected by a State text-book commission.

For a number of years the State has contributed to the support of the Peabody Normal College, in Nashville, conducted as the University of Nashville and Peabody Normal College. The grounds, buildings, etc., with some small sum of money, are given by the University Board: an annual appropriation of \$20,000 is made by the Legislature and expended under the direction of the State board.

The number of students this year was 602.

Among the material improvements during the year at the University of Tennessee are a dairy laboratory and a dormitory for woman students. The attendance in the regular college classes, together with graduates, special students, State students at Knoxville College, and students in the agricultural short course, was 369; in the law department, 56. The total in all departments at Nashville and Knoxville was 750; the number of degrees conferred, 150.

At the State Industrial School there were remaining, Dec. 19, 1899, 760 pupils, of whom 471 are white boys, 224 girls, and 65 colored boys. During the year the income from various sources

was \$90,404.85. This includes the special appropriation of \$10,760.65 made by the General Assembly of 1899, and of which was expended for an addition to the girls' building \$5,000; insurance, \$2,500; steam cooking appliances, electric plant, and enlargement of gas plant, \$3,200.65.

The total attendance at the Deaf and Dumb School was 235; the average, 224.

The fifty-sixth session of the Blind School, ending in June, 1900, was the most prosperous in the history of the school; 205 pupils were enrolled.

Vanderbilt University celebrated its twenty-fifth anniversary, Oct. 22. It received this year a large bequest from Mrs. Mary J. Furman, of Nashville.

At Central Tennessee College, Nashville, 540 were enrolled and 73 were graduated.

Roger Williams University had 268 students, of whom 117 were women.

Lane College, for colored students, in Jackson, has sent out 116 graduates from the normal department since it was organized, in 1878.

The last General Assembly provided in the appropriation bill that each Senator should designate two colored persons, either male or female, to scholarships. The appointment entitles the holder to receive \$50 per annum for two years. The institutions for the colored designated by the State Board of Education under former legislative provisions to receive these scholarship students are Roger Williams University, Fisk University, Central Tennessee College, LeMoyné Institute, Lane College, Morristown Normal College, Freedman's Normal Institute, and Athens Academy. When a person receives a scholarship appointment he can select either of these colleges.

The General Assembly two years ago appropriated \$2,500 annually for teachers' institute work. This appropriation was supplemented each year by a donation of \$1,200 by the Peabody Board of Trust. Six institutes for whites were held, and three for colored teachers.

Charities and Corrections.—The financial report of the Central Hospital for the Insane shows the balance on hand Dec. 19, 1900, to be \$2,448.79. Other statistics were as follow: Total receipts for the two years were \$145,050, divided as follow: Balance Dec. 19, 1898, \$10,606.07; appropriation for 1899, \$51,709.29; for 1900, \$54,332.66; from 16 counties for pay patients, \$6,635.38; private pay patients, \$18,162.80; farm articles sold, \$3,803.80. The disbursements were, from Dec. 19, 1898, to December, 1899, \$69,289.31; from December, 1899, to Dec. 19, 1900, \$73,511.40; total, \$142,801.21.

The statistics of the State Prison, as given by the Prison Commissioners, include the following items: On Dec. 1, 1898, there were on hand 1,525 prisoners. There were received and recaptured during the year 1,596. There were on hand Dec. 1, 1900, 1,744 prisoners, composed of 1,516 State and 228 United States prisoners, being 1,110 in the main prison and 634 at Brushy mountain. State prisoners—white males, 403; colored males, 1,057; colored females, 52; white females, 3. United States prisoners—white males, 138; colored males, 84. Total, 1,744.

Of the 1,551 prisoners received during the two years, there are: College graduates, 22; common-school education, 89; read and write, 178; read, 519; no education, 743.

The main prison is described as a little manufacturing city of 10 industries, consisting of a foundry, harness factory, chair and carriage factory, box factory, shoe factory, hosiery mill, brick manufactory, and the commissioner's manufacturing department. One of the most important features of the work coming under the jurisdiction of the commission is that performed at Brushy

mountain coal mines. There has been produced for the years 1896, 1897, 1898, 1899, and 1900 over 1,116,000 tons of coal, and the entries have been driven nearly 17 miles.

All the prisoners of the penitentiary system are now confined at the main prison and at Brushy mountain.

Militia.—By the annual statement of the Adjutant General's office, it appears that Tennessee has an organized military force of 14,000 men.

Railroads, Telegraphs, and Telephones.—

Full statistics of the roads and lines are given in the biennial report of the Railroad Commission. The total mileage of roads is 3,132, of which 2,947 is main line track. During the past two years fifty-four and a fraction miles have been constructed. The entire assessed valuation of the lines in Tennessee is \$55,295,972.94, of which \$52,943,494.44 is distributable and \$2,352,478.50 localized property. The total amount of tax payable per mile of railroad property is \$250.32, divided as follows: State, \$65.66; county taxes, \$159.91; city taxes, \$24.65. The total State tax collected each year is \$201,410.70; total city or municipal, \$73,452.40; total county, \$474,144.78, making a grand total of \$749,007.90 taxes paid by the Tennessee railroads.

There are but two telegraph companies operating in the State, the Western Union and the Postal. The Postal has 1,900 miles of lines, the assessment footing up \$86,070.60. The Western Union Company has 13,820 miles of line, valued at \$621,930.

The total telephone valuation is \$628,220.20. There are 11 lines, with a mileage of 10,240.

An election was held in Nashville, Dec. 15, on a proposition to subscribe \$1,000,000 to the capital stock of the Nashville, Florence and Northern Railroad. The election resulted in a vote of 5,717 for to 934 against the subscription.

Insurance.—Attention has been called to the fact that there are no life and few fire companies in the State, those which have from time to time been organized having failed or gone out of business. This is said to be due in part to the fact that the companies, besides paying a full property tax, also pay an income tax upon their gross receipts nearly as large as the tax paid by the foreign companies that pay no local or property tax in the State. The 29 life companies doing business in the State in 1899 received in premiums \$2,512,091.90, and paid in losses \$1,161,098.68.

Products.—The coal product in 1900 amounted to 3,500,000 tons. For 1899 the figures of mineral production given by the Commissioner of Labor were: Coal, 3,736,134 tons; coke, 440,157 tons; iron, 667,144 tons; copper, 100,022 tons; zinc, 3,750 tons; barytes, 14,000 tons; phosphate, 462,561 tons. At the time of the report there were in the State 100 coal mines, 15 of which are new ones opened during the year. New discoveries of deposits of lead, zinc, and copper have been reported. The number of phosphate mines has been doubled, the reports showing 15 in 1899 and 30 in 1900. The production shows but little increase, however.

The cotton acreage this year was given as 814,260; the consumption in mills, 37,747 bales. The number of spindles is 172,213.

The report of the Commissioner of Agriculture shows that \$33,403.95 was received from the sale of fertilizer tags.

The Cumberland.—At the Cumberland River Improvement Convention, in November, resolutions were adopted asking for appropriations to furnish slack water from the mouth of the Cumberland to Nashville, 190 miles, and from Nashville to

West Point, in the upper Cumberland, 125 miles. This work can be completed within three years, and at a cost of \$2,750,000.

Lawlessness.—A toll keeper's house was destroyed by a mob near Mount Pleasant, in March. The toll gate had been erected recently, despite a popular protest.

Lynchings of negroes were reported at Ripley in January, at Fayetteville in August, and at Tiptonville in October.

While attempting to capture an illicit still in Polk County, in December, a deputy marshal was attacked by mountaineers. One of his men was killed, and himself and another were seriously wounded.

Tornado.—A disastrous tornado swept over the vicinity of Columbia, in Middle Tennessee, in November. As many as 50 were killed, 100 were injured, and much property was destroyed.

The Anticigarette Law.—The question of the validity of this law came before the Supreme Court of the State, and it was pronounced constitutional. On an appeal to the United States Supreme Court this decision was upheld, though four of the judges dissented.

Political.—A Governor and a Railroad Commissioner were elected in November. There were five candidates for the former office.

The People's party held a convention in April, at Nashville. The important question was, whether delegates should be sent to the national convention at Cincinnati for independent party action or to Sioux Falls for fusion with the Democrats. The Mid-Road wing prevailed, and delegates were chosen for Cincinnati. The choice of a gubernatorial candidate was left to the executive committee, who named H. J. Mullins.

The Republican party was divided into the so-called Brownlow and Evans factions. Contesting delegations were sent to the State convention, April 19, resulting in a bolt of the Evans men, two delegations to the national convention, and two State tickets. The Brownlow candidate for Governor was John E. McCall, and for Railroad Commissioner, W. C. Hornsby. The Evans candidates were W. F. Poston for Governor and W. S. Tipton for Railroad Commissioner.

Both platforms commended the policy of the national administration, called for suppression of trusts, and denounced the Democratic administration of the State. The Brownlow platform condemned especially the election laws, which, it was declared, "differ in no essential particular from the Goebel election law of Kentucky, which has become a stench in the nostrils of American citizens throughout the land." Further, it favored the prohibition of child labor, abolition of the inspection fee required of factory owners, and amendment of the penal code so as to raise the grade of petty larceny to \$50.

The Evans platform commended the service of Mr. Evans in the pension office; condemned the State road law; called attention to the fact that while taxation had increased, "no part of the corpus of the public debt" had been paid; and condemned that part "of the Jarvis law which compels the attendance of witnesses by process of the court, and makes their compensation dependent upon the conviction of criminals."

The national committee heard the contest cases at Philadelphia, and gave Brownlow 16 delegates and Evans 8. The Evans men decided not to carry the contest further. The struggle in the State continued for some time, but at the election Mr. McCall was the only Republican candidate for Governor, with Thomas L. Cate for Commissioner.

The Democratic convention was held at Nashville, May 10, and renominated Gov. McMillin and Commissioner Thomas L. Williams. There was some disagreement over the resolution on expansion; as reported by the committee, it was declared by some of the delegates to be Republican rather than Democratic doctrine, and after discussion 10 names were added to the committee, and the resolution was amended so as to be satisfactory to the convention majority.

The resolutions declared against trusts, in favor of the Nicaragua Canal, prohibition of child labor, abolition of the factory inspection fee, and raising the grade of petty larceny; they declared allegiance to the Chattanooga platform of 1898, approved Gov. McMillin's administration, under which \$1,000,000 of State indebtedness had been paid, and favored the nomination of Mr. Bryan.

The other nominations for the office of Governor were: Prohibitionist, R. S. Cheves; Social-Democratic, C. H. Stockwell.

The vote for presidential electors stood: Bryan, 144,751; McKinley, 121,194; Woolley, 3,900; Barke, 1,368; Debs, 410. For Governor: McMillin, 145,708; McCall, 119,831; Cheves, 3,378; Mullins, 1,269; Stockwell, 257.

There were three candidates for United States Senator, but two of them—Gov. McMillin and Judge Snodgrass—withdrew, leaving only E. W. Carmack as declared candidate.

TEXAS, a Southern State, admitted to the Union Dec. 29, 1845; area, 265,780 square miles. The population, according to each decennial census since admission, was 212,592 in 1850; 604,215 in 1860; 818,759 in 1870; 1,591,749 in 1880; 2,235,523 in 1890; and 3,048,710 in 1900. Capital, Austin.

Government.—The following were the officers of the State for the year: Governor, Joseph D. Sayers; Lieutenant Governor, J. S. Browning; Secretary of State, D. H. Hardy; Treasurer, J. W. Robbins; Comptroller, R. W. Finley; Superintendent of Public Instruction, J. S. Kendall; Commissioner of Agriculture, Jefferson Johnson; Adjutant General, Thomas Scurry; Commissioner of the General Land Office, Charles Rogan; Attorney-General, T. S. Smith; Chief Justice of the Supreme Court, Reuben R. Gaines; Associate Justices, Thomas J. Brown and F. A. Williams; Clerk, Charles S. Morse—all Democrats.

Population.—The increase of more than 36 per cent. for the decade advanced the lead of Texas among the Southern States in population. In the 3,000,000 class her only companion is Missouri. Texas cities of more than 25,000 inhabitants show these comparisons: San Antonio—1890, 37,673; in 1900, 53,321. Dallas—1890, 38,067; in 1900, 42,638. Galveston—1890, 29,084; in 1900, 37,789. Fort Worth—1890, 23,076; in 1900, 26,688. Austin increased from 14,575 in 1890 to 22,258 in 1900.

Finances.—The balance in the treasury to the credit of general revenue at the beginning of the fiscal year, Sept. 1, 1899, was \$1,092,807.94; the receipts during the year ending Aug. 31, 1900, were \$2,859,967.60; making the total receipts, including balance, \$3,952,775.54. There was disbursed during the year \$2,733,781.60; transfers adjusting accounts amounted to \$59,406.40; leaving a balance on hand Aug. 31, 1900, of \$1,159,587.54. To the credit of the available school fund there was a balance Aug. 31, 1899, of \$16,574.76; the receipts during the year were \$3,318,276.23; total receipts, including balance, \$3,334,850.99; disbursed during the year, \$3,081,471.31; leaving a balance on hand Aug. 31, 1900, of \$253,379.68. The cash balance of the permanent school fund Aug. 31, 1899, was \$1,973,341.80; cash received during the year,

\$1,350,507.14; total receipts of cash, including balance, \$3,323,848.94; disbursed during the year, \$2,014,497.34; leaving a cash balance Aug. 31, 1900, of \$1,309,351.60. Bonds on hand to the credit of this fund Aug. 31, 1899, amounted to \$6,447,247.05; bonds purchased during the year, \$1,989,839.05; total, \$8,437,086.10; bonds redeemed during the year, \$643,564.95; leaving a balance of bonds on hand Aug. 31, 1900, of \$7,793,521.15. The amount of occupation taxes collected was \$918,982.48, an increase over the previous year of \$1,984.95. The value of assessed property for 1900 was \$946,320,258, an increase over 1899 of \$23,393,027. There was an increase in value of lands of \$6,106,902; of town and city lots, \$975,042; of horses and mules, \$2,160,587; of cattle, \$5,546,422; of goods and merchandise, \$3,637,388; money in banks, \$1,704,423.

Education.—The biennial report of the State Superintendent of Public Instruction shows the school population in 1900 to have been 706,546. The State apportionment was \$3,002,820.50. The number of teachers employed during the year was estimated at 16,000, a gain of 1,000 over 1899. A statement of the permanent school fund, based on the latest reports of the State Treasurer and the Commissioner of the General Land Office, exhibits these resources: State bonds, \$2,183,100; county bonds, \$3,915,556.60; railroad bonds, \$1,603,317; municipal bonds, \$91,547.55; land notes, \$13,101,330.78; cash on hand, \$1,309,351.60; estimated value of lands leased and unsold, \$20,613,527; total, \$42,817,780.53.

The report says that since 1870 Texas schools have received from the Peabody fund from \$1,000 to more than \$15,000 annually.

The attendance in all departments at the State University for 1899-1900 was 1,041, showing a marked increase, especially in the academic department. Besides localities outside of the State, more than 100 counties of Texas were represented in the enrollment. There are nearly 100 schools in the State in full affiliation with the university, and its continuous and rapid growth seems assured. The medical department in May conferred 41 diplomas, and the graduates in June numbered 116, making 157 in all—the largest number in the history of the university.

The Agricultural and Mechanical College graduated a class of 27. In their biennial report the Board of Directors of the college say that its growth in recent years has exceeded all expectations, and that with adequate appropriations there is practically no limit to its development.

At the Sam Houston Normal Institute the total enrollment for 1899-1900 was 493, representing 130 counties. The graduating class of 1900 numbered 98.

Charities and Corrections.—The number of pupils enrolled at the Deaf and Dumb Asylum Nov. 1, 1900, was 346, against 245 the year previous. In 1900 the various industries were taught to 129 pupils.

The 1900 enrollment at the Institute for Deaf, Dumb, and Blind Colored Youths embraced 20 blind boys, 20 blind girls, 26 deaf boys, and 18 deaf girls, a total of 84.

At the Texas Institution for the Blind, the number enrolled Oct. 31 was 177; number of totally blind, 70. There were 40 boys in the industrial department.

The number of patients in the Southwestern Insane Asylum, Nov. 1, was 704, an increase of 230 during the year. In his report for 1900 the superintendent calls for a change in the lunacy laws so that insane persons can be committed to State institutions without a public trial according

to criminal methods, but upon a certificate of medical men submitted to the county judge.

At the State Lunatic Asylum the number of patients, Oct. 31, was 734, of whom 399 were men and 335 women.

The annual report of the State Orphans' Home shows that there were 12 graduates in 1900, all in honorable employment, for which they were well equipped.

According to the biennial report of the Superintendent of Texas State penitentiaries, the net decrease of prison population from Nov. 1, 1898, to Oct. 31, 1900, was 365; total number of convicts on hand at the latter date, 4,109; percentage of whites, 35.5; negroes, 53; Mexicans, 11.5; pardons for the two years, 350; escapes, 189; recaptures, 78; deaths, 269.

Lawlessness.—At Port Arthur, Feb. 11, a man who had been tried and acquitted of the charge of murder was hanged by a mob, and after an inquest was given a pauper's burial. The grand jury sternly denounced the mob.

The police station at El Paso was attacked, Feb. 17, by an armed mob of negro soldiers from Fort Bliss, in an effort to release two soldiers confined there. One police officer and one of the attacking party were shot and killed.

At Austin, Oct. 15, a large mob of State University students attempted to take possession of the Grand Opera House during a performance. According to the Galveston News, repeated assaults were made by the mob, and several valuable pictures in the lobby of the building were demolished, while for a time the whole police force of the city were unable to quell the rioters.

A fight among several men, one of them a sheriff, occurred at Anderson, Nov. 7, in which two were killed and two wounded, one of the wounded being the sheriff, who was carried into the jail, which was afterward fired on from the courthouse.

Three negroes charged with murder, and said to have confessed, were taken from the jail at Jefferson, Nov. 14, by a mob, who hanged them from a railroad trestle near the town.

Eight men convicted of the Humphries lynching of May, 1899, were taken to the Rusk Penitentiary, Aug. 22, 1900. Three of the lynchings who turned State's evidence were liberated.

A Storm at Galveston.—One of the worst calamities in the history of this country visited Galveston and some parts of the mainland Sept. 8, when a hurricane which swept southern Texas spent its greatest fury upon the "Island City" and adjacent districts. The storm was attended by a huge inundation. At Galveston alone thousands of buildings and millions of dollars' worth of property were destroyed in a few hours. Here, also, the number of lives lost, although never fully ascertained, reached several thousand, to which were added hundreds more in other sections of the storm area. For scenes of horror and deeds of shame—such as pillage and robbery of the dead—nobly offset by acts of heroism and self-sacrifice, the catastrophe will be long remembered. The property loss in Galveston is estimated at more than \$17,000,000, including more than \$3,000,000 lost by the United States Government. More than 4,000 residences were destroyed. The destruction of business buildings and stock, wharfs, shipping, railroad and telegraph property, etc., was proportionately large. More than 30 miles along the shore, above and below Galveston, the country was flooded for several miles inland, and the losses in life and property were relatively as great as those in the city. In October, on incomplete returns, the Department of Agriculture at Washington estimated the agricultural losses, exclusive of

buildings, machinery, etc., at \$5,000,000. Thousands of the coast people were left homeless, but they quickly recovered, with comparatively little assistance, from the first shock of the disaster. In courage and energy the citizens of Galveston also proved themselves equal to their terrible situation, and by the end of the year the restoration of their city was well advanced. At the close of 1900 the relief received by Galveston from all sources amounted to \$1,594,000.

In spite of the great storm and of a short cotton crop in southern Texas, the movement of cotton through the port of Galveston for the calendar year of 1900 was larger than that of 1899, and the city is expected to remain the chief primary cotton port of the world. According to official custom-house figures, the cotton export of 1899 was 1,528,232 bales, valued at \$52,786,731; that of 1900, 1,535,202 bales, valued at \$73,333,364. Of cotton-seed cake and meal and cotton-seed oil, the Galveston exports for 1900 together reached the value of \$6,703,912. At the end of 1900 the storage-elevator capacity of the city was 3,000,000 bushels, and during a season the port can handle 70,000,000 bushels of grain. Diversification of crops has greatly developed Galveston as a general market and shipping point.

Floods.—The Brazos flood of 1899, which caused heavy damage, was followed by great enrichment of the soil along the river bottoms through the deposit of deep sediment with highly fertile qualities, in consequence of which new land was broken and the area of cultivation in many places was largely increased. The spring floods of 1900 on many of the streams caused damage to lands and other property. Those on the Colorado were of extreme violence, and at Austin, April 7, the magnificent dam, which cost \$1,000,000, was swept away with serious loss of life. (For description of this dam, see *Annual Cyclopædia* for 1892, page 252, and for 1893, page 715.) The inundation below Austin was very destructive. There was a sudden flood in the creek at Coleman, July 16, whereby buildings and camps were washed away and lives were lost.

Brazos River Survey.—The end of 1900 brought the completion of the Government survey of Brazos river from Waco to its mouth, 428 miles. The engineers reported that improvement of the river so as to make it navigable at all seasons was only a question of money, the most feasible plan being the construction of locks and dams. Stationary dams were considered unsuitable, on account of the periodical overflows. The fall of the Brazos from Waco to its mouth is about 358 feet.

Independence Monuments.—A monument "to the heroes of the Texas revolution of 1836" was unveiled at Galveston, April 21. It was the gift of the late Henry Rosenberg to the people of Texas, and represents all the prominent features of the revolution. Its full height is 74 feet, and the base is 34 feet square. The bronze statuary, which was cast in Rome, is supported by a structure of the finest Concord granite.

On the same day, to commemorate the same events, a monument erected by the school children of the State was unveiled on the site of old Washington, the town where independence was proclaimed, which was three times the capital of the republic of Texas. The height of this monument is 13 feet and 9 inches, and the material is gray Texas granite.

Legislative Session.—The Legislature held a special session from Jan. 23 to Feb. 21. The Governor's first message dealt solely with the tax bill framed and reported by a commission created at the regular session in 1899. The commission was

directed "to frame and report a bill or bills designed and calculated to secure an exhaustive and equitable assessment of all taxes upon every species of property in this State, real, personal, and mixed, tangible and intangible, and whether belonging to natural or artificial, to residents or nonresidents, to the end that no character of property, assets, holdings, or valuable interests shall escape the due, just, and equal burdens of taxation; and to provide for and enforce the prompt, effective, and complete collection of all taxes imposed."

The Legislature at this session not only failed to reach any final action upon the bill, but was unable even to consider all its provisions. In a final message the Governor gave his reasons for not calling another special session for further consideration of the bill. Among measures of general importance passed at this session was one reducing the rate of taxation so as to save to the people annually about \$300,000 in cost of government; another, settling the differences between the permanent school fund and the State regarding the division of the public domain, whereby all the remaining public domain, amounting to 4,456,000 acres and \$17,000 in cash, were appropriated to the permanent school fund; and a law providing a form of government for the public schools in place of a statute declared unconstitutional by the Supreme Court.

Political.—Two Republican State conventions were held in Waco, March 7, and two sets of delegates to the national convention and two sets of candidates for presidential electors at large were elected. These rival gatherings were the outcome of factional differences.

The first State convention of the People's party was held in Fort Worth, May 4. Resolutions were adopted recognizing the national convention called to meet at Cincinnati, May 9, as the only authorized national convention of the party, and opposing fusion with either of the old parties, but favoring a union of all reformers under the banner of the People's party, with one leader and no surrender of the Omaha platform. All delegates from the State to the Cincinnati convention were instructed to vote for none but a straight Populist as candidate for President or Vice-President. Resolutions were adopted denouncing the British war on the Boers, and expressing sympathy for the South African republics.

The first Democratic State convention met in Austin, June 20. The platform instructed the delegates to the national convention to vote for the nomination of William J. Bryan for President; for the readoption of the Chicago platform, with amendments opposing trusts and combinations in restraint of trade, affirming that all governments derive their just powers from the consent of the governed, opposing all efforts to establish or maintain colonial possessions, renewing allegiance to the Monroe doctrine, demanding speedy fulfillment of our pledge to Cuba, and the same treatment for the people of the Philippines that was promised to the Cubans; for a declaration in favor of a constitutional amendment providing for election of United States Senators by direct vote of the people; for a resolution expressing the cordial sympathy of the United States with the South African republics; and for a declaration in favor of the construction, owning, and operating of the Nicaragua Canal by the United States.

The Social-Democratic State Convention was held in Dallas, July 4, and nominated the following State ticket: For Governor, L. L. Rhoades; Lieutenant Governor, G. H. Shoap; Comptroller, W. A. Mitchell; Treasurer, W. E. Marshall; Com-

missioner of the General Land Office, C. A. Otterbien; Railroad Commissioner, G. B. Harris. The selection of candidates for Attorney-General and Superintendent of Public Instruction was left to the State Executive Committee. A resolution was adopted severing all relations with the national organization because of internal dissensions. The platform approved international socialism and reaffirmed the platform of the Indianapolis convention; indorsed the nomination of Eugene V. Debs and Job Harriman for President and Vice-President; demanded a law prohibiting the employment of children under sixteen years of age in factories, mines, or at any employment that precludes the fullest opportunity for acquiring an education, and which shall provide for assistance, when necessary, from the public funds to furnish food, clothing, books, and supplies without inflicting the stigma of pauperism; a statute prohibiting the employment of women and children in all unhealthful occupations; a statute for rigid inspection of factories, mines, and workshops with reference to the safety and health of the workers; and that a legal workday shall not exceed eight hours. The platform favored the initiative and referendum.

The second State convention of the People's party assembled in Waco, July 24. Presidential electors at large were nominated, and were instructed to vote for Barker and Donnelly. The following State ticket was put in nomination: For Governor, J. C. Kearby; Lieutenant Governor, Clarence Nugent; Attorney-General, J. G. Nix; Commissioner of the General Land Office, S. C. Granbury; Treasurer, P. P. Clark; Comptroller, J. S. League; Superintendent of Public Instruction, Reddin Andrews.

The State Executive Committee was authorized to nominate candidates for judgeships of the higher courts.

The platform demanded the initiative and referendum; abolition of the Railroad Commission; State ownership and operation of transportation so far as necessary to regulate freight rates; construction, ownership, and operation of the Nicaragua Canal by the United States; an efficient system of public schools throughout the State, a change in the scholastic age making it from six to twenty-one years, and free books for the schools, to be furnished by the State; reforms in the judicial system of Texas; legislation to secure equitable taxation and to correct abuses of the fee system. The gubernatorial nomination was declined by J. C. Kearby, and T. J. McMinn was made the party's candidate for Governor.

At the second Democratic State convention, which met at Waco, Aug. 8, these nominations were made for State officers: For Governor, Joseph D. Sayers; Lieutenant Governor, J. S. Browning; Attorney-General, Thomas S. Smith; Comptroller, R. M. Love; Land Commissioner, Charles Rogan; Treasurer, John W. Robbins; Railroad Commissioner, L. J. Storey; Superintendent of Public Instruction, J. S. Kendall; Associate Justice of the Supreme Court, F. A. Williams; Justice of the Court of Criminal Appeals, John N. Henderson.

The platform, in addition to indorsing the State administration and the action of the national convention at Kansas City, including its nominations for President and Vice-President, contained strong declarations in favor of the party policies for the maintenance of good government in Texas. It approved reasonable efforts to equalize taxation and the just taxing of corporations upon their gross receipts; impartial enforcement of the State laws, without discrimination against the weak or in favor of the strong; upholding of the railway commission law, of the railway stock and bond

law, and of the alien land law and the corporation land law; submission by the next Legislature for the action of the people of constitutional amendments to prevent insolvent corporations from doing business in the State, to prevent the use of corporate funds in politics, and to suppress the system of free railroad passes; improvement of the public school system; suppression of mobocracy and whitecapism; and the amendment of the primary election law so that every State primary election shall be held in all the counties on the same day in the case of each party, in order to spare the people the annoyance and expense of perpetual political campaigns.

The Prohibitionists, at their State convention in Dallas, Sept. 14, chose candidates for presidential electors at large, nominated W. K. Homan for Governor and H. G. Damon for Lieutenant Governor, and adopted a platform declaring everlasting enmity to the liquor traffic, demanding prohibition of the manufacture, importation, or sale of alcohol in every form, and inviting all patriotic citizens to join with the Prohibition party at the polls.

The second State conventions of the divided Republican party were both held in San Antonio, Sept. 18 and 19 respectively, and rival State tickets were nominated. The factional troubles were subsequently referred to the Republican National Committee, with the result that the transactions of all the conventions of the two factions were annulled, and new nominations for all offices were made, representing the party in the State at large. Under this adjustment the Republican State ticket was revised and announced as follows: For Governor, R. E. Hannay; Lieutenant Governor, John B. Schmitz; Attorney-General, Lock McDaniel; Treasurer, C. K. McDowell; Comptroller, Joseph Tweedy; Commissioner of the General Land Office, C. G. Brewster; Superintendent of Public Instruction, David J. Abner, Jr.; Railroad Commissioner, Charles B. Peck; Chief Justice of the Supreme Court, J. M. McCormick; Associate Justice of the Supreme Court, F. B. Stanley; Associate Justice of the Court of Criminal Appeals, Charles A. Boynton.

At the election, Nov. 6, the Democrats were successful with their State and electoral tickets. The presidential vote of the State was divided as follows: Bryan, 267,432; McKinley, 130,641; Barker, 20,981; Woolley, 2,644; Debs, 1,846; Malloney, 162.

TRANSVAAL, or South African Republic, a republic in South Africa, founded by Boers who left Cape Colony and established an independent government in Natal in 1836, and migrated into the interior when that country was annexed by Great Britain. The Transvaal Republic was recognized as independent by Great Britain in 1852. In 1877 it was occupied by British troops and annexed to British dominions. In 1880 the Boers expelled the British garrisons, and self-government was restored by the treaty of peace signed on March 21, 1881, the control of foreign relations being reserved to Great Britain as suzerain power. On Feb. 27, 1884, the relations were modified by a new convention, in which Great Britain retained the right to veto within six months of its signature any treaty with a foreign power or a native chief. In October, 1899, war broke out again between the Transvaal and Great Britain; in May, 1900, the capital was occupied by British troops; on Sept. 1, 1900, the Republic was declared to be annexed to British dominions under the name of the Transvaal Colony; and on Oct. 25 the annexation was formally proclaimed at Pretoria. The Boers did not acknowledge the annexation, and were still in military occupation of a good part

of the country. The President of the Republic, S. J. Paulus Kruger, re-elected for the fourth term on May 12, 1898, went to Europe in November, 1900, to seek the intervention of other powers. Gen. Pieter J. Joubert, who died on March 27, 1900, was succeeded as Vice-President by Schalk Burger, and as Commandant General by Louis Botha. The other members of the Executive Council in the beginning of 1900 were F. W. Reitz, State Secretary; Commandant Pieter A. Cronje, Superintendent of Natives; J. H. M. Kock, Keeper of Minutes; and J. M. A. Wolmarans and S. W. Burger. A defensive alliance was concluded with the Orange Free State in 1896, after a raid of Dr. Jameson at the head of Bechuanaland border police in connection with an attempted revolution in Johannesburg, for which Cecil Rhodes, then Prime Minister of Cape Colony, and others interested in gold mines, furnished arms and money with the object of raising the British flag.

Area and Population.—The area of the Transvaal is 119,139 square miles. In an imperfect census taken in 1896 the white population enumerated was 245,397, comprising 137,947 males and 107,450 females. In 1898 it was estimated at 288,750, comprising 166,400 males and 122,350 females. The native population paying taxes was 402,502, and the total native population in 1898 was estimated at 748,759, comprising 148,155 men, 183,280 women, and 417,324 children. The population of Pretoria in 1896 was about 8,000 and in 1898 10,000. Johannesburg, the mining center, had 102,704 inhabitants at the census of July 15, 1896, of whom 51,225 were whites. The state schools, 429 in number, had 11,552 pupils in 1897, besides 555 in the model school, the gymnasium, and the girls' high school in Pretoria. The Government spent £140,286 for education, and many of the English residents in the Witwatersrand gold fields supported their own schools, in which their language was used exclusively, whereas in the Government schools of the district instruction was given in both Dutch and English.

Finances.—The revenue in 1893 was £1,702,684; in 1894, £2,247,728; in 1895, £3,530,955; in 1896, £4,807,513; in 1897, £4,480,218; in 1898, £3,983,560; expenditure in 1893, £1,302,054; in 1894, £1,734,728; in 1895, £2,679,095; in 1896, £4,671,393; in 1897, £4,394,066; in 1898, £3,971,473. Of the revenue in 1898, customs duties yielded £1,066,985; royalties, £125,439; direct taxes, £174,610; mining licenses, £626,025; stamps, £285,383; fines, £90,713; interest, £254,091; posts and telegraphs, £206,332; South African Railroad, £668,951; sale of explosives, £223,342; other sources, £260,779. Of the expenditures in 1898, salaries absorbed £1,080,382; cost of collection, £22,962; justice and police, £141,307; public instruction, £202,831; public health, £88,952; posts and telegraphs, £145,202; War Department, £357,225; public works, £891,332; public debt, £156,657; purchases, £289,271; expenses of Swaziland, £148,961; other expenses, £446,391. The Department of Mining Commissions in Johannesburg collected £849,226, and cost £85,005, making the net receipts £764,221. The debt of the Republic consisted on Dec. 31, 1898, of £136,644 due to the British Government for the occupation in 1877, the 5-per-cent. Rothschild loan of £2,500,000, and a railroad debt of £23,750; total, £2,660,394.

The Army.—Neither the South African Republic nor the Orange Free State has maintained a standing military force except a corps of artillery. The state artillery of the Transvaal in 1899 consisted of 29 officers, 83 noncommissioned officers, and 289 men, and there was a telegraph corps of

1 officer and 15 men. The Orange Free State had 150 artillerymen in active service and a reserve of 550. After the Jameson raid the Transvaal Government gave large orders in Europe for Krupp and Creusot guns, Maxims, Nordenfelts, and Mauser rifles and smokeless powder, to rearm the burghers. A powder factory was established, and European experts were engaged for the manufacture and repairing of arms. The number of large guns belonging to the South African Republic when the war began in October, 1899, was reported by the British Intelligence Department to be 16 Creusot of 15-centimetre caliber, 21 of 37-millimetre and 9 of 75-millimetre caliber, and 15 howitzers. More pompoms and other light guns were brought in before and after war was declared, but additional field guns that were ordered could not be delivered. The Orange Free State had 12 modern 75-millimetre guns and 18 guns of old construction. The capture of 19 British guns in the early battles of the war increased the Boer artillery, so far as it was known, to about 110 guns. The laws of the Transvaal require every male citizen between the ages of sixteen and sixty to join his district commando at the summons of the field cornet and fight for the defense of the Republic until the commando is disbanded. The natives can be commandeered to serve as drivers and runners, and in other noncombatant capacities. The laws of the Orange Free State are substantially the same. The estimate of the fighting strength of the Boer republics made for the British Ministry of War at the outbreak of hostilities was 29,279 burghers in the South African Republic and 22,314 in the Orange Free State; total, 51,593. The Cape Colony and Natal Dutch likely to volunteer in the Boer service were estimated at 4,000, the number of foreigners at the same figure, and the number of police was 1,500, making with the artillery a total of about 62,000.

Commerce and Production.—Sheep, cattle, horses, ostriches, and goats are raised by the Transvaal Boers on enormous farms. Agriculture is so little practiced that wheat and flour are imported. Mealies are grown in the east, chiefly by natives, and are distilled into whisky as well as used for food. The area under regular tillage in the Republic is estimated at 50,000 acres. The mercantile community is composed of English, Germans, and other foreigners. The gold mines, belonging to companies whose stock is held largely in Paris, London, and Berlin, but much of it, too, by the original promoters who have been identified with Johannesburg and the agitation against the Boer Government, produce low-grade ore which can be worked very profitably by modern chemical processes, but only after the outlay of large capital. The miners are natives from all over South Africa engaged on time contracts, the foremen and skilled laborers British and other Europeans and Australians, the technicologists and managers mostly Americans and Englishmen. The trading community and those who live indirectly on the mining industry have come from all quarters of the world. The deep-level mining lands which have not yet been opened belong to the Government, as do also the extensive auriferous lands in the Barberton district. In ten years from the time when the mines of the Witwatersrand became productive the Transvaal rose to be the chief gold-producing country in the world. The value of the output in 1898 was £16,044,135, compared with £11,476,260 in 1897 and £8,603,821 in 1896. In eight months of 1899, at the end of which exports were stopped by war, the product was £12,620,000 in value. The number of whites employed by 73 companies in 1898 was 9,476, and of natives 67,797; another re-

turn gives the total number of persons employed by 86 companies on Dec. 31, 1898, as 88,627. The value of diamonds found in the Transvaal in 1898 was £43,730. The quantity of coal raised was 1,907,808 tons, valued at £668,346.

The total value of imports in 1898 was £10,632,893, having declined from £13,563,827 in 1897 and £14,088,130 in 1896. Of the imports in 1898 the value of £6,332,174 came direct from Europe, £1,203,239 from Natal, £1,158,972 from Cape Colony, £920,289 from the Orange Free State, £536,722 from Lourenço Marques, and £481,497 from other countries. A large proportion of the mining machinery, timber, foodstuffs, hardware, and other articles were the produce or manufacture of the United States. The chief imports were machinery, of the value of £1,462,323; live animals, £1,091,038; textile fabrics and clothing, £926,661; haberdashery, £301,266; woolen goods, £165,876; hardware, £577,949; railroad materials, £206,203; vehicles, £181,238; leather goods, £346,008; flour and grain, £356,507; maize, £200,694; spirits, £202,924; sugar, £198,449; timber, £147,460; furniture, £179,512; Government stores, £129,646.

Railroads and Telegraphs.—There were 774 miles of completed railroads in 1898, connecting Pretoria and Johannesburg with railroads running from Lourenço Marques, Durban, and Cape Town and Port Elizabeth, and having an extension northward from Pretoria as far as Pietersburg and a westward branch to Klerksdorp. There were 270 miles more partly built and 250 miles authorized. The length of telegraph lines within the borders of the Transvaal was 2,200 miles, with 5,650 miles of wire. The number of messages sent in 1898 was 1,674,117.

British Advance on Bloemfontein.—When Field-Marshal Lord Roberts arrived to take command in South Africa on Jan. 10, 1900, the garrisons in Ladysmith, Kimberley, and Mafeking were closely invested by the Boers, who not only held the relieving forces in check, but successfully invaded Cape Colony. Yet 6 divisions had been sent from England. A seventh was on its way, exhausting the reserves, and volunteer forces had been sent from the colonies and raised in South Africa, which were to be supplemented by yeomanry, militia, and volunteers raised in Great Britain. Lord Roberts's plan was to raise the siege of Kimberley by invading the Orange Free State. It not only had that effect, but it raised the siege of Ladysmith also, and compelled the withdrawal of the invading commandos in the northern parts of Cape Colony. When the columns of Lord Roberts struck out into the sandy region of the Orange Free State between Kimberley and Bloemfontein Gen. Piet Cronje was taken by surprise, because the British had not left the railroads before this. He sent a part of his force round by the north, out of the possible reach of the British, and with the rest he endeavored to strike across in front of the British column so as to be able to contest its advance upon Pretoria. Lord Kitchener, who directed the operations, stopped the movement on Kimberley and ordered his whole force to wheel to the right and overtake Cronje. By posting his rear guards well the Boer leader managed to repel the attacks of the mounted infantry, but the cavalry by a forced march from Kimberley succeeded in seizing the Koodoosrand drift on Feb. 17, less than an hour before his arrival, obliging him to go back three miles to Wolveskraal to cross the Modder. There the divisions of Gen. Kelly-Kenny and Gen. Colville, under Lord Kitchener's orders, made a direct attack on the following morning, and sustained a loss of 1,100 men. The tactics employed, which

were much criticised, had the effect of retarding Gen. Cronje's retreat so as to enable Gen. French's half-exhausted cavalry to pass round and inclose him on the east. The position evacuated by Cronje extended from Magersfontein nearly to the Klip drift. That and the position on the Tugela, bestriding another of the railroads by which the British would have to bring their supplies, and that at Stormberg, threatening the railroad that runs from Cape Town to Bloemfontein and Pretoria, were the strongest positions that the Boers could have chosen to defend their country against invasion. All three had to be given up when Lord Roberts decided to invade the Orange Free State independently of the railroads, moving up forces from Cape Colony to co-operate in establishing railroad communication afterward.

The invasion of the Orange Free State by 23,000 infantry and 11,000 mounted men, with 98 guns and a transport of 700 wagons drawn by 9,000 mules and oxen, began on Feb. 12, 1900. At Paardeberg Cronje made a heroic stand when headed off by the British cavalry, and on Feb. 27 surrendered with 4,080 men. A large part of his force during the siege of ten days had escaped by evading the investing line, taking some of the guns and a good part of the stores. The invasion of the Orange Free State by the British produced an immediate and complete change in the military situation.

The Boers after Paardeberg abandoned the offensive and retreated from their positions at Stormberg and Colesberg in Cape Colony, and brought away their guns from their line investing Ladysmith and the works on the Tugela, against which Gen. Buller had repeatedly hurled his army with disaster. The Free Staters could not be kept in Natal and Cape Colony when their homesteads were at the mercy of the invader. When Lord Roberts set out from Jacobsdal, Gen. Buller moved simultaneously round the Boers' left flank, captured Monte Cristo hill on Feb. 18, on the following day occupied Hlangwane, brought his troops across the Tugela, advanced on Grobler's Kloof, made an unsuccessful attack on Railway hill on Feb. 23, and had to retreat over the Tugela, but made a fresh passage on Feb. 26, took Pieter's hill on Feb. 27, the day of Cronje's surrender, and on the day following relieved Ladysmith. The Boer forces, which were commanded by Gen. Louis Botha, while they gave the British some of the severest fighting they had yet gone through, were all the time melting away, and they made their last gallant stand only for the purpose of covering the removal to the railroad of their guns and ammunition and the accumulated stores of all kinds. Their evacuation of Hlangwane was without orders, and was due to the feverish anxiety of the Free State Boers to return to their homes. When Gen. Buller had driven a wedge into their position and the departure of Free State troops had left their long line on the Tugela very thinly manned, retreat became inevitable. With 20,000 men they had held 10,000 British troops in Ladysmith, and at the same time resisted the advance of 30,000 men from the south.

Two of the Boer commandos in Cape Colony hastened first to the relief of Gen. Cronje when he was encircled by the British at Paardeberg, leaving the western district that they held to be reoccupied by the British. Gen. Brabant with his colonial troopers entered Dordrecht on Feb. 18, and on Feb. 25 occupied Jamestown. The Boers in front of Arundel made an attack on Feb. 20, but it was only preparatory to withdrawal. On Feb. 25 Col. Clements chased them back to Kuifontein, on Feb. 27 he reoccupied Rensberg, from which he

had been driven a fortnight before, and on Feb. 28 he entered Colesberg. On March 4 Brabant captured the Boer position on Labuschagne Nek. At Stormberg the Boers held their position strongly yet on Feb. 24, when they repelled a British attack, but they retired after the surrender of Cronje, and on March 5 Gen. Gatacre occupied the natural fortress which had stopped his first attempted advance into the Free State. The retirement of the Boers from Cape Colony was accomplished in perfect order with a stubborn rear-guard defense.

Lord Roberts in his march to Bloemfontein was threatened on the left flank by the Boer forces escaped from Cronje's army and summoned from Cape Colony and Natal, which were rallied by the presidents of both republics. The British had captured a large train of provisions belonging to the Boers when pursuing Cronje, and now were crippled by the loss of a large part of their own convoy, which the Boers captured on the Riet river at Waterval. While the British rested at Osfontein the Boers entrenched themselves on both sides of the Modder river at Poplar Grove, Gen. Christian de Wet in command. This position, 15 miles long, the British succeeded in turning on March 10, and after a fight with the British cavalry and horse artillery, whose jaded horses were almost used up in the long circuitous march, the Boers retreated in good order, having inflicted a loss of 50 on the attacking force, which made three assaults on an elevated position from which Gen. Delarey defended the Boer left flank. At Driefontein the central column of the three into which Lord Roberts divided his army found the Boers holding a double line of kopjes crossing the road. The third column, advancing along the Modder, turned its course southward to co-operate in the capture of the Boer position, which was vigorously defended till dark by the men who had come from Colesberg, joined by others from Ladysmith, Gen. Delarey commanding. On March 12 Gen. French with the British vanguard occupied hills commanding Bloemfontein. The Boers made no further attempt to defend the Free State capital. They were concentrating on a strategic line north of it, and the delay that Gen. de Wet and Gen. Delarey had caused gave time for the forces to assemble and reorganize. For the British their resistance had serious consequences. Fatiguing marches to carry out rapid flanking operations exhausted and disabled horses, so that the British were practically without cavalry mounts or transport. On March 13 Lord Roberts took possession of Bloemfontein. The evening before President Steyn and the other officers of the Free State Government, without replying to Lord Roberts's demand for surrender within twenty-four hours, departed with the archives, except two pro-British officials, who remained to hand over to Lord Roberts the keys of the public buildings.

Annexation of the Orange Free State.—After the occupation of Bloemfontein Lord Roberts endeavored to clear the country in the south and restore railroad communications with Cape Colony. The cavalry of Gen. French and Gen. Pole-Carew, co-operating with Gen. Brabant, endeavored to cover the line extending from Bloemfontein and Ladybrand, on the Basutoland border. Gen. Louis Botha, in command of the Boer forces in the southeast of the Free State, skillfully evaded the strong mounted force sent eastward to intercept him, passing up the Leeuw river valley the day before Gen. French completed the cordon that was intended to hem in the Boer column, which was hampered on its long march by an enormous train. The British were not strong enough to occupy the part of the Free State south of Bloem-

fontein. Lord Roberts issued a proclamation requiring the burghers to deliver up their arms under penalty of being punished and having their property confiscated. Mobile detachments passed through the districts from which the Boer forces had been withdrawn, and many of the Free State burghers gave up arms. Even those apparently loyal to British rule could not be trusted. A long pause at Bloemfontein was necessary to accumulate supplies for the advance upon the new positions of the Boers between Bloemfontein and the Vaal river. Horses had to be got for the cavalry and artillery and transport animals. The cold season had begun, yet the soldiers had no warm clothing. Before the army reached Bloemfontein it was reduced to quarter rations. Supplies were found there, but before long the question of food became serious in the absence of safe railroad communications.

The Boers, taking advantage of the crippled condition of the British army, established their outposts within 20 miles of Bloemfontein, and made excursions into the southern country to keep in touch with the burghers who still had arms and ammunition. The eighth division of troops sent from England debarked at Cape Town, making the total British force in South Africa more than 200,000 men, and it was followed by a ninth division.

Commandant Olivier, who retreated from Stormberg with 15 guns and a great convoy, left Rouxville just before Gen. Brabant arrived there to intercept him. While he moved northward along the Basutoland border, a cavalry brigade marched from Bloemfontein to Thaba Nchu to cut him off, and a detachment entered Ladybrand, but was driven out by the Boers. The 6,000 men of Commandant Olivier, having gained the Platberg, commanded Ladybrand and could defy the British, having a safe line of retreat to the north. On March 25 Gen. French attempted to dislodge the Boers who were entrenched, 2,000 strong, near Karee Siding, and lost 180 men in an infantry attack, but by stretching out his line he compelled them to abandon their position for fear of being surrounded. This was the first move in the northward advance. Before the British could make a new advance much remained to be done to clear their rear and render secure the position they then held. The Boers had become very active again, and threatened to retake Bloemfontein. On March 30 a mounted force commanded by Col. Broadwood, which held Thaba Nchu, finding itself threatened by the Boers on the north and east, retired in the night toward Bloemfontein, pursued by the Boers, who opened fire from three sides in the morning. The baggage and two horse artillery batteries, which were sent on while the mounted troops remained to act as a rear guard, marched into an ambush prepared for them at Koornspruit, where 150 men were killed and 200 taken prisoners, and 7 guns and all the baggage fell into the hands of the Boers. One of the batteries entered a drift, and the Boers quietly secured the surrender of the officers and men as they came along without a shot being fired and without those in the rear being aware that the guns and baggage train ahead had been given up to the enemy. The men of the other battery fought bravely under a cross fire and brought away some of the guns. An infantry division and two cavalry brigades were sent out from Bloemfontein, but Gen. Colvile, who commanded the re-enforcements, returned after an arduous and futile march, leaving the enemy in possession of the waterworks. The Boers moved round to the south of Bloemfontein after the withdrawal of the British, and on April

4 they captured at Reddersburg an entire detachment, consisting of 167 mounted men and 424 infantry, of whom 10 were killed and 36 wounded. These successes led hundreds who had surrendered to the British and returned to their farms to rejoin the active Boer forces. Gen. de Wet joined hands with Olivier's commando from Ladybrand at Wepener, and closely besieged the British force that was posted on the Basutoland frontier to keep the Kaffirs loyal. Here, as at Mafeking, the British had natives fighting with them. When relief from Bloemfontein approached the Boers withdrew. A large part of the British army was needed to garrison Bloemfontein on account of the known hostility of the Dutch citizens, who kept the Boer generals informed of all movements of the British and who had many weapons concealed. Lord Roberts deported the citizens whom he suspected. The blunders at Koornspruit and Reddersburg were humiliating to the British. The primary blunder of leaving detachments at Thaba Nehu and Wepener unconnected with the base raised a question as to the competency of the British commanders, and the retirement of two divisions under Gen. Colville's command, the infantry division, and Gen. French's cavalry, leaving the whole southern country open to the commandos of De Wet and Olivier, seemed to have turned the tide of war once more in favor of the Boers. The inability of British generals to cope with the Boer militia attracted the attention of the military men of all countries, and the publication of some dispatches in which the English commanders commented sarcastically on the careless manner in which their subordinates led their men into Boer traps brought on a discussion as to the advisability of reforming the whole military system of Great Britain, even to the extent of introducing compulsory service. The Boer military system was a national one in which every burgher was versed, in which the tactics were familiar to all, and the plan of every action was communicated to all the soldiers who took part. Every Boer was not only a fair marksman, but possessed a good eye for country and cover, and was able to judge whether a hill or a fold in the ground was defensible and offered facilities for attack or retreat. The art of digging trenches and erecting *schanzes*, or breastworks of stone, and of putting them in the position where they were effectually concealed from any advancing force, was a natural faculty of the burghers developed in their incessant warfare with the natives and their previous conflicts with the British. The mobility of their army, in which every man was mounted, not only enabled them to strike hard blows where they were not expected, but was of greater use in defense, permitting them to mass their whole strength at the points attacked, denuding every other point of their line, which they did with seeming recklessness. They could thus hold a line of fortifications with a tenth of the force that a European general would consider necessary, and impressed the English with the belief that they were ten times as strong as they actually were. The individual initiative allowed to every burgher and the knowledge that every burgher possessed of what was going on contrasted with the British method of concealing all intended movements not only from the men, but from the officers except the few who had to do with directing operations. As far as possible, the plan of an intended battle was communicated to the whole Boer army beforehand; and, knowing the general plan, every man had a clear idea of the right thing to do in the emergencies that arise in the separate parts of a battlefield. The Boers had no admiration for courageous

daring unless strategic necessity called for a sacrifice of life. Piet Cronje's wonderful rear-guard fight and the tenacity with which his men held out in their holes in the river bank to enable the main force to escape won the highest praises, but whenever an exposed position was incautiously occupied, no matter how valiantly it was defended, as Elandslaagte was by the Johannesburg commando, the Boer generals had no praise for the bravery of their men, only blame for their rashness. In holding on to a position as long as possible, and then retiring to one in the rear and defending that to the last, no troops ever displayed greater courage. They had not the courage, however, to take risks in following up an advantage, and had a chronic fear of being surrounded, as it was the plan of Lord Roberts with his superior forces invariably to surround them. The costliness of the frontal attacks of Lord Methuen on Magersfontein and of Sir Redvers Buller on the Tugela defenses determined him to avoid such tactics in the future, but Lord Kitchener, in attacking Gen. Cronje's retreating force at Drieputs on Feb. 16, departed from the rule, and suffered heavy loss in consequence. The Boer generals had no European advisers except for the handling of artillery, and the Boers themselves displayed resourcefulness in turning all sorts of guns to a useful purpose, whether they were field guns, naval guns, or guns of position. There were about 1,000 trained gunners under Col. Trichardt. The Boers had lost only 4 men killed and 25 wounded of their artillery force during the entire previous course of the war, and of their material only 1 Krupp quick-firing gun, 2 Nordenfelts, and 1 Maxim-Nordenfelt, while 2 howitzers were rendered useless. They took from the British 4 mountain guns at Nicholson's Nek, 10 15-pounders at Colenso, and 5 15-pounders and 2 Maxims at Koornspruit, otherwise known as Sannaspost, and all these they employed against their former owners. The Boers had ordered 20 batteries of Creusot guns, but could not get them delivered. The foreign volunteers fighting for the Boers, exclusive of the Uitlanders of the Rand, were 120 Russian scouts, 100 American scouts under Capt. Hassell, 150 Germans, 100 Irish, 100 Italians, 200 French, and 200 Dutch. The Uitlanders fighting on the Boer side numbered over 5,000, consisting of 300 in the Irish brigade, similar Dutch, French, Italian, and Scandinavian brigades, and about 500 Irish and Irish-Americans, a larger number of Dutch and of Germans, and smaller numbers of the other nationalities, including a few English, scattered among the Transvaal and Free State commandos. The total strength of the Boer forces in the field, including Boers, Afrikanders from the Cape and Natal, Uitlanders, and foreigners, hardly ever exceeded 35,000 at one time. After the death of Gen. Piet Joubert, who latterly was not able to direct active operations in the field, Lord Methuen, whose diminished division occupied Kimberley while Lord Roberts was driving the Boer army back upon Bloemfontein, sent out an expedition for the relief of Mafeking, where a British force under Col. Baden-Powell had been closely besieged for many months. Col. Keke-wich, the late commandant at Kimberley, conducted a second expedition through Griqualand, but in every case when the British were not present in force the inhabitants rose in arms. The march through a desert country, with enemies in both front and rear, could not be made from the south. Col. Plumer, who attempted to break the siege from the other direction, had an insufficient force, but was able to create a diversion by threatening Zeerust. Gen. Villebois-Marcuil, a French officer whose services were of great value to the

Boers, was surrounded with 68 foreign volunteers at Boshof by a force of British yeomanry, and was killed in the action. Lord Methuen's northern advance from the vicinity of Hoopstad was brought to a stop with daily losses.

The Boers had, while Lord Roberts remained inactive at Bloemfontein, about 34,000 men in the field, of whom 12,000 held the Biggarsberg line of defense in Natal, 12,000 were in the Free State north, east, and south of Pretoria, 5,000 were at Fourteen Streams, 5,000 were scattered along the northern and northwestern border, and 2,000 beleaguered Mafeking. There was a reserve of about 6,000 more, who were employed as frontier guards, on commissariat service, in the Rand police, and in permanent garrisons at various points. The losses had been 5,000 captured at Paardeberg and before, 1,000 killed, 3,000 wounded, of whom half were again in active service, and 1,000 disabled by illness. The English captives at Pretoria numbered 6,000. Gen. Louis Botha was on April 19 appointed commandant general of the Transvaal army, and Schalk Burger became Vice-President of the Republic. President Steyn and the other Free State officials established the capital of their republic at Kroonstad after they fled from Bloemfontein.

An advance of the British from the south, joined by cavalry and light artillery from Bloemfontein, drew off the Boer commandos that were roaming south and southeast of Bloemfontein, harassing the line of railroad communications, which up to this time could not be fully restored, and keeping alive the spirit of resistance in the Free State and the active sympathy of the Cape Dutch. The reinforcements of yeomanry and other troops from England and fresh horses and transport animals reached Bloemfontein before the movement was undertaken. Till then Lord Roberts was hampered by illness among his men and his beasts and by the transport difficulties for the immense food supplies over the railroad to Kimberley, and from there by a desert road. The Boers had a strong position near Dewetsdorp, which was occupied after some fighting by Gen. Chermiside's division from the south on April 25. The waterworks were retaken by Gen. Ian Hamilton. Gen. French endeavored to place himself across the line of retreat crossing the Modder at Valsbank, and this compelled the Boers to save themselves by abandoning the siege of Col. Dalgety's colonials at Wepener and to fall back from Dewetsdorp toward Ladybrand. Gen. Brabant, who was expected to relieve Wepener from the south, arrived after the Boers had disappeared. Gen. French caught up with the Boers' rear guard at Thaba Nchu on April 27. The retreat was conducted by Gen. Louis Botha. Gen. Grobelaar's commando and various scattered parties, including 2,000 special service volunteers on parade commando, well-mounted troops impeded by no transport, each man carrying provisions for eight days in his saddlebags, were still operating southeast of Bloemfontein. The column that cleared the south of the Free State from Boers consisted of the divisions of Gen. Chermiside and Gen. Pole-Carew, with mounted yeomanry, colonials, etc., the whole force numbering about 12,000 men under the command of Gen. Rundle.

Boer Appeal for Intervention.—On March 5 the presidents of the Orange Free State and of the South African Republic addressed overtures of peace to the Marquis of Salisbury on the condition that the independence of both republics as sovereign international states should be assured, and that British subjects who had taken part in the war with the republicans should suffer no harm in person or property. Lord Salisbury replied on

March 11 that for having in recent years acquiesced in the existence of the two republics Great Britain had paid the penalty of having the two colonies in South Africa invaded and overrun, with great destruction to property and life, and large portions of the British dominions claimed as having been annexed to one or the other of the republics, entailing a costly war and the loss of thousands of lives; and in view of the use to which the two republics had put the position which was given them, and the calamities which their unprovoked attack had inflicted upon the British dominions, the British Government was not prepared to assent to the independence either of the South African Republic or of the Orange Free State. The two presidents at the same time addressed an appeal to each of the European cabinets and to the Cabinet at Washington, asking for the intervention of the powers to bring about a peace based on the independence of the republics. Because the British Prime Minister had declared unofficially at the beginning of the war that no proposals for arbitration or conciliation would be considered and because the British Government had already declined to accede to the independence of the republics, none of the Continental powers were willing to undertake mediation, nor were they moved by the pleadings of Boer envoys or of President Kruger, who was received with honor in France, but was deterred from going to Germany by the refusal of the Emperor Wilhelm to receive him, and went to Holland, where he had the sympathy of both the people and the Government. The American Government, receiving the appeal for intervention on the day preceding Lord Salisbury's rejection of the Boer proposal, communicated the request to the British Government, expressing the hope that a way to bring about peace would be found, and offering the good offices of the United States to that end. The British Government replied that no intervention of a foreign power would be acceptable. When the Boer delegates who came to the United States later endeavored to move the administration to take further steps to apply the principles of The Hague peace convention, they were reminded that the very terms of the convention indicated the inadvisability of further action after conciliation had been refused.

Occupation of Pretoria.—At the beginning of May Lord Roberts was ready to advance northward with an army of over 60,000 men, enough to occupy a broad front extending beyond the Boer line of defense. He planned to turn the position on the Modder by an advance from Thaba Nchu, the columns wheeling with Karee on the railroad for their pivot. Gen. Botha, who had brought away the Dutch raiding columns from the south without losses, and held together the forces of the two republics, anticipated the turning movement, and had a strong force to oppose Gen. French's progress on the British right flank from Thaba Nchu to Brandfort, which was undertaken on May 1, after the road bridge over the Modder at Klipdrift and the hills near Karee had been occupied by mounted infantry. The front therefore extended over 40 miles. The Boers adapted their tactics to the open ground on which they had now to fight for the first time. They had strong reserves in close columns, and met the British advance by a heavy shell fire, followed by the direct onset of swarms of riflemen, which were re-enforced when driven away, enabling them to hold their ground until the weight of the British infantry pressed them back. Gen. Ian Hamilton's column forced a passage northward from Thaba Nchu, and after several lines of kopjes were taken

by the Canadians, the Gordon Highlanders, and the Shropshire regiment on May 2, the Dutch forces were withdrawn from the hills around Thaba Nchu and massed northward and eastward, where they clung to the flanks of the columns that marched along the Winburg road. Brandfort was occupied on May 3, Gen. Delarey retiring his forces to the hilly country to the northeast, into which Lord Roberts refused to be enticed. The effective British field force operating in South Africa consisted of 128,000 regulars, 1,000 marines, 20,000 militia, 8,000 yeomanry, 10,000 volunteers, 25,000 colonial troops raised in South Africa, and 8,000 from other colonies, making a total of 200,000. The last contingents from England consisted of 17 battalions of militia and 3,000 yeomanry, and from the colonies 5,000.

The beginning of the British advance brought about new dispositions of the Boer forces. The bulk of the besieging force was recalled from Mafeking just as Col. Mahon's relieving column which had formed a junction with Col. Plumer's party, making a force of 2,300 men, came to the succor of the starved and exhausted garrison on May 17. A Boer commando attacked the column on May 13, inflicting a loss of 31 men, and on the same morning Capt. Eloff led a storming party of 150 men, which forced an entrance into the town, was cut off in the rear, and found internal fortifications that stopped further advance, and after fighting all day and losing 29 killed and wounded, surrendered, the British loss having been 6 killed and 11 wounded.

To prevent the concentration of all the Boer forces on his front Lord Roberts ordered a simultaneous advance from Kimberley against the burgher divisions in the west and in Natal upon the Biggarsberg line of defense. The advance to Winburg and Kroonstad could not be safely made until the gap southeast of Bloemfontein was effectually closed by the occupation of the line from Thaba Nchu to Ladybrand. The Boers prepared for the invasion of the Transvaal by ordering all British subjects to leave the country. The Boers had prepared to defend Brandfort stoutly. 4,000 strong, but were forced to retreat hastily to escape being surrounded. The British reached the Vet river on May 5, and Gen. Hutton's mounted infantry had a severe engagement with the Boers, who retreated when their right flank was turned. At Smaldeel junction a quantity of stores were captured. The British were now in possession of the railroad, which was not much injured except that the bridge over the Vet was gone. Gen. Ian Hamilton's force, with Gen. Broadwood's cavalry and some mounted infantry, advanced independently toward Kroonstad, driving the Boers out of a strong position at Houtnek, reaching Neal Welkot on May 4, and on May 6 taking possession of Winburg. Senekal was occupied, and the column moved on to Ventersburg. The principal advance of the British was along the line of the railroad, and the main body of the Republican troops fell back toward the Zand river and Kroonstad. The country was hilly, and yet not well adapted for defense. The Boers made a stand north of the Zand at Rietspruit, where Lord Roberts attacked them on May 10 with 35,000 men. They occupied a line much too widely extended for their numbers, intending to fight for delay. The greatly superior strength of the British broke through their defense without difficulty, and on May 12 Lord Roberts entered Kroonstad without further opposition. A demonstration against Thaba Nchu was attempted by the Boers prior to the last battle, but this did not divert Lord Roberts from his objective because Gen. Rundle's

division, re-enforced by Gen. Brabant's force, could deal with the countermarching commandos. President Steyn removed his Government to Lindley, but fled from there when Ian Hamilton's cavalry arrived on May 17 to capture him. The Boers had defended their position on the Vet with little spirit, and when the British forces approached the intrenched position that they had prepared on the Rhenoster river they abandoned their fortifications without a blow, and retired across the Vaal, destroying one span of the railroad bridge at Vereeniging after they had crossed. On May 26 the British vanguard crossed the Vaal near Parys, and on the following day the main body encamped in the Transvaal, having crossed in four places with a front of 35 miles without encountering serious opposition, the Boers having been misled as to the passage by Gen. Hamilton's operations at Lindley and Heilbron and the British having rapidly changed their front from northeast to northwest. The rapid advance on Vereeniging saved the coal mines on both sides of the river from being crippled as those in northern Natal were to prevent the British from using the railroads for transport. By a march of 20 miles on May 28 the main column reached Klip river and drove away the Boers who were there to contest the advance. At Klip River Berg they were erecting fortifications to defend the approach to Johannesburg from this direction. Lord Roberts had, however, sent Gen. French's cavalry to make a *détour* to the west of Johannesburg. While the Boers were still busy preparing for the defense of the Witwatersrand, the British vanguard passed on to Germiston, and seized the railroad junction. The mounted troops that went round the Boer positions on the left seized the railroad at Elandsfontein, and thus stopped the re-enforcements coming from Heidelberg and Natal. The advance was so rapid that the Boers had no time to organize effective opposition. The lines of communication were held by the British, although an attempt to cut the railroad between Heidelberg and Pretoria had failed, the mobile column sent round on the east having been beaten. Gen. Botha had prepared several positions where he intended to oppose the British, but his men abandoned their unfinished fortifications when the enemy came near. The kopjes and ridges south of the Rand were cleared by Gen. Hamilton's column, which worked round to the west of Johannesburg, while Gen. French's cavalry seized the important positions on the other side and two whole divisions followed, taking positions on the north and the south. The main body of the British consisted of two infantry divisions with auxiliary arms. The mounted troops under Gen. French and the column under Gen. Ian Hamilton moved from the Vaal drifts westward and advanced in a parallel line against the Boer camp at Klip River Berg. On May 28 Major-Gen. George Pretymann, who was appointed Military Governor at Bloemfontein, proclaimed the annexation of the Free State under the designation of the Orange River British Colony. On May 28 Gen. French's column engaged the Boers under Gen. Louis Botha at Gatsrand, and were held in check until re-enforcements arrived, when the Boers retired.

Pretoria was not provisioned for a siege and was deprived of the guns that were formerly mounted in the forts, but were taken away to be used in the Natal campaign and could not be brought back. At the request of the United States consul, Adelbert Hay, the Boer authorities before leaving liberated 20 British officers with the object of preventing disturbances among the British prisoners of war. President Kruger and the other Transvaal officials went to Waterval Boven on the way

to the hilly Lydenberg district of northern Transvaal, where great quantities of ammunition and provisions had been accumulated. Commandant Krauss surrendered Johannesburg to Lord Roberts on May 31. The mines, which it was feared might be destroyed by the Boers, were found intact, some of them having been in continuous operation during the war. The rapid movement of Lord Roberts's army, which entirely disconcerted the Boer generals and gave them no chance to offer any formidable resistance, was mainly due to the transport service organized by Lord Kitchener. Johannesburg was completely surrounded by various British divisions before the Boers had completed their dispositions for the defense of the Rand, and the overwhelming numbers of the British, holding the roads, compelled the commandos that were posted in points of vantage to make their escape with their artillery before it was too late. Several guns were captured, with many wagons of stores and ammunition, and numbers of burghers gave up their rifles and horses. The foreigners who had been fighting with the Boers or working in the arsenals crowded the trains for Delagoa Bay.

The Boers after evacuating the Rand took up a position at Six Miles Spruit to contest the advance to Pretoria. The leading column of the British arrived there on June 4, cleared one bank of the spruit with a swarm of mounted infantry and the other with a few rounds from the heavy guns which had been placed in the fore part of the column for the purpose, and frustrated the efforts of the Boers to get at the flank and rear by deploying a great force of mounted troops. The first attempt of the British to chase the Boers was foiled by a heavy fire from masked guns, but before night the Boers were driven from all their positions and sent fleeing through Pretoria, and the British artillery began to bombard the Pretoria forts, upon which Gen. Botha offered to surrender the capital. Lord Roberts entered and took possession on June 5. The commissariat and supplies of Gen. Botha's army were completely disorganized, and the Boers were disheartened because their resistance had been so easily brushed away by the overwhelming British force. The annexation of the Orange Free State stirred up a spirit of resistance and resentment among all the Dutch of South Africa that was destined to put new life in the defense of the republics, since it was now clearly apprehended that they had to fight for their political existence. The Afrikanders of Cape Colony held a people's congress at Graaff Reinet, at which they affirmed that the majority of the colony ascribed the war to the intolerable, unwarrantable, and unconstitutional action of the British ministers, and condemned the annexation of the conquered territories, asserting that the only means of securing peace and tranquillity in South Africa was to restore the unqualified freedom of the republics and to give the Cape Colonists a voice in the choice of their governor, so as to abolish the need of standing armies to control the people. By the capture of Pretoria Lord Roberts released 151 officers and 3,500 men who were held there as prisoners of war, but 10 officers and 900 men were taken away by the Boers and placed in confinement at Nooitgedacht. The prisoners had fared far better than the Boer captives at Simonstown, who were confined in prison ships and in cramped, dirty, insanitary quarters in the fortress, where as many as 40 deaths occurred in one week from typhoid fever and filth diseases. Such treatment of the men who stood the bombardment of Paardeberg with lyddite shells for ten days and the exile of the prominent ones to St. Helena and Ceylon helped to embitter the feelings of the Dutch toward

the British Government. The sentiments of the colonists were aggravated still further by the determination of Sir Alfred Milner to punish as traitors those of their numbers who had volunteered to aid their brothers in the republics in the defense of their independence. When Lord Roberts adopted later the mistaken policy of burning farmhouses and deporting the women and children as a means of bringing pressure upon the men in the field he only prolonged the conflict, because the Boers whose possessions were destroyed and whose families were broken up had no motive to cease fighting, but a deep motive to continue the conflict to the last. As soon as he entered the Transvaal Lord Roberts issued a proclamation to the effect that burghers who had not taken a prominent part in the policy that led to the war and were willing to lay down their arms and bind themselves by oath to take no further part in the war would be allowed to return to their homes, and after the occupation of Pretoria he announced that such burghers would be allowed to retain possession of their stock or would receive the current market value for it if it were required for the troops. The stock of burghers still under arms could therefore be seized as spoils of war.

The northward advance of the British from Bloemfontein drew the Boers away from Natal in great numbers, weakening the line that had held the Biggarsberg range against the repeated assaults of Gen. Buller's greatly superior force. The Boers could not be held in Natal when their homes in the rear were exposed to the flying columns of Lord Roberts's army, and when railroad communication with Pretoria was threatened. On May 7 Gen. Sir Redvers Buller began the advance which had been planned in combination with the movement of Lord Roberts in the Free State. Moving out from around Elandslaagte, the van of Gen. Buller's army reached the drift of Sunday river on May 9, and Thornycroft's mounted infantry occupied the high hill of Indoda, which for two months had been the Boer advanced post and outlook. With Lord Dundonald's cavalry guarding the flanks, the army wheeled around, with Indoda as the pivot of the movement. Gen. Buller planned a simultaneous attack on the Biggarsberg position by the main column from the south and southeast and by Col. Bethune's mounted column from the east. The Boers expected a frontal attack near Beith, but not a circuitous movement flanking their position from beyond Helpmakaar and from Pomeroy. On May 13 the battle was opened by artillery in the vicinity of Beith, and the British naval guns continued firing after the Boers had taken their guns away. The hill of Uithoek, near Helpmakaar, was seized by Thornycroft's mounted men, who moved eastward and formed a junction with Col. Bethune's cavalry. When the Boers saw the British on their extreme left they moved eastward, racing on the crest of the range with the mounted British troops in the valley, both striving to occupy first the high ground about halfway between Pomeroy and Helpmakaar. Col. Bethune's men reached the goal first. The Boers evacuated Helpmakaar in the night and Dundee the next day.

Gen. Buller had been instructed merely to keep the enemy occupied in Biggarsberg. His turning movement compelled the defenders who were left to abandon their line of defense, which was impregnable if strongly held. The Boers retreated by railroad from Glencoe, which was occupied by the British on May 16. They followed up the Boers to Newcastle, where they were kept in check by artillery and infantry fire until the burghers departed on the cars. A squadron of mounted in-

fantry fell into an ambush near Vryheid, and few escaped capture or death. The Boers continued their retreat by rail toward Heidelberg, and as soon as they evacuated the country the British occupied Utrecht, Volksrust, and the other places. The burghers still held positions of great natural strength from which they could impede the northward march of Gen. Buller's army. They were expelled with difficulty from Dornberg, east of Newcastle. On May 30 Gen. Clery bombarded Lang's Nek, where the Boers had made intrenchments and placed guns in position. They occupied Majuba also, and Pongwana, a fresh commando having arrived to stop the further advance of Gen. Buller's army.

In the west, Gen. Hunter crossed the Vaal at Windsorton, occupied Fourteen Streams on May 7, the Boers retreating hastily and abandoning stores and ammunition, and sent a flying column toward Mafeking, which occupied Vryburg on May 9. This was the column that entered Mafeking on May 17. Sir F. Carrington was at the same time marching to the relief of the brave garrison and the people of Mafeking, who had endured the sorest privations and withstood the most persistent assaults, not because any military advantage would be lost by surrender or gained by the Boers, but because it had become a point of honor on the part of the British to keep their flag flying and on the part of the Boers to lower it. Gen. Carrington brought his troops into Rhodesia by the Beira Railroad with the permission of the Portuguese Government, which defended its act of complaisance to England on the plea of an ancient alliance. Lord Methuen entered Hoopstad without opposition on May 18. Gen. Duprez and Gen. Daniels surrendered to the British, with a few of their men. While the main army under Lord Roberts was advancing up the line of the railroad from Bloemfontein to Johannesburg and Pretoria, Lord Methuen's division continued its march through the Orange Free State to Heilbron in order to occupy the places that were left behind by the troops invading the Transvaal and to guard the communications in conjunction with Gen. Rundle's division, which marched northward east of the railroad through Senekal, while Gen. Brabant's horse scoured the neighboring country. Before the arrival of these troops a force of Boers made prisoners of a whole battalion of yeomanry that was intrenched at Lindley. Lord Methuen by a forced march attempted a rescue, but arrived too late.

Campaign of De Wet and Botha.—President Kruger established a new capital of the South African Republic at Machadodorp, and President Steyn made Bethlehem the seat of Government for the Orange Free State. While the British were endeavoring to organize a new rule at Pretoria and Lord Roberts, with less success than at Bloemfontein, was inviting the burghers to deliver up their arms and return to their farms, the Boers developed fresh activity in his rear and struck at his lengthened line of communications. On June 4 Commandant de Wet captured north of Rhenoster a convoy of 55 wagons, containing food, clothing, and ammunition on the way to Heilbron. He cut the telegraph and tore up the railroad at Roodeval, north of Kroonstad, on June 5, and two days later made captives of all the men of the Derbyshire regiment except 35 killed and 111 wounded. This was accomplished by a detachment of the army that Gen. de Wet had assembled in the Bethlehem district, which posted guns unobserved on the heights surrounding the camp. Gen. Louis Botha rallied and reorganized his forces east of Pretoria. Gen. de Wet held a line extending along the mountain ranges from Ficksburg on the

Basutoland frontier 40 miles northwestward nearly to Senekal, and from that point eastward for a like distance to Bethlehem. Gen. Rundle's division, resting on the railroad from Winburg, was unable to take the offensive, and stood in danger of having its communications cut off. Troops were moved down from the north to relieve the pressure. Gen. Rundle announced to the Boers who were fighting that unless they surrendered within three days their farms and all their possessions would be confiscated.

To the dismay caused by the defeat of the Boer forces before Johannesburg and Pretoria and the flight of the President was added mistrust because President Kruger took with him £2,500,000 of gold. Gen. Botha retired to a fortified position at Pienaar's Poort, 12 miles east of the city. He had a small force at first, which grew rapidly until he was able to stop the supplies that the British were collecting in the country. Even before the surrender of Pretoria, when it was seen that Gen. Botha's plan of defense must fail, some of the military leaders as well as civilians were disposed to treat for peace, and afterward negotiations were carried on with Gen. Botha until Gen. de Wet succeeded in cutting the British communications. The burghers in Pretoria were greatly encouraged by the rapid resumption of Boer activity, and ceased to surrender arms, whereas 5,000 Mauser rifles had been delivered up till then, so that Lord Roberts determined to attack. Botha's position in front was so strong that he could place most of his troops on his flanks, which the British assailed with two strong columns, which were repulsed on June 11, but renewed the attack on the following day and drove the Boers back to a second position, which was evacuated when they saw that they were nearly surrounded. Gen. Ian Hamilton overtook the rear guard and was wounded in the action that ensued. Gen. Botha fell back on Middelburg.

Gen. Buller in Natal forced Botha's pass on June 8, threatening the communications of the Boers, whose fortified position at Laing's Nek stopped his advance along the line of the Durban Railroad. Many of the Boers had gone to re-enforce Gen. Botha, and many others now retreated. Volksrust, Wakkerstroom, and Charlestown were occupied without much opposition. The flanking force that marched round by the Drakensberg mountains had several fights, and before Laing's Nek was surrounded and abandoned by the Boers on June 13 the British losses amounted to 30 killed and 130 wounded. Heavier losses were inflicted on the retreating Boers at Almond's Nek. Natal being cleared of Boers, Gen. Buller entered the Transvaal and established contact with the troops of Lord Roberts, whose plan was to establish a chain of posts between the forces of Gen. Botha and Gen. de Wet and to open the railroads to Durban and Delagoa Bay. When all his columns joined hands he was still unable to stop entirely the raids of Christian de Wet on the Bloemfontein Railroad, and it was long before he held the other railroads. Krugersdorp, Potchefstroom, Frankfort, Standerton, Ameersfoort, and other towns were occupied, but without strong British garrisons they were always open to the Boers, who were able to traverse the two republics from one end to the other in armed parties without fear of the British and without their knowledge.

The armies of De Wet and Botha baffled for months the skill of Lord Roberts and Lord Kitchener. Botha held his own only a few miles west of Pretoria and kept a large part of the British army there. When troops were sent south to pursue De Wet he resumed active harassing operations,

and when they were recalled to drive him away De Wet struck heavy blows. The British kept 200,000 men in South Africa to garrison the towns, guard the railroads from Cape Town, Durban, and Delagoa Bay, and hold in check the forces of the two Boer generals and other scattered commandos, and for this their force, although comprising the entire available military strength of the British Empire, was not sufficient. Commandant de Wet captured in June enough winter clothing for all the burghers in his army, 3,700 shells, and small-arms ammunition sufficient for three years' campaigning. The operations against him were conducted by Lord Kitchener, who for three months tried in vain to hem him in with 40,000 troops, twice as many as his force and Botha's combined. The Boer ammunition ran out soon after the fall of Pretoria. The stores captured from the British, however, supplied the rifles, cartridges, and shells that enabled the Boers to continue the conflict, and all the commissariat supplies that were needed for the Boer soldiers and their horses. When the first attempts were made to sever railroad communications in the rear of Lord Roberts' army he gave notice that farms would be destroyed and stock confiscated for 10 miles on either side of the line wherever the railroad or the trains were meddled with. His military failures led him to apply with greater stringency the method of holding the farms, cattle, and families of the fighting burghers as hostages to induce them to surrender, and even to threaten to confiscate the property of the burghers who were on their farms as a means for bringing pressure on those who were in the field. Lord Kitchener carried this policy for a time to extremes. The homes of the Volksraad members of the Free State and the Transvaal were destroyed for the reason that the British blamed these men for having brought on the war. The territory of both republics was dotted with the ashes of ruined homes, and the practice of destroying farms did more than anything else to keep the burghers in the field. Whenever a Boer commando came to a farmhouse or passed over a farm it was customary to burn the buildings and seize the stock in accordance with a proclamation of Lord Roberts against harboring rebels, as the Boer soldiers were called after the annexation of the republics was proclaimed. Away from the garrisoned towns and the lines of railroad patrolled by the British the Boers moved freely and unobserved, and for a long time no British movement was safe unless carried out with a force as strong as one of the Boer armies. After Commandant de Wet had accomplished his first successful raids on communications Lord Kitchener brought a flying column from Vereeniging to put a stop to such operations, and Lord Methuen hastened with his column from Heilbron to fill the gap that Lord Roberts had left in his bold movement on Pretoria, which would have been less successful if Commandant de Wet had struck before Commandant-General Botha's main line of defense was broken, entailing the immediate loss of Johannesburg, the fall of Pretoria, and the consequent military and political demoralization. The commandos of De Wet and Nell retired after a brush with Methuen's and Kitchener's combined forces, but not before a party had attacked a construction train that was repairing the damage done to the railroad. Strong posts with artillery were established all along, and armored trains with machine guns patrolled the line to prevent its being cut again. Gen. Cronje surrendered Klerksdorp, and one or two of the other Boer commandants gave up when the British appeared because they considered the war over. Commandant de Villiers surrendered in Cape Col-

ony. Gen. Baden-Powell traversed the northern part of the Transvaal, taking possession of Rustenburg and other places and receiving the surrender of numbers of Boers.

The operations by which Gen. Botha was driven from the vicinity of Pretoria and the movements undertaken to restore and protect railroad communication with the south necessitated another halt, the cavalry and mounted troops being again exhausted. Gen. Ian Hamilton having occupied Heidelberg on June 23, Lord Kitchener went to Kroonstad to begin a campaign against Commandant de Wet, whose raids on communications and captures of convoys and detached bodies of troops had a political effect that was more serious than their military importance warranted. Gen. Hunter, who had temporarily taken over Gen. Ian Hamilton's command, advanced on July 1 to Frankfort to co-operate with columns under Gen. Paget, Gen. Clements, and Col. Hickman in an encircling maneuver in the southeastern corner of the Free State, the object of which was to enfold Christian de Wet's little army as in the coils of an anaconda. The operations were partly successful, and had the result of breaking up the last cohesive fighting body among the Boers of considerable strength that operated from a regular base. The town of Bethlehem, which had been President Steyn's capital, was taken on July 7, Clements and Paget having closed in on it from two directions. A cordon was established from Bethlehem to Ficksburg by the divisions of Gen. Hunter and Gen. Rundle joining hands, but it did not hold Christian de Wet, who broke through, with Gen. Broadwood's cavalry in pursuit, attacked Gen. Little's brigade near Lindley, divided his force into two parties, one of which was engaged by Broadwood, crossed the railroad at Honing Spruit on July 21, captured a supply train with 102 Welsh fusileers, and moved northward toward the Vaal river, being so lightly equipped that he could easily outstrip the British cavalry although carrying abundant supplies. Commandant Piet de Wet, who had offered to surrender before if Lord Roberts would promise not to deport his men, went into Kroonstad, where his commando laid down their arms. The cordon was drawn closer round the remaining Boer forces in the Bethlehem district, mostly local farmers under Commandant Prinsloo. They fought stubbornly from intrenched positions at Relief's Nek and Stabbert's Nek, from which they were driven by artillery into the narrow basin of the Brandwater, and blocked in on every side by Clements, Paget, MacDonald, Bruce, Hamilton, and Hunter's division advancing from Fouriesburg. Gen. de Wet had taken with him 5 guns, the best they had. On July 29 Gen. Prinsloo surrendered in the valley of the Little Caledon after being shelled with lydite. Over 4,000 men gave up their arms and horses and 3 guns, and were deported to Ceylon. Commandant Olivier with 1,500 men and 5 guns escaped by the mountain road to Harrismith.

Gen. de Wet's arrival in the north was followed by an outbreak of Boer activity west of Pretoria. Lord Roberts was trying to keep open the railroad to Klerksdorp as well as to open up the Natal railroad so as to join hands with Buller, who was working his way slowly toward Heidelberg, repairing the railroad which the Boers destroyed in his front and rear. Lord Roberts was preparing also to send a force against the Boers at Middelburg and to clear the railroad to Delagoa Bay to Machadodorp, where President Kruger had established himself, ready to slip into Portuguese territory and take ship for Europe if the British appeared, and whence he sent continually to the Boer commandos

supplies that were landed at Lourenço Marques. A train was wrecked on the Klerksdorp Railroad. Rustenburg was besieged by a Boer force until Methuen's division arrived from the south. While Gen. Smith-Dorrien was driving the Boers from near Krugersdorp Gen. Grobler's commando captured a squadron of cavalry, three companies of the Lincolnshire regiment, and two guns, the garrison that was holding Nitrals Nek, 18 miles from Pretoria on the road to Rustenburg, the officers having neglected to occupy the hills commanding the camp. Simultaneously other attacks were made on the British right, which were beaten off with difficulty. Gen. Pole-Carew's division, guarding the railroad to Johannesburg, was attacked vigorously, and Grobler routed the garrison at Derdepoort, 5 miles north of Pretoria.

On July 24 Lord Roberts began his general advance against Commandant-General Botha's positions on the Delagoa Bay Railroad, which the Boers quickly evacuated. Gen. French occupied Middelburg on July 27. Renewed aggressive tactics of De Wet and Grobler led to Lord Methuen's marching to the south again to co-operate with Knox and Broadwood in the attempt to capture De Wet and in defending against his raids the trunk railroad. Gen. Ian Hamilton's mobile column was sent back from Middelburg to check Commandant Grobler, who replenished his supplies by upsetting a train near Frederikstad and held Gen. Baden-Powell's command besieged in Rustenburg while Commandant de Wet captured a supply train south of Kroonstad. To counteract the British policy of burning farms in order to induce Boers to surrender, President Kruger and Gen. Botha promised to repay such losses if the burghers would remain on commando. Gen. Hamilton cleared the Boers from the Magaliesberg and reached Rustenburg, but neither he nor Sir Frederick Carrington, marching from Zeerust, had force enough to rescue the garrison of 300 men at Elands river, which had undergone a ten days' siege by Commandant Delarey. Lord Methuen failed in his efforts to intercept De Wet, who crossed the Vaal and joined Grobler in the bush veldt southwest of Pretoria. Attacks on the Delagoa Bay Railroad in the rear of the column that was advancing to Machadodorp were requited by the burning of all farms in the localities where they occurred. For a plot to kidnap Lord Roberts 15 citizens of Pretoria were arrested on Aug. 10. It came out at the trial that the plot had been suggested to the ringleader, a paroled Boer lieutenant named Cordua, by a detective in British pay. A plot to overpower the British garrison in Johannesburg was reported in July, and about 400 Germans, Frenchmen, Swedes, and Americans were deported. The employees of the Netherlands Railroad Company were banished previously.

Lord Kitchener joined with a large force in an effort to close in on De Wet and President Steyn in the Gatsrand. Gen. Buller marched northward to establish communications with Gen. French's force, which had advanced on the Lourenço Marques Railroad to Wonderfontein, when Buller, after slight resistance from Christian Botha's commando, occupied Ermelo on Aug. 11. Commandant Delarey increased his force in the western districts of the Transvaal that the British thought they had pacified, until Sir Frederick Carrington's Australian and Rhodesian troopers were compelled to evacuate Zeerust and retreat to Mafeking, and Gen. Ian Hamilton to retire from Rustenburg to Pretoria with his cavalry division and Gen. Baden-Powell's exhausted troops. In this, as in other districts that the British were forced to evacuate after promising protection to the burghers who

submitted, the Boers wreaked vengeance afterward on those who had given up their rifles. Many Boers when the British were in possession of their district offered old muskets and shotguns. Lord Roberts, suspecting that many of the burghers who subscribed to the oath of neutrality afterward rejoined their commandos when the Boers became active in their neighborhood and the British retired, revoked his former proclamation permitting them to remain on their farms, and subsequently he attempted to carry out a plan of internment the civil population in guarded cantonments close to the British camps. It was announced in the proclamation of Aug. 18 that burghers residing in districts occupied by British troops unless they took the oath of neutrality would be deported, and that if they took the oath and afterward broke it they would be punished with death or imprisonment. The Boers were not less rigorous, forcing burghers who had taken the oath to join their commandos on pain of being shot, actually shooting those who gave willing aid or information to the English, and treating all South African volunteers whom they took prisoners with harsh severity, while English soldiers were treated kindly.

The mounted troops of Gen. Broadwood, the divisions of Lord Methuen and Gen. Smith-Dorrien, and his own active force of mounted Cape Colonists and Canadians, with which Lord Kitchener endeavored to draw a cordon of investment around Commandant de Wet's force, each came in contact with this small but formidable commando, and each of them suffered in a sharp rear-guard action, yet all of them together could not hold this remarkably mobile corps, a part of which dissolved into small bands that roved nearly to the outskirts of Pretoria, while the nucleus that remained with the chief slipped through a gap in the tightening circle and got away with all the guns and the train of supplies and ammunition. Commandant Olivier in the extreme east of the Free State escaped with the other remnant of De Wet's army by doubling back when Gen. MacDonald from Ladysmith occupied Harrismith to intercept him. All concentrated bodies of Boers were out of the Free State by the middle of August. Lord Kitchener pursued De Wet till he lost touch of him, then raised the siege of Elands river. De Wet, passing Commando Nek, demanded its surrender by Gen. Baden-Powell, who with a new command held the position strongly. Gen. Ian Hamilton pushed the Boers out of the Magaliesberg again, capturing two Krupp guns. De Wet meanwhile crossed to the northeast of Pretoria, pursued by Baden-Powell and Paget; then, having escorted President Steyn to where he could safely go on to Machadodorp to confer with President Kruger, recrossed the Magaliesberg range, and returned to the Orange Free State, slipping by Lord Methuen, who marched his men 40 miles a day in the effort to intercept him. Gen. Buller's force had a hard battle on Aug. 24 at Bergendal with Gen. Louis Botha's troops, which were strongly intrenched at Machadodorp, but were pressed at the same time by Gen. Pole-Carew from Belfast, while Gen. French attempted to reach the road north of Machadodorp and cut off their retreat toward Lydenburg. Field-Marshal Lord Roberts was on the field conducting the combined operation. Buller's cavalry rode into a trap and suffered from machine guns and shells at short range, and two companies of the Liverpool regiment wandered into the enemy's position and were annihilated. The position was finally forced by a flanking movement on Aug. 27, and carried by a bayonet charge. Pole-Carew's simultaneous ad-

vance was also stubbornly opposed. On Aug. 28 Gen. Botha retreated toward Lydenburg, leaving 1,800 British prisoners to be released at Nootgedacht.

Guerrilla Fighting.—The action at Bergendal was the last regular battle of the campaign, which degenerated into guerrilla warfare and became more distressing and more bitter in consequence of the retaliatory measures employed on both sides. Commandant Theron began operations in the vicinity of Johannesburg, where hardships were suffered by the civil population remaining in the city, about 30,000, though none greater than the refugees suffered in Cape Town and the other ports, who vainly besought Lord Roberts to let them return to the gold city and resume work. Commandant Olivier led an assault on Winburg, and was himself captured in a sally. New commandos sprang up in the vicinity of Senekal and Bethlehem when De Wet returned to the Orange Free State, and he himself recruited a fresh force around Heilbron. The surrenders of Free Staters to Gen. Hunter at Naaupoort and to Gen. Rundle at Harrismith now ceased. Commandant Fourie bombarded and captured Ladybrand. Another commando threatened Thaba Nchu. The bands of De Wet cut the railroad north and south of Kroonstad and captured a supply train. The western Transvaal also was in arms in spite of the presence of large forces under Gen. Ian Hamilton, Lord Methuen, and Gen. Carrington.

Gen. Buller, starting from Machadodorp on Sept. 1, moved slowly toward Spitzkop, driving the Boers before him through a difficult mountainous country, and Gen. French pressed on to Barberton, which was occupied on Sept. 13. Lydenburg was occupied previously by Lord Dundonald and Gen. Brocklehurst. When the British cleared the railroad to Komatipoort, which was reached on Sept. 24, Gen. Pienaar with about 3,000 Boers went over the border to surrender to the Portuguese, who destroyed their guns and ammunition. The war was regarded by Lord Roberts as practically over except guerrilla fighting, to deal with which large columns were not necessary. The Boers sometimes captured outposts and surprised detachments, and wherever the British were not present in sufficient strength the whole population was hostile. The organization of a military police capable of carrying out the work of pacification under the changed conditions was intrusted to Baden-Powell, a major when in command of the starving garrison of Mafeking, and now a lieutenant general. Up to the end of October the casualties of the war on the British side were estimated at 46,000. The deaths, including 6,482 from disease, had been 11,739. The Boer losses in killed, wounded, and prisoners were believed to amount to 30,000, half that number being prisoners. The annexation of the South African Republic to the British dominions under the title of the Transvaal Colony was proclaimed by Lord Roberts on Sept. 1. The Boers were informed that none of them would be treated as prisoners of war except those who had been continuously in arms and attached to their commandos; that noncombatants who failed to acquaint the troops of the presence of the enemy would be treated as rebels, buildings sheltering the enemy would be razed, and a fine of 2*s.* an acre would be collected on all farms in the vicinity of which railroad tracks were destroyed. Col. Maxwell became Military Governor of the Transvaal. President Kruger and his staff with the archives went to Lourenço Marques. President Steyn returned to the Orange Free State. Vice-President Schalk Burger became acting President of the South African Republic upon the departure

of President Kruger, who before he left the country issued a proclamation declaring the annexations void, as the republics were unconquered and their independence was acknowledged by the powers. The peace delegates in Europe, A. Fischer, C. H. Wessels, and A. D. W. Wolmarans, issued from The Hague an appeal to all nations for intervention and a protest against the action of the British commanders in denouncing and treating as rebels the burghers of the republics, whom until the proclamations of annexation they had recognized as belligerents.

Botha's remaining force, led by Commandant Viljoen, went northward over the mountains with 30 guns. Lord Roberts issued another proclamation calling upon the burghers to lay down their arms, promising that those would not be deported who voluntarily surrendered unless they were prominent military or political personages or foreigners or had broken their oath of submission, and announcing that he would confiscate the stock and supplies of families any of whose members had returned on commando and burn the houses of those who were guilty of sniping. The war meanwhile was actively carried on both north and south of the Vaal by leaders who held isolated British garrisons besieged, captured detachments, usually releasing their prisoners from this time forth after taking their weapons and ammunition, destroyed railroad bridges, and seized supply trains. Louis Botha in the bush veldt of the northeastern Transvaal had a safe base, but could not accomplish much. Delarey to the west of Pretoria was very active, and continued his raids after Grobler, Erasmus, and Theron became quiescent. Christian de Wet, when he gathered his men around him, was the most formidable of all, and kept the whole eastern part of the Free State in a condition in which no British force was safe except in a fortified position. Gen. Charles Knox had the special task of capturing this elusive and resourceful guerrilla chief, and other generals had their forces posted so as to cut off his retreat. Many times he was reported to have been routed or to be completely surrounded, yet at the end of the year he was as formidable as ever, and continued to give occupation to several British generals. When the Canadian and other colonial volunteers returned to their homes Gen. Baden-Powell had 12,000 military police. There were still 200,000 British troops in occupation of the country, and yet parties of Boers could commandeer supplies in Ficksburg, Wepener, Rouxville, Philippolis, and other towns, and in innumerable petty engagements they inflicted almost as great losses on the British as in the regular warfare. Jacobsdal was captured by the Boers after a brave defense. An armored train was captured at Vlakfontein, and a convoy and its escort near Blood river. A train was upset into the Kaap river, and the party sent out to open the line was annihilated. A sharp engagement was fought by Gen. Barton with De Wet at Frederickstad on Oct. 25. On Nov. 6 Col. le Galais attacked De Wet at Bothaville. The fevers and privations incident to the guerrilla campaigning caused increasing mortality. Gen. Rundle marched a column through the eastern part of the Orange Free State from Vrede to Harrismith, meeting considerable opposition, and Gen. French marched from Machadodorp through Ermelo and Bethel to Heidelberg, fighting all the way with the forces of Commandant Smuts and Commandant Hans Botha. In November a plot against the life of Lord Roberts was discovered, in which Greeks and Italians were the conspirators.

It was decided to enroll the British residents in a corps called the Rand Rifles, the Military Gov-

ernor informing them that they would have to bear the military burden in future rather than professional soldiers. The chief reason now for not letting the refugees return to Johannesburg was that the volunteers, who were the most useful fighters, could not then be kept in the field. A land settlement commission under the chairmanship of Arnold Forster studied the question of establishing military settlers on confiscated farms in the Transvaal and Orange River colonies. The new constabulary and other forces kept in garrison could have land after a given term of service on condition that they hold themselves ready as reservists to return to the ranks. Sir Alfred Milner was selected to be the Governor of both the new British colonies and High Commissioner of British South Africa still, but no longer Governor of Cape Colony. Lord Kitchener was appointed commander in chief of the forces in the field, Lord Roberts being summoned to England to succeed Lord Wolseley as commander in chief of the British army. On Nov. 24 Commandant de Wet, who was accompanied in his wanderings by President Steyn, compelled the surrender of 400 troops with 2 guns at Dewetsdorp. From this time strong bodies of Boers gathered in the southern districts of the Free State and began to invade Cape Colony. Gen. Knox once more took up the pursuit of De Wet. Gen. Paget engaged with the joint commando of Viljoen and Erasmus north of Kroonstad at Bronkhorst Spruit, on Nov. 29, and sustained severe losses—a regimental commander killed, 10 officers wounded, and 13 men killed and 59 wounded. Commandant Delarey advanced with a strong commando from the western Transvaal through the Magaliesberg, and on Dec. 13 surprised the garrison at Nooitgedacht, 1,200 strong, and captured 18 officers and 555 men of the Northumberland Fusiliers at Commando Nek after 11 officers and 54 men had been killed and wounded and the ammunition was exhausted. Gen. Clements was compelled to evacuate his camp and retreat.

On Dec. 16 the Boers began an incursion into Cape Colony. When they entered the colony before 80 per cent. or more of the Afrikaner population, led by the chief local officials, joined the commandos in the northern districts of Cape Colony, as also in Bechuanaland and Griqualand. Many of the younger men remained with the commandos when they retreated into the Orange Free State, and of those who returned to their farms the most active and prominent were afterward tried and many of them convicted under the new law of treason enacted by the Cape Legislature or were still in jail awaiting trial. There was no eagerness to join the Boer ranks when the burghers again crossed the Orange river in December, 1900. An Afrikaner congress was being held at Worcester, but under the eyes of the military authorities, who sent a guard of 1,500 soldiers and trained 10 guns on the town. The resolutions recorded the conviction of the delegates that, in view of the deplorable condition into which the people of South Africa were plunged and the grave dangers threatening its civilization, its highest interests demanded, first, the termination of the war that was raging with untold misery and horror, such as the burning of houses, the devastation of the country, the extermination of the white nationality, and the treatment to which women and children were subjected, which will leave a lasting heritage of bitterness and hatred, while seriously endangering further relations between civilization and barbarism in South Africa; second, the retention by the republics of their independence, whereby alone the peace of South Africa can be maintained. Camps

were established at Krugersdorp and Heidelberg, into which the people living on farms were collected. The farms on the Rand were cleared, as it was believed the people supplied food and information to the enemy, and 4,000 persons were assembled in one laager under a military guard close to Johannesburg. Lord Kitchener issued a proclamation on Dec. 20, notifying burghers that if they surrendered voluntarily they would be permitted to live with their families in Government laagers until the war was over.

Gen. de Wet's intention of crossing into Cape Colony in the beginning of December was frustrated by Gen. Knox, who had four columns to head him off and surround him, and his force was hard pressed and abandoned carts and horses at the Karreepoort drift of the Caledon. He broke through the cordon by running the gantlet of two fortified posts and Thorneycroft's artillery through Springhahn Nek in the Thaba Nchu district, losing 1 of the guns he captured at Dewetsdorp and 25 prisoners. Hertzog's commando of 1,000 men crossed into Cape Colony at Rhenoster Hoek and marched on Venterstad. Another force, 2,000 strong, under Phil Botha and Haasbroek, crossed at Sand drift. The general position in South Africa caused Lord Kitchener to ask for re-enforcements, although he had over 210,000 men, of whom 143,000 were regulars, not including Baden-Powell's colonial police and the new Rand Rifles. The total number dispatched to the seat of war from the beginning was 267,311, including about 7,500 drafted from India, 11,000 volunteers from Australia and Canada, 29,000 raised in South Africa, and 10,000 yeomanry, 21,500 militia, and 11,000 volunteers from the United Kingdom. Since Aug. 1 there had been 12,500 re-enforcements arrived. The number killed in battle up to Nov. 30 had been 3,018; wounded, 13,886; died from disease or wounds, 7,786; in hospitals at the beginning of October, 11,927; invalided home, 35,548. The Australasian colonies were invited to send further mounted contingents, and new pecuniary inducements were offered to volunteers in South Africa and the United Kingdom. The ordering of re-enforcements from Great Britain deterred the Cape Dutch from beginning another rebellion when the Republicans appeared among them. The Boers who entered Cape Colony, most of them detached from De Wet's force and in need of the clothing and other supplies that they commandeered in the towns they entered and of the stock that they took from the farms, drove back the bodies of Brabant's horse and Cape mounted rifles that opposed them, but found Colesberg, Burghersdorp, Stormberg, and the other military positions strongly occupied. Gen. Brabant hastened from Cape Town to conduct operations against them, summoning whatever armed force existed in the colony. There was alarm in Cape Town. New volunteer bodies were formed. Martial law was proclaimed throughout all the farming districts, and colonists were warned that if they assisted the invaders they would meet the fate of traitors. The pro-British colonists were armed and assisted the Cape military, while a column was organized by Lord Kitchener to co-operate in the expulsion of the Boers. Hertzog's column occupied Britstown and cut the railroad south of De Aar Junction. The other column, re-enforced by Boers from Zoutpan, seized Philipstown, but retired when Thorneycroft's mounted infantry arrived. Gen. Settle, Gen. Inigo Jones, and Gen. MacDonald were ordered to co-operate against the Boers in Cape Colony, who were finally headed and driven, some northward and some westward, after having penetrated farther into the colony than the invaders

who raised a serious rebellion a year before. Other bands trekked over the western border of the Transvaal into the Vryburg district. While the invasion of Cape Colony necessitated a concentration of British forces in that new focus of disturbance, the commandos in the vicinity of Johannesburg became aggressive and were with difficulty checked by Gen. French. Commandant Beyers, who had been co-operating with Delarey, threatened the railroad immediately south of Pretoria at Kaalfontein, and passed eastward when attacked by the cavalry of Gen. William Knox. In the northwestern Transvaal Gen. Clements was unable to restore British authority in the Rustenburg district. Lydenburg was occupied by Louis Botha, who resumed the offensive, destroyed the railroad at various points, and on Dec. 29 captured Helvetia, killing and wounding 50 of the garrison and taking 200 prisoners. Commandant de Wet gathered together another strong and well-equipped commando and occupied the country between Ficksburg, Senekal, and Winburg, while Gen. Charles Knox could do nothing more than guard the line between Winburg and Ladybrand to prevent him from joining in the invasion of Cape Colony. The enlistment in the United Kingdom of 5,000 yeomen was authorized. New Zealand raised a mounted force of 500 men, half of them Maoris. Militiamen were recruited in Great Britain to bring up the strength both of their own regiments and of the regulars in South Africa. Selected Johannesburg miners, 1,500 to begin with, were allowed to return to work organized as a military body. Volunteer regiments in England were invited to send out officers and men to take the place of those who returned home. Gen. Baden-Powell was careful in selecting the men for the colonial constabulary, who were to receive as a prize the choicest farms in the new colonies and to uphold the power of the British Empire among the Dutch population in the future. The fighting in January was more severe than in December, and in February there were 150 killed on the British side in a large number of petty actions, while 24 officers and 624 men died of disease and wounds. Up to the end of February deaths from all causes amounted to 664 officers and 13,137 men, and 1,763 officers and 40,594 men had been invalided to England, but a large proportion of these rejoined the ranks.

TURKEY, an absolute monarchy in eastern Europe and western Asia. The Sultan is the eldest prince of the line of Osman. Abdul Hamid II, the thirty-fourth Sultan of the Osmanli dynasty, born Sept. 21, 1842, succeeded his brother, Murad V, who was deposed on Aug. 31, 1876, on the ground of insanity. The Sultan is recognized as the Khalif of Islam, the temporal chief, not only within the Ottoman Empire, but by a large proportion of the Sunnite Mohammedans outside. In matters of religion and law the Sultan is advised by the Sheikh-ul-Islam and guided by the decisions of the Ulema, a body of eminent expounders of the sacred books sitting in Constantinople. In civil and political matters the chief executive officer under the Sultan is the Sadrazam, or Grand Vizier. These two functionaries, together with the ministers at the head of the departments of state, form the Privy Council, or Cabinet, which was composed at the beginning of 1900 as follows: Grand Vizier, Halil Rifat Pasha; Sheikh-ul-Islam, Mehmed Jemaleddin Effendi; Minister of War, Riza Pasha; Minister of the Interior, Memduh Pasha; Minister of Justice and Worship, Abdurrahman Pasha; Minister of Marine, Hassan Pasha; Minister of Foreign Affairs, Ahmed Tefik Pasha; Minister of Finance, Reshad

Pasha; President of the Council of State, Mehmed Said Pasha; Grand Master of Artillery, Mustafa Zeki Pasha; Intendant of Religious Endowments, Galib Pasha; Minister of Education, Zundi Pasha; Minister of Commerce and Public Works, Zihni Pasha.

Area and Population.—The area of the Turkish Empire still under the dominion of the Sultan is estimated at 1,111,741 square miles, and the total population at 24,515,500. Including the tributary states of Bulgaria and Eastern Roumelia, Samos, and Egypt, with Thasos, and also Bosnia and Herzegovina, Crete, and Cyprus, now under foreign administration, the total area is 1,576,677 square miles, and the total population 39,810,000. The area of Turkey in Europe, comprising the vilayets of Constantinople, Adrianople, Salonika, Monastir, Kossovo, Scutari, and Janina, is 62,744 square miles, with 6,080,300 inhabitants. Asia Minor has an area of 194,392 square miles and 9,238,900 inhabitants; Armenia, 72,491 square miles and 2,472,400 inhabitants; Syria and Mesopotamia, 209,714 square miles and 4,667,900 inhabitants; Arabia, 173,700 square miles and 1,050,000 inhabitants; Tripoli, 398,900 square miles and 1,000,000 inhabitants. The population of Constantinople is about 1,125,000; Smyrna, 210,016; Bagdad, 145,000; Damascus, 140,487; Aleppo, 127,149; Beyrut, 118,811; Salonika, 105,000. About half the population of European Turkey is Christian. In Asia Minor the Christians form 17 per cent. of the population; in Armenia, 26 per cent.; in Syria, 18 per cent. in the vilayet of Aleppo, 28 per cent. in the vilayet of Syria, 31 per cent. in the vilayet of Beyrut, and 80 per cent. in the Lebanon. Besides the Moslem religion the Turkish Government recognizes the Franks, or Roman Catholics, the Greek Orthodox Church, the Armenians, the Syrians and United Chaldeans, the Maronites of the Lebanon, Protestants, and Jews.

Finances.—Out of a total revenue of £ T. 18,500,000, the public debt absorbs £ T. 6,500,000. Various revenues are hypothecated for the debt and placed in charge of a foreign Council of Debt Administration, which in the financial year 1900 received £ T. 2,274,378, of which £ T. 1,125,527 came from the indirect taxes on liquors, salt, stamped paper, fisheries, silk, etc., £ T. 702,887 from the tobacco *régie*, £ T. 90,000 from tithes on tobacco, £ T. 202,702 from the Eastern Roumelian tribute, £ T. 102,596 from the share of revenue of the island of Cyprus, £ T. 50,000 from customs duties on Persian tobacco, and £ T. 666 from various sources. The cost of administration was £ T. 119,676, leaving £ T. 2,154,702 net receipts, against £ T. 2,132,728 in 1899 and £ T. 2,097,304 in 1898. The total amount of loans outstanding on June 30, 1899, was £ T. 127,832,553, of which £ T. 76,937,762 were the converted debt of 1881, £ T. 28,364,460 various loans obtained between 1888 and 1894, £ T. 13,953,080 lottery bonds, £ T. 4,783,451 the 5-per-cent. customs loan of 1886, £ T. 848,600 the 4-per-cent. priority bonds of 1893, and £ T. 2,945,200 the 5-per-cent. loan from the Ottoman Bank. Other debts are: £ T. 24,513,000 war indemnity due Russia, £ T. 50,000 of indemnities to Russian subjects, and £ T. 273,494 for the Damascus Railroad.

The Army and Navy.—The army is distributed in 7 *ordus*, or military regions, 6 of which can furnish in time of war 4 army corps each, viz., 1 corps of *nizams* or regular troops, 2 corps of the *redif* or territorial army, and 1 corps of *mustahfiz*, reserves of the territorial army. The *nizam* troops are kept at their full strength in time of peace, excepting some special bodies. The first 5 army corps have each 64 battalions of *redif*,

the 6th has 44. Each army corps consists of 2 divisions of infantry, except the 3d and 4th, which have 3 and 4 respectively; 1 division of cavalry, except the 7th; and 3 brigades of artillery, of 2 regiments of 2 sections, each section consisting of 3 batteries, and 1 section of horse artillery, excepting the 6th, which has 1 regiment with 17 batteries, and the 7th, which has 1 regiment with 7 batteries. In Arabia, 1 division of 17 battalions, 2 squadrons, and 2 mountain batteries, and in Tripoli 1 division of 17 battalions, 1 brigade of cavalry, and 3 regiments of artillery, are maintained, which are outside of the army corps. The strength of the standing army in 1900 was about 350,000 men; of the territorial army, 364,000 men; of the *mustahfiz*, 120,000 men; of the general levy, 666,000 men; total war strength, 1,500,000 men, half of whom have received a thorough military training.

The naval force in 1900 consisted of 3 casemated ironclads, 2 turret ships, 2 old broadside ships, 9 old ironclad gunboats, 2 river gunboats, 2 destroyers, and 15 first-class and 7 second-class torpedo craft, with 2 unarmored cruisers, 6 corvettes, 10 gunboats, 3 yachts, and 3 avisos. There were building 1 armored cruiser, 1 destroyer, 2 torpedo boats, 6 cruisers, and 6 first-class gunboats. The navy was manned by 2 admirals, 9 vice-admirals, 16 rear-admirals, 130 captains, 70 commanders, 300 lieutenants, 250 lieutenant commanders, 200 ensigns, 480 mechanics, 50 surgeons, 212 commissary officers and paymasters, about 3,000 petty officers and sailors, and 9,650 marines.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in 1899 was 2,796 miles, of which 1,240 miles were in Europe, comprising the Oriental railroads joining the European system, 786 miles, and the lines from Salonika to Monastir, 137 miles, and from Salonika to Constantinople, 317 miles. In Asiatic Turkey there were 1,556 miles, the Anatolian Railroad having a length of 634 miles, the Aidin line 320 miles, the railroad from Smyrna to Cassaba 321 miles, that from Beyrut to Damascus 96 miles, from Damascus to Nazrib 64 miles, from Jaffa to Jerusalem 54 miles, Mersina to Adana 42 miles, and Fondania to Brussa 25 miles. A line from Acre to Damascus, 157 miles, was not completed. The German company that built the Anatolian Railroad has contracted to build a line from Konieh to Bagdad and Basra before 1908.

The postal traffic in 1895 was 10,366,000 internal, 2,512,000 international, and 1,848,000 transit letters, 225,000 postal cards, and 1,941,000 internal, 1,183,000 international, and 1,230,000 transit newspapers and circulars. The receipts were 5,724,041 francs, and expenses 1,839,565 francs. The length of telegraph lines is 21,800 miles, with 33,760 miles of wire. The number of messages in 1895 was 3,124,168.

Commerce and Production.—The total value of imports in 1898 was estimated at £ T. 24,070,000; exports, £ T. 13,750,000. The value of imports in the financial year 1897 was £ T. 21,350,710, and of exports £ T. 15,428,460. The imports of cloth in 1896 were £ T. 1,510,000 in value: sugar, £ T. 1,400,000; grain and flour, £ T. 1,370,000; quilting, £ T. 1,116,000; yarns, £ T. 1,013,000; coffee, £ T. 933,000; hides and leather, £ T. 568,000; animals, £ T. 544,000; petroleum, £ T. 512,000; madapolam, £ T. 471,000; cashmere, £ T. 401,000; iron manufactures, £ T. 393,000; timber, £ T. 375,000; drugs and colors, £ T. 352,000; butter and cheese, £ T. 284,000; paper, £ T. 274,000; coal, £ T. 270,000; silks, £ T. 252,000; clothing, £ T. 258,000; glass, £ T. 227,000; wool and cotton goods, £ T. 221,000;

carpets, £ T. 215,000. The exports of raisins were £ T. 2,197,000; raw silk and cocoons, £ T. 1,991,000; minerals, £ T. 822,000; mohair, £ T. 767,000; opium, £ T. 752,000; oak galls, £ T. 578,000; cotton, £ T. 563,000; wool, £ T. 540,000; hides and leather, £ T. 498,000; coffee, £ T. 439,000; grain and flour, £ T. 370,000; olive oil, £ T. 349,000; sesame, £ T. 305,000; carpets, £ T. 277,000; drugs and colors, £ T. 262,000; figs, £ T. 251,000; dates, £ T. 233,000; animals, £ T. 220,000; nuts, £ T. 211,000; seeds, £ T. 189,000; oranges and lemons, £ T. 163,000. The imports from and exports to various countries in the financial year 1897 were in value as follow:

COUNTRIES.	Imports.	Exports.
Great Britain.....	£ T. 8,567,740	£ T. 6,318,160
France.....	2,100,640	4,500,050
Austria-Hungary.....	4,202,980	1,486,780
Russia.....	1,752,800	582,770
Italy.....	698,690	469,160
Roumania.....	675,540	230,980
Belgium.....	488,570	229,030
Greece.....	393,020	329,800
Persia.....	681,720	25,030
Egypt.....	649,170
Germany.....	209,140	269,640
Netherlands.....	175,040	374,020
United States.....	24,300	289,220
Tunis.....	22,500	30
Other countries.....	140,170	52,860
Total.....	£ T. 21,369,710	£ T. 15,428,460

Navigation.—The number of vessels entered and cleared at Turkish ports in 1898 was 173,739, of 34,653,457 tons, of which 39,080 were steamers, of 32,446,320 tons, and 134,059 were sailing vessels, of 2,207,137 tons. The merchant navy in 1900 comprised 177 steamers, of 55,983 tons, and 2,205 sailing vessels, of 141,055 tons.

Foreign Relations.—On March 5, 1900, an *trade* announced an increase in the customs duties from 8 to 11 per cent. ad valorem. The powers at once lodged a protest declaring that no such change could be made without a previous understanding with all the powers concerned. The reply made by the Porte was a circular note simply stating that the increase of duty would take effect on May 14. On March 27 the ambassadors presented another collective note reiterating with emphasis their previous declaration that the customs duties are unalterable except with the consent of the powers. To this the Porte replied on April 5 in a note defending the proposed increase upon the grounds of the long delay in concluding the new commercial treaties and the extreme financial pressure from which the treasury was suffering. It described the new tariff as simply provisional in character, and pointed out that the duties imposed were lighter than those which the commercial treaties that were being negotiated sanctioned. In these circumstances the hope was expressed that the powers would not insist on their objections. The ambassadors on April 7, while maintaining their previous declarations, invited the Porte to formulate proposals to be forwarded to their respective governments. The Porte answered by a circular intimating an intention to adhere to its resolution to raise the ad valorem duties to 11 per cent. on May 14. The ambassadors thereupon warned the Porte in a collective note that it alone would have to assume responsibility for the serious consequences that must follow from the action it proposed to take. On June 20 the Porte requested a reply to its proposals, having refrained from putting its decree into execution.

The United States minister, after the Sultan had made three distinct promises to pay the in-

demnity long overdue on account of the destruction of missionary property during the Armenian disturbances, made an urgent demand for satisfaction in April. On June 23 an immediate reply to the demand of the United States Government was requested. After further correspondence the Sultan renewed his personal promise to pay the indemnities claimed, amounting to nearly \$100,000, and evinced his good disposition by ordering the rebuilding of the American college at Harput.

The Russian Government secured an *trade* granting to Russian subjects the exclusive right to build railroads in the districts of Asia Minor fronting on the Black Sea. The Russian ambassador called attention to serious conditions existing in Armenia. A renewal of the oppression of Armenian Christians by officials and of acts of violence on the part of the Kurds led to the resignation of the Armenian Patriarch in March when he could obtain no satisfaction. The difficulty that led to his resignation was in connection with the election of the Catholicos of Sis. His first protest extracted an *trade* ordering the cessation of the difficulties exceptionally created in regard to the Armenians; the preservation of the rights of the patriarchate over all the Armenians in Turkey, including the election of the Catholicos of Sis; and the remission of the military tax arrears in the case of Armenians who have suffered misfortunes, and the granting of facilities for the payment of the tax in future. A note from the Russian ambassador called attention to persecutions in certain districts which drove Armenians to emigrate to Russia, and he informed the Porte of the decision of the Russian Government to insist upon the repatriation of those Armenians having a trade or profession who took refuge in Russian territory at the time of the great Armenian exodus, their number being estimated at 2,000. In July some of the inhabitants of the Armenian village of Spaghank, in the Sassun district, were massacred and in adjacent villages persons were killed. The French vice-consul at Van, and shortly afterward the English vice-consul also, were attacked by Kurdish robbers. The Military Governor of Bitlis was dismissed, and in response to representations of the powers the Sultan ordered a commission to investigate the Spaghank affair.

In February the Sultan ordered a clause to be added to the mining law restricting or prohibiting the acquisition by foreigners of further interests in Turkish mines. To this the ambassadors collectively objected, declaring that it contravened existing treaties. In July a project of law was approved reserving to the Crown an option on all

newly discovered mines and prohibiting concessions until that option is declared. Difficulties that arose over the conclusion of a consular convention with Greece the Greek Government proposed to refer to the ambassadors for arbitration, appealing to the stipulations of the treaty of peace between Greece and Turkey. In negotiating new commercial treaties the Porte desired to secure the right for Ottoman subjects to enjoy the same treatment abroad that is obtained for the subjects of other powers in Turkey. To this both France and Russia objected, basing their contention on the capitulations, and hence negotiations with those powers were interrupted in July. The period of two years assigned to the conclusion of a treaty of commerce with Greece expired on Jan. 14, 1900, and the provisional state of affairs was prolonged for six months. When that period expired the Porte imposed differential tariffs on imports from Greece and also from Roumania, Servia, Montenegro, and Bulgaria, raising the duties on certain articles 30 or 40 per cent. The object of these prohibitory provisional rates was to force the Balkan countries to conclude new commercial rates favorable to Turkey. The Greek Government appealed to the three protecting powers, calling attention to an article in the London protocol of Feb. 3, 1830, which assures to Greek and Turkish subjects reciprocally the commercial rights accorded by either nation to the subjects of other powers. The Balkan states also protested, but could not lay claim to rights under the capitulations. Greece and Roumania refused to open negotiations for commercial treaties unless the differential tariff was repealed. A commercial treaty with Germany was already concluded before the beginning of 1900. This and the other new treaties that were under consideration substituted specific for ad valorem duties, and were calculated to yield an increase of £ T. 750,000 in the customs revenue.

The financial embarrassments of the Government led to the imposition of a supplementary tax of 6 per cent. on the Mohammedan peasantry, which the arbitrary methods of the farmers of the revenue made unendurable in some of the most productive provinces of the empire. The discontent of the farming population drew forth suggestions and demands for thoroughgoing reforms, not from the Young Turkish party alone, but from officials in the diplomatic and civil service. Mohammedan peasants were leaving their lands uncultivated, cutting down their vines and trees, and even emigrating in great numbers beyond the sea. Of 100,000 Syrian emigrants to the United States, fully a third were Mussulmans.

U

UNITARIANS. The annual report of the American Unitarian Association for 1900 gives the number of churches of this denomination as 457, while in 1850 it was 251. The average increase in the number of churches in fifty years had therefore been about 4 a year, or the total increase in fifty years nearly 90 per cent. Fifty-two churches that were on the list in 1850, or one fifth of the whole number, had disappeared from it in 1900.

The association had \$631,936 of property and more than \$400,000 of invested funds, yielding an income of \$16,915. It had, further, a Church Building Loan fund of \$148,821. Eighty-three churches were on the beneficiary list, receiving \$30,004 in all, or an average of more than \$360 each. For the home mission purposes of the as-

sociation \$11,602 were required, and for the foreign missions \$4,950.

American Unitarian Association.—The seventy-fifth annual meeting of the American Unitarian Association was held in Boston, Mass., May 22. President Samuel Eliot, of Harvard University, Cambridge, Mass., was chosen president. The report of the secretary showed that the number of churches contributing to the association had risen from 319 to 343, and the number of delegate societies from 233 to 304. The gifts of churches and individuals for current expenses had aggregated \$75,329, against \$57,513 in the previous year, and the gifts and bequests for capital account had amounted to \$59,552, against \$39,592 in 1899. The development of new sources of income, such as Sunday schools and Young People's Unions, had

added to the contributions. In the publication department, activity of the post office mission was mentioned; the free tract list contained 195 tracts, of which nearly 300,000 copies had been circulated during the year; a new, tenth series, to comprise sermons of earlier leaders of the Unitarian movement, had been inaugurated with the aid of the income of the Edward Wigglesworth fund; free copies of various publications had been furnished to ministers, divinity students, colleges, libraries, and reading rooms; the issuing of books and tracts in foreign languages was contemplated, and other means of extending the work of the publication department were considered. The Japanese mission had drawn to its allegiance a number of native leaders of power and repute, and was regarded as one of the most prophetic forces in Japanese life. Its cost had been largely reduced during the past six years—from \$10,021 in 1894 to \$4,300 in 1899; and during the present year it had been transferred to native control. A steady advance in activity and efficiency had marked the work of the home mission department. The restoration of the system of superintendents had been made possible by increased income, and four field officers were engaged in service. The foundation of the Hackley School, at Tarrytown, N. Y., was mentioned as one of the most important new enterprises of the year. It started with \$150,000 of real estate and funds, given by Mrs. C. B. Hackley, to which Mrs. Goodhue, of New York, had added \$40,000 for the Goodhue Memorial Building.

A joint meeting of committees of the association and of the Universalist General Convention had been held Jan. 22, to consider the subject of closer co-operation. Premising, as it declared, that no disturbance of the separate organic autonomy of the two denominations was desired or expected, and that co-operation, not consolidation; unity, not union, were sought, the meeting decided upon the constitution of a permanent conference committee of five representatives from each body, the members of the committee to be appointed for two years. It was made the duty of this committee to consider cases in which the two denominations are jointly interested, such as opportunities of instituting churches or missions in new fields, circulation of tracts (literature), or other endeavors to promote matters of common agreement; and to consider all cases of conflict of interest, duplication of missionary efforts, or other occasions of friction between the representatives of the two bodies, and recommend appropriate action to the church, conference, or missionary board having jurisdiction in the case. The conference recommended that whenever local conditions permit, the ministers and the churches of the two denominations hold occasional joint meetings for the purpose of aggressively and positively urging upon the people the principles of Christian faith and life. In order to put this plan into immediate operation, the directors of the American Unitarian Association and the trustees of the Universalist General Convention were requested to authorize the members of the conference committee to discharge the functions described in the plan of co-operation until such time as their successors should be appointed. On the presentation of this report of the conference committee in its meeting the association approved and adopted the recommendations contained in it, voted a message of greeting to the Universalist General Convention, and requested the Unitarian representatives on the committee to discharge the duties imposed in it for the term of one year. The resolutions on church membership adopted by the last national conference were

recommended to the churches and the people, and a committee was appointed to collect and codify the church covenants and statements of faith now in use, "to the end, first, that any church may be assisted in forming some basis of membership for its followers; and, second, that some wise system of presenting and teaching our faith to the young may be devised." Representatives of Hungarian, English, German, French, Indian, Japanese, and Icelandic Unitarians addressed the meeting.

Sunday-school Society.—The seventy-third anniversary meeting of the Unitarian Sunday-school Society was held in Boston, Mass., May 24.

The report of the Unitarian Temperance Society, made to the annual meeting in Boston, May 21, dealt largely with the circulation of tracts. The accounts of the society showed a balance on hand of \$660, besides the Richard Clap Weis fund of \$1,000 with accrued interest.

British Triennial Conferences.—The seventh Triennial Conference of members of "Unitarian, Liberal Christian, Free Christian, Presbyterian, and other nonsubscribing or kindred congregations" of England was opened at Leicester, March 29. Mr. W. Blake Odgers, Q. C., of Winchester, presided, and spoke in his opening address in memory of the Rev. Dr. James Martineau, deceased. A resolution commemorative of Dr. Martineau was also unanimously carried at the business meeting of the Conference, and an address concerning him was made by the Rev. Stopford A. Brooke. The meetings were chiefly devoted to the discussion of various topics bearing upon the objects of the Conference, presented in papers on How Best to Organize the Religious Life of our Young People, by Mr. H. P. Greg; The Future Supply of our Ministers, by Mr. A. H. Worthington; The Fear of God and the Sense of Sin, by the Rev. P. H. Wicksteed; and Gospel Interpretation, by Mrs. Humphry Ward. The reading of these papers was followed by voluntary addresses.

British and Foreign Unitarian Association.—The seventy-sixth annual meeting of the British and Foreign Unitarian Association was held in London, June 5 and 6. Mr. C. W. Jones presided. The income for the year had been £4,825 from subscriptions, interest, and sales of books and pamphlets, and £934 in dividends from the McQuaker fund, of which £2,494 had been granted for home and £292 for foreign missions, and about one fifth of the amount had been spent upon publications, about 20,000 copies of which had been granted. Some large bequests had been received, including one of £3,000 (less duty) from the late Mr. Charles Cochrane. The year was represented to have been one of increased activity. The work of the Rev. Stopford A. Brooke as special preacher for the association had quickened religious thought and life in every town visited by him. Among the new features of the propagandist work, movements in New Zealand and Copenhagen, Denmark, were mentioned. The usual grants had been made for work in parts of India, and support of the Brahma Somaj movement was recommended as the best method of aiding the spread of liberal religion among the populations of that country. The McQuaker trustees had offered a scholarship of £100 a year at Manchester College, Oxford, for Scottish graduates willing to take up the Unitarian ministry in Scotland. Meetings of the Sunday-school Association and conferences of Sunday-school delegates and of Postal Mission workers were held in connection with the anniversaries.

Reports to the British Unitarian Association from 285 Sunday schools gave the number of teachers as 3,747, and of pupils as 33,799, of whom 8,321 were upward of sixteen years of age.

UNITED BRETHREN CHURCH. The Church of the United Brethren in Christ returned 243,841 members for 1900, against 202,474 in 1899.

The year's receipts of the Beneficiary Education fund were \$1,884 from the annual conference assessments and \$2,514 from beneficiaries. At the annual meeting of the Board of Education, May 8, all the presidents of the colleges and the president of the seminary of the Church were made a committee to prepare a paper to be presented to the next General Conference, setting forth the needs and demands of the educational work, including the election of a general educational secretary.

Union Biblical Seminary reported 53 students enrolled, with 35 members of the Mission Study Class and 9 members of the Volunteer Student Band. The indebtedness of the institution had been reduced \$7,079 during the year, and \$16,825 since the last General Conference, leaving the present amount \$37,602, upon three fourths of which the rate of interest had been lowered.

The Historical Society took steps at its annual meeting to have a manuscript prepared to be deposited in its collections, containing an account of the events of interest that had occurred in the Church during the past twenty-five years.

The treasurer of the Church Extension Society reported, April 18, that the receipts for the year had exceeded \$23,000, and the expenditure had been about \$15,000, leaving a balance of more than \$8,000 in the treasury. Since the society was organized more than \$13,000 had been collected on outstanding debts from 68 churches, 23 mortgages had been released, and loans amounting to \$125,000 had been made to 110 churches. The amount of new loans for the current year was \$12,350, and more than \$8,000 in new funds had been collected. The Weaver Memorial fund had reached \$4,500, and loans had been made from it to 9 churches.

The receipts of the publishing house for the year ending April 2 from current business were \$204,561; its profits were \$20,012; its net assets on April 1 were \$308,876, showing a gain during the year of \$6,035; and its indebtedness, which was more than \$72,000 in December, 1897, had been reduced to \$13,082. All the periodicals showed increase in circulation.

The Board of Missions met at Lebanon, Pa., April 19, Bishop Kephart presiding. The treasurer reported that the total receipts from all sources had been \$82,992, of which about \$39,000 were classed as "new funds." Adding a balance of \$10,039, which was on hand at the beginning of the year, the total resources of the society had been \$93,031. "Commendable progress" was reported in most of the home missions. The work in Germany consisted of 11 missions, 18 organized churches, 12 missionaries, 988 members, and church property valued at about \$42,000. The mission in Japan, begun in 1895, had 16 meeting places, 118 members, and 8 Sunday schools with 13 teachers and 183 pupils. Thirty-four members had been added during the year. The stations in Africa, which had been nearly destroyed during the outbreaks of the natives, were undergoing reorganization. They returned 12 native workers, services held in 75 towns with an attendance of 45,000 persons, 3 Sunday schools with 204 pupils, and 7 day schools with 320 pupils. The present value of church and meeting-house property was \$9,850. The total annual expenditure of the mission was \$4,597. A new mission was starting in Porto Rico. The interests of the Twentieth Century fund, the amount to be raised for which was fixed at \$50,000, were considered at the meeting. The Woman's Missionary Board had received \$30,665 during the year.

United Brethren Church Old Constitution.—This body consists of those churches and members which refused to acquiesce in certain amendments to the constitution and doctrinal statement of the Church adopted by the General Conference of 1889 (see Annual Cyclopædia for 1889, page 800), claiming that the action of the Conference was illegal and subversive of important testimonies. It returns 26,643 members for 1900, against 22,807 in 1899.

UNITED EVANGELICAL CHURCH. This Church returns for the year ending June 1, 1900, 478 itinerant preachers; 202 local preachers; 60,993 members, showing an increase of 1,250 over the previous year; 5,441 members received by confession of faith (included in the number already given); 1,217 adults and 2,618 infants baptized during the year; 785 Sunday schools, with 11,170 officers and teachers and 76,718 pupils; 420 senior societies of the Keystone League of Christian Endeavor and 29 affiliated societies, with 12,552 active and 2,436 associate members; 120 junior societies, with 2,834 active and 1,397 associate members; 64 auxiliary societies, with 3,643 members; 763 church buildings, valued at \$1,880,140; and 101 parsonages, valued at \$223,907. The amounts of collections for the year were: For missions, \$60,336; for conference claimants, \$3,870; for conference expenses, \$366; for the Sunday School and Tract Union, \$357; for education, \$4,443; for church extension, \$3,106; for salaries of bishops, \$2,842; for the Charitable Society, \$505; and for building and repairing churches and parsonages, \$155,722.

The receipts for the Board of Missions were reported at its annual meeting, held in Harrisburg, Pa., in October, to have been \$27,636, of which \$18,865 were on the account of the general treasury, \$5,724 of the Woman's Missionary Society, and \$3,047 of the Foreign fund. The expenditures had been \$17,217. In addition to these sums the receipts of the annual conferences for missions had been \$35,181, and their expenditures \$43,906, making the totals for the denomination \$62,817 of receipts and \$61,123 of expenditures. Appropriations were made for the coming year of \$57,538. All the arrangements had been made for the establishment of a mission in China, and the designated superintendent of the work, the Rev. C. N. Dubs, was ready to go when the plans were interrupted by the breaking out of the "Boxer" disturbances. The board, deeming it desirable for the superintendent to be on the field ready to avail himself of any opportunities that might offer for entering it, directed Mr. Dubs to proceed with his family to China as soon as possible. (He sailed for China a few weeks afterward.) A twentieth century offering for foreign missions was determined upon, to which each person in the Church was invited to contribute 20 cents.

UNITED STATES OF AMERICA, a federal republic in North America. The legislative power is vested in the Congress, consisting of the Senate and the House of Representatives. There are 90 Senators, 2 from each State, elected by the State Legislatures for six years, one third being renewed every two years. The House of Representatives has 357 members on the basis of the census of 1890, elected by the ballots of all the qualified voters of the several States, which are subdivided into congressional districts containing each approximately 173,000 inhabitants. The executive power is vested in the President, who is commander in chief of the military and naval forces, has a power of veto over acts of Congress, which can be overcome by a vote of two thirds of each house, and is empowered to make treaties, subject

to the ratifying vote of the Senate. The Vice-President is President of the Senate, and in case of the death, resignation, or removal of the President he succeeds the latter for the remainder of the term. In case of the death or disability of both President and Vice-President, the Secretary of State becomes acting President, and after him other members of the Cabinet in their order. The Senate, sitting as a high court, can remove the President or members of the Cabinet on articles of impeachment presented by the House of Representatives. The members of the Cabinet, who are the heads of the eight administrative departments, are appointed by the President, as well as all other executive officers, but his appointments must be confirmed by the Senate. The President and Vice-President are chosen by a college of electors, who are chosen in each State in the manner that the Legislature prescribes, which is in every State by popular suffrage, their number being equal to the sum of the Senators and Representatives of the State. It is the custom of political parties to nominate in national convention their candidates for the presidency and vice-presidency, and the electors, who are chosen by each State on a collective ticket, are accustomed to vote solidly for the candidates designated by their parties beforehand. Thus the election of the President and Vice-President has come to be in fact, though not in form, by the direct vote of the nation. The term of the presidency is four years, and elections are held on the Tuesday following the first Monday in November of every leap year. The President-elect is sworn into office by the Chief Justice on March 4 of the year after his election. The President for the term ending March 4, 1901, was William McKinley, of Ohio, and the Vice-President was Garret A. Hobart, of New Jersey. The Cabinet at the beginning of 1900 was composed as follows: Secretary of State, John Hay, of the District of Columbia; Secretary of the Treasury, Lyman J. Gage, of Illinois; Secretary of War, Elihu Root, of New York; Secretary of the Navy, John Davis Long, of Massachusetts; Postmaster-General, C. Emory Smith, of Pennsylvania; Secretary of the Interior, Ethan Allen Hitchcock, of Missouri; Secretary of Agriculture, James Wilson, of Iowa; Attorney-General, John William Griggs, of New Jersey.

Area and Population.—The area of the States and Territories and their population according to the census of 1900 are given in the table above.

Excluding the Indians of the Indian Territory, the population is 75,965,397. The population of Hawaii is 154,001, making the total for the States and Territories 76,304,799, not including Porto Rico, Tutuila, Guam, and the Philippine and Sulu Islands, which have an aggregate area of about 120,000 square miles and 10,000,000 population. Counting only the land surface, and not inclosed waters, the area of the States and Territories, exclusive of Alaska and transmarine possessions, is 2,970,038 square miles. Rhode Island has 394.98 inhabitants to the square mile; Massachusetts, 348.92; New Jersey, 252.67; Connecticut, 187.48; New York, 152.63; Pennsylvania, 140.09; Maryland, 120.69; Ohio, 102; Delaware, 94.25; Illinois, 86.10; Indiana, 70.08; Kentucky, 53.68; Tennessee, 48.40; Virginia, 46.21; New Hampshire, 45.71; Missouri, 45.20; South Carolina, 44.43; Michigan, 42.16; Iowa, 40.23; North Carolina, 38.98; West Virginia, 38.90; Wisconsin, 38; Vermont, 37.62; Georgia, 37.58; Alabama, 35.48; Mississippi, 33.48; Louisiana, 30.42; Arkansas, 24.73; Hawaii, 23.98; Maine, 23.23; Minnesota, 22.11; Kansas, 18; Nebraska, 13.91; Indian Territory, 12.64; Texas, 11.62; Oklahoma, 10.26; Florida, 9.74; California,

Immigration.—The number of immigrants arrived in the United States in 1900 was 448,572, against 311,715 in 1899. The total number of arriving passengers in 1900 was 594,478, of whom 120,477 were United States citizens returning and 25,429 were nonimmigrant aliens. The immigration was 22.58 per cent. of the total increase of population in 1900. The total immigration from 1821 to 1899 was 19,050,328, of whom 7,014,793 were from the British islands, 5,079,362 from Germany, 1,252,051 from Sweden and Norway, 1,049,315 from British America, 957,783 from Italy, 935,885 from Austria-Hungary, 841,828 from European Russia, 403,715 from France, 312,599 from China, 206,380 from Switzerland, 195,662 from Denmark, 132,808 from the Netherlands, 124,261 from the West Indies, 69,111 from Spain and Portugal, 64,323 from Belgium, 55,015 from Asiatic countries other than China, 35,437 from minor European countries, 33,542 from Australia and Polynesia, 27,544 from Mexico, 14,144 from South America, 2,909 from Central America, and 1,869 from Africa. Of the immigrants who arrived in 1899, Italy sent 77,419, Austria-Hungary 62,491, Russia 60,982, Great Britain and Ireland 45,181, Sweden and Norway 19,502, Denmark 2,690, Spain

and Portugal 2,439, France 1,604, Switzerland 1,326, Netherlands 1,029, Belgium 1,101, the rest of Europe 4,019, China 1,660, the rest of Asia 7,312, the West Indies 2,585, British America 1,322, Mexico 161, Central America 159, South America 89, Africa 51, and other countries 1,027. Of the immigrants in 1900, 114,847 came from Austria-Hungary, 1,196 from Belgium, 2,926 from Denmark, 1,739 from France, 18,507 from Germany, 3,771 from Greece, 100,135 from Italy, 1,735 from the Netherlands, 9,515 from Norway, 4,234 from Portugal, 6,459 from Roumania, 90,787 from Russia, 355 from Spain, 18,650 from Sweden, 1,152 from Switzerland, 235 from European Turkey, 48,237 from the United Kingdom (of whom 9,951 were from England, 35,730 from Ireland, 1,792 from Scotland, 764 from Wales, and 110 not specified), 396 from British America, 237 from Mexico, 42 from Central America, 4,656 from the West Indies, 124 from South America, 1,247 from China, 16,699 from other parts of Asia, 30 from Africa, and 441 from all other countries.

Education.—The estimated number of children in the United States between the ages of five and eighteen was 21,572,114 in 1898. The number of enrolled pupils in the public schools was 15,103,874; the average attendance, 10,356,458; average duration of school, 143 days. There were 410,813 teachers—132,257 men and 278,556 women—receiving in salaries the aggregate sum of \$124,192,270 out of a total expenditure of \$194,292,911 on the public schools of all the States and Territories. In 1899 the total population of school age was estimated at 21,830,774; enrollment of public schools, 15,138,715; average attendance, 10,389,407; average duration of school, 143.2 days; number of teachers, 415,660, comprising 131,793 male and 283,867 female teachers; salaries of superintendents and teachers, \$128,662,880; total expenditure, \$197,281,603. The number of public high schools in 1899 was 5,495, with 9,239 male and 9,479 female teachers and 197,127 male and 279,100 female pupils. The number of private secondary schools was 1,957, with 3,940 male and 5,470 female teachers and 51,900 male and 51,938 female teachers. The number of public normal schools was 166, with 839 male and 1,218 female teachers and 11,543 male and 33,265 female pupils; and the number of private normal schools was 165, with 633 male and 403 female teachers and 11,829 male and 11,743 female pupils. The number of universities and colleges, both coeducational and for men only, was 484, with 8,209 male and 1,679 female professors and instructors and 31,156 male and 15,071 female preparatory, 54,760 male and 17,757 female collegiate, and 3,707 male and 1,191 female graduate students. The total income of these institutions was \$20,242,039. The number of colleges and seminaries for women which confer degrees was 145, with 673 male and 1,768 female professors and instructors and 5,089 preparatory, 14,985 collegiate, and 474 graduate students; total income, \$3,236,416. The number of schools of technicology and schools conferring the degree of bachelor of science was 43, with 1,116 male and 100 female professors and instructors and 2,357 male and 732 female preparatory, 8,858 male and 1,279 female collegiate, and 180 male and 60 female graduate students. The number of theological seminaries was 163, with 906 instructors and 8,261 students; number of law schools, 96, with 966 instructors and 11,874 students; number of medical colleges, 151, with 4,389 instructors and 23,778 students.

The Army.—The strength of the regular army as provided in the army reorganization bill approved on March 2, 1899, is 2,587 officers and 65,000 enlisted men, of whom 581 officers and 2,093

men are attached to the general staff, 1,177 officers and 34,450 men compose 25 regiments of infantry, 472 officers and 12,340 men 10 regiments of cavalry, 357 officers and 11,970 men 7 regiments of artillery, 752 men are in 5 companies of engineers, 720 men in the signal corps, 2,600 in the hospital corps, and 75 are Indian scouts. Each infantry regiment contains 3 battalions of 4 companies. The weapon is the Krag-Jørgensen magazine rifle of 30 caliber. The cavalry regiment consists of 3 sections of 4 troops of 100 men each. The cavalymen are armed with the saber, the Krag-Jørgensen carbine of 30 caliber, and the Colt revolver of 38 caliber. There are 2 infantry and 2 cavalry regiments composed of negroes with white officers. The artillery consists of 84 foot and 14 mounted batteries of 6 pieces, the guns having the caliber of 3.2 inches. The regular army is recruited by voluntary enlistment for three years. All citizens capable of bearing arms are liable to be called to arms in war time, between the ages of eighteen and forty-five. The organized militia, which is required to drill once or twice a week, especially in winter, numbered 7,521 officers and 98,818 men in 1899. There were 328 cavalry officers and 4,155 men, 391 artillery officers and 5,068 men, 5,918 infantry officers and 87,894 men, and 884 other officers and 1,701 men. The male population available for the defense of the country is estimated at 10,149,184. The regular army officers are 1 lieutenant general, 6 major generals, 16 brigadier generals, 77 colonels, 98 lieutenant colonels, 271 majors, 813 captains, 777 first lieutenants, and 532 second lieutenants. The President was authorized in 1899 to raise a volunteer force of 35,000 men organized in 27 infantry and 3 cavalry regiments. There were 24 regiments of infantry enlisted for service in the Philippines, having a strength of 1,200 officers and 31,416 men, and 1 regiment of cavalry consisting of 50 officers and 1,234 men. A regiment of natives of Porto Rico has 31 officers and 400 men. Native troops have been raised in the Philippines, including a squadron of cavalry. The Hawaiian regiment has 407 men. The strength of the regular army at the end of 1899 was 405 cavalry officers and 12,083 men, 322 artillery officers and 10,978 men, 1,078 infantry officers and 35,428 men, and 497 officers in the general staff, signal corps, hospital and ambulance corps, naval brigade, cadet corps, etc., and 9,732 men; total, 2,302 officers and 68,221 enlisted men. At the end of 1900 the total strength of the United States military forces was 103,150 men, 2,534 officers and 68,221 enlisted men in the regular establishment, and 1,548 officers and 31,079 enlisted men of the volunteer service. Under the act of March 2, 1899, the volunteer force was to be discharged and the regular army reduced to 2,447 officers and 29,025 enlisted men by June 30, 1901. The garrison in Porto Rico was reduced before the close of 1900 to 1,636 men, including 879 native troops. In Cuba there were nearly 6,000 troops, and in the Philippines nearly 60,000 men. Secretary Root proposed to recruit a force not to exceed 12,000 men among the natives of the Philippine Islands, to be organized and commanded by officers of the regular army, some of the lieutenantancies to be given to such natives as show fitness for command. A regiment of Porto Ricans also is authorized. The Secretary of War and Lieut.-Gen. Miles both recommended a permanent army of 100,000 men. An artillery corps is to be organized, divided into coast artillery and field artillery.

The Navy.—The battle ships Oregon, Massachusetts, and Indiana, launched in 1893, of 10,298 tons, are protected above and below the water line for over half their length by a belt of 18-inch

armor, and by an armored deck and armored re-doubts in front of the machinery, and the 4 13-inch 35-caliber guns in the fore and aft turrets and 8 8-inch guns in 4 other turrets are protected by inclined armor. These vessels were designed to make over 16 knots, and the Iowa, of 11,410 tons, launched in 1896, carrying 12-inch guns, to go 17 knots. In the Kearsarge and Kentucky, of 11,525 tons, the armor belts are 16½ inches thick, the great guns are of 13-inch bore, and on their turrets are superposed the turrets for the 4 8-inch guns. The Alabama, Illinois, and Wisconsin differ from these in having no 8-inch guns, but 14 6-inch instead of the 5-inch guns carried by the others, besides the 20 quick-firing 6-pounders, which all these turret ships have. The Maine, Missouri, and Ohio have a displacement of 12,500 tons, with armor 12 inches thick and 12-inch guns, engines of 16,000 horse power instead of 10,000, since large coal endurance and a speed of 18 knots are the objects sought. The Georgia, New Jersey, and Pennsylvania will displace 13,500 tons, will have for the main armament 4 12-inch and 16 6-inch guns, and will be able with 16,000 horse power to make at least 18 knots. The newer armored cruisers, like the battle ships, are larger than their predecessors, as in other navies. In the armored cruiser Texas, displacing 6,315 tons, 2 12-inch guns are mounted singly in turrets protected by an oblique redoubt, and there are 6 6-inch and 12 quick-firing 6-pounders; and in spite of her heavy armament and armor plates 12 inches thick the vessel, which was launched in 1892, can make nearly 18 knots. The cruiser New York, launched in 1891, having a displacement of 8,200 tons, engines of 17,500 horse power, giving a speed of 21 knots, and in addition to 10-inch side plating a strong curved steel deck, carries 8-inch guns in pairs in the fore and aft turrets and 1 on each beam, with a secondary armament of 12 4-inch and 8 other quick firers. The Brooklyn, launched in 1895, displaces 9,215 tons, having 15-inch plates and an armament of 8-inch guns disposed as in the New York, and 12 5-inch and 12 smaller quick firers, and could make nearly 22 knots with engines of 17,300 horse power. The California, Nebraska, and West Virginia displace 12,000 tons, carry 14 quick-firing 8-inch guns and 14 6-inch and 20 smaller ones, and are designed to make 22 knots an hour. All the new cruisers are sheathed and coppered. The second-class protected cruisers of 3,100 tons—the Chattanooga, Cleveland, Denver, Des Moines, Galveston, and Tacoma—to be armed with 10 5-inch quick firers, are smaller than the Albany and New Orleans, launched in 1899 and 1896, and even than the Cincinnati and Raleigh, just as these were lighter than the Olympia or the Newark, Philadelphia or San Francisco, and the latest vessels are not intended to make over 16.5 knots. The newest type of monitor, the Arkansas, Connecticut, Florida, and Wyoming, of 3,235 tons, have 11-inch armor, 2 12-inch guns, 4 4-inch and 3 more quick firers, and a speed of 12 knots. The fastest vessels in the navy are the unarmored cruisers Columbia and Minneapolis, built in 1892 and 1893, displacing 7,375 tons, and carrying 1 8-inch gun and 22 quick firers of various sizes, have triple-expansion engines of 18,500 horse and 20,800 horse power, enabling them to steam 23 and 22 knots respectively. There were at the end of 1899 in the effective navy 9 first-class battle ships, 6 not completed and 1 of the second class; 19 good coast-defense vessels, besides the 4 new monitors; 1 armored ram, Admiral Ammen's Katahdin, which can be submerged excepting the turtle deck and the well-armed funnel and ventilating shafts when she is making an attack; 2 armored cruisers,

and 3 building; 15 protected cruisers, and 6 under construction; 3 commerce destroyers; 17 gunboats, and 1 building; 16 torpedo-boat destroyers under construction; and 24 completed and 13 not yet completed torpedo boats.

Pensions.—The number of pensioners on the rolls in the year ending June 30, 1900, was 993,529, of whom 752,510 were invalids and 241,019 widows and dependents. The disbursements during the year amounted to \$138,462,130, of which \$9,828,525 were first payments and \$128,633,605 other pensions. Under the general pension law the total number of 878,332 claims of invalids and 534,721 of widows, etc., had been filed up to June 30, 1900, and 586,521 claims of invalids and 332,029 of widows, etc., allowed. Under the act of June 27, 1890, there had been 847,327 applications of invalids and 338,488 of widows, etc., filed, and 451,531 claims of invalids and 181,262 of widows, etc., allowed. The new applications during the year were 2,753 for invalids and 7,593 for widows, etc., under the general law, and 10,940 for invalids and 338,488 for widows, etc., under the act of 1890, and the claims allowed were 1,690 for invalids and 3,308 for widows, etc., under the general law, and 21,345 for invalids and 12,173 for widows, etc., under the act of 1890. There were 7 applications of widows of soldiers of the War of 1812, and 1 was allowed, the total number allowed up to date having been 25,713 for survivors and 35,480 for widows; of survivors of the war with Mexico, 69 fled claims and 497 widows, while 21 claims of survivors and 420 of widows were allowed; of survivors of Indian wars, 26 made applications, and 196 widows, and the claims of 10 survivors and 144 widows were allowed. The number of applications arising out of the war with Spain was 12,038 for invalids and 1,383 for widows and dependent relatives, and the number of claims allowed was 801 for invalids and 710 for widows, the total granted in the two years since applications were first filed having been 926 for invalids and 888 for widows, etc., while the total number of applications was 27,047 for invalids and 3,934 for widows, etc. The applications from army nurses were 49 in number; claims allowed, 22.

Public Lands.—The total area of original homestead entries in 1900 was 8,478,409 acres, of which 1,853,090 acres were in North Dakota, 1,226,405 acres in Oklahoma, 477,523 acres in Minnesota, 456,855 acres in Nebraska, 446,518 acres in Arkansas, 439,814 acres in Oregon, 410,040 acres in South Dakota, 405,496 acres in Washington, 328,437 acres in Montana, 312,784 acres in Colorado, 296,398 acres in Idaho, 264,536 acres in California, 251,215 acres in New Mexico, 235,308 acres in Wyoming, 208,277 acres in Louisiana, 140,623 acres in Alabama, 127,563 acres in Florida, 123,604 acres in Mississippi, 119,750 acres in Missouri, 100,173 acres in Wisconsin, 60,160 acres in Utah, and 53,594 acres in Michigan. The railroad selections in 1900 amounted to 1,932,139 acres, of which 507,467 acres were in Wyoming, 347,625 acres in Kansas, 243,201 acres in Washington, 224,913 acres in Colorado, 204,888 acres in Oregon, 171,794 acres in California, 82,738 acres in Montana, 75,344 acres in Utah, and 44,034 acres in Idaho. The number of acres disposed of for cash under the homestead acts and timber culture acts or located with agricultural college and other kinds of scrip or with military bounty land warrants or selected by States or railroads was 13,391,464 acres, of which 1,869,792 acres were in North Dakota, 1,270,403 acres in Oklahoma, 1,157,088 acres in Montana, 995,982 acres in Wyoming, 842,015 acres in Oregon, 781,660 acres in Colorado, 772,034 acres in Washington, 643,082 acres in Minnesota, 576,779 acres in California,

492,017 acres in New Mexico, 466,738 acres in Arkansas, 464,726 acres in Utah, 461,674 acres in Nebraska, 460,976 acres in Idaho, 455,913 acres in South Dakota, 452,166 acres in Kansas, 232,057 acres in Louisiana, 203,881 acres in Missouri, 203,380 acres in Alabama, 149,727 acres in Mississippi, 114,352 acres in Wisconsin, 64,645 acres in Louisiana, 54,700 acres in Arizona, and 49,260 acres in Nevada.

Indians.—The Indian population on reservations in 1900 was 270,544, compared with 243,524 in 1890. There were 86,265 in Indian Territory, 40,189 in Arizona, 19,212 in South Dakota, 13,926 in Oklahoma, 11,431 in California, 10,726 in Wisconsin, 10,076 in Montana, 9,827 in Washington, 8,952 in Minnesota, 8,480 in New Mexico, 8,321 in Nevada, 8,276 in North Dakota, 7,557 in Michigan, 5,334 in New York, 4,063 in Oregon, 3,854 in Nebraska, 2,115 in Utah, 1,642 in Wyoming, 1,436 in North Carolina, 1,211 in Kansas, and 995 in Colorado, 575 in Florida, 385 in Iowa, and 290 in Texas. The births among Indians were 4,196 in 1900, against 4,863 in 1890; deaths, 3,698, against 5,218. The total area of Indian reservations in 1900 was 121,665 square miles, compared with 162,991 square miles in 1890, the Indian Territory having been reduced from 40,411 to 30,489 square miles, the area of Oklahoma from 20,770 to 6,884 square miles, that in South Dakota from 18,221 to 8,991 square miles, that in North Dakota from 9,158 to 5,784 square miles, that in New Mexico from 15,020 to 2,605 square miles, that in Montana from 16,549 to 14,845 square miles, that in Idaho from 3,552 to 2,132 square miles, the reservation of 1,710 square miles in Colorado having been abolished, the Minnesota reservation cut down from 3,523 to 2,447 square miles, the Oregon reservation from 3,242 to 2,031 square miles, and the one in Utah from 6,207 to 3,186 and that in Washington from 6,321 to 3,646 square miles, and in Wyoming from 3,660 to 2,828 square miles, while in Arizona the area has been increased from 10,317 to 23,673 square miles.

Patents.—The number of applications for patents during the year ending Dec. 31, 1900, was 41,980; caveats filed, 1,731; patents and reissues, 26,499; cash received, \$1,350,828; cash expended, \$1,260,019; surplus, \$90,808. The total number of first patents issued from 1852 to 1901 was 664,827; designs patented, 33,813; reissues of patents, 11,879; trade-marks registered, 35,678; labels registered, 8,009. From 1836 till 1852 the number of patents was 9,957. During the calendar year 1900 the issues of patents were 24,660 in number; of design patents, 1,758; reissues, 81; total, 26,499; trade-marks registered, 1,721; labels and prints, 830; total certificates, 2,551.

Commerce and Production.—The production of corn in the United States in the year ending June 30, 1900, was 2,078,143,933 bushels, of which 213,123,412 bushels were exported, or 10.30 per cent. of the crop, while 1,865,020,521 bushels and 2,480 bushels of imported corn, making a total of 1,865,023,001 bushels, were consumed in the United States. The wheat crop for the calendar year 1899 was 547,303,846 bushels, of which 186,096,762 bushels, or 34 per cent., were exported and 361,207,084 bushels were retained for consumption, the total domestic consumption, after adding 320,195 bushels of imports and deducting 297,359 bushels of foreign exports, having been 361,229,920 bushels. The area under corn in the calendar year 1900, according to the reports of the Department of Agriculture, was 83,320,872 acres, producing 2,105,102,516 bushels, having a farm value of \$751,220,034, the value per bushel on Dec. 1 being 35.7 cents, and the yield per acre having been 25.3 bushels,

giving an average return of \$9.02 per acre. The area under wheat was 42,495,385 acres, yielding 522,229,505 bushels, an average of 12.3 bushels per acre, making the crop worth at 62 cents a bushel, the average price on Dec. 1, \$323,525,177, an average of \$7.61 per acre. The area under rye was 1,591,362 acres, producing 23,995,417 bushels, having a value of \$12,295,417 on the farm, or \$7.73 per acre, the price on Dec. 1 having been 51.2 cents, the yield 15.1 bushels per acre. The area sown to oats was 27,364,795 acres, producing 809,125,989 bushels, 29.6 bushels to the acre, worth 25.8 cents a bushel, \$7.63 per acre, and \$208,669,233 for the whole crop. The area under buckwheat was 637,930 acres, yielding 9,566,966 bushels, an average of 15 bushels, worth \$5,341,413 at 55.8 cents a bushel, giving \$8.37 an acre. The barley crop from 2,894,282 acres was 58,925,833 bushels, worth \$24,075,271 at 40.8 cents a bushel, giving \$8.32 an acre for the average yield of 20.4 bushels. Of the total wheat crop, 82,488,655 bushels were raised in Kansas, 51,509,252 bushels in Minnesota, 33,325,897 bushels in Dakota, 28,543,628 bushels in California, 25,096,661 bushels in Washington, 24,801,900 bushels in Nebraska, 21,798,223 bushels in Iowa, 20,281,334 bushels in Pennsylvania, 18,846,713 bushels in Missouri, 18,657,373 bushels in Oklahoma, 17,982,068 bushels in Illinois, 16,198,012 bushels in Oregon, 15,187,848 bushels in Maryland, 13,166,599 bushels in Wisconsin, 12,442,846 bushels in Kentucky, 9,421,932 bushels in Virginia, 9,271,764 bushels in Michigan, 8,523,876 bushels in Ohio, 6,496,166 bushels in New York, 6,411,702 bushels in Indiana, 5,960,803 bushels in North Carolina, 4,452,895 bushels in West Virginia, 2,689,418 bushels in Arkansas, 1,929,963 bushels in Montana, 916,351 bushels in Alabama, and 25,724,492 bushels in other States and Territories. The hay crop in 1900 was 50,110,906 tons, cut from 39,132,890 acres, an average crop of 1.28 ton an acre, worth at the average price of \$8.80 a ton on the farm the total sum of \$445,538,870. Iowa raised 5,006,470 tons of hay, Kansas 4,031,461 tons, New York 3,351,991 tons, Missouri 2,768,015 tons, California 2,708,171 tons, Pennsylvania 2,672,561 tons, Nebraska 2,039,489 tons, Illinois 2,119,419 tons, South Dakota 2,064,196 tons, Colorado 1,783,133 tons, Michigan 1,727,617 tons, Oregon 1,677,085 tons, Indiana 1,663,452 tons, Ohio 1,652,797 tons, Minnesota 1,423,344 tons, Wisconsin 1,218,354 tons, Vermont 1,066,524 tons, Washington 846,491 tons, Maine 843,997 tons, Idaho 659,103 tons, and Montana, Virginia, Massachusetts, West Virginia, Texas, New Hampshire, and Utah each more than 500,000 tons. The area of the potato crop was 2,611,054 acres, yielding 210,926,897 bushels, 80.8 bushels to the acre, worth \$90,811,167, the average price having been 43.1 cents a bushel; New York raised 27,481,356 bushels, Indiana 16,630,941 bushels, Wisconsin 15,619,641 bushels, Illinois 15,296,104 bushels, Missouri 14,004,576 bushels, Michigan 12,561,584 bushels, Pennsylvania 10,921,748 bushels, Missouri 10,106,961 bushels, and Nebraska, Indiana, Iowa, Kansas, and Maine over 6,000,000 bushels each. The tobacco crop of the United States in 1896 was 403,004,320 pounds, grown on 594,749 acres, and its value was \$24,258,070. Alabama produced 1,005,313 bales of cotton on 2,883,049 acres in 1899, the value of the crop being \$35,852,176; Arkansas on 1,726,350 acres raised 669,385 bales, worth \$24,298,676; Florida, 41,855 bales, worth \$2,189,805, on 149,403 acres; Georgia, 1,345,699 bales on 3,287,741 acres, value \$48,024,822; Louisiana, 699,476 bales, valued at \$25,670,000, on 1,179,156 acres; Mississippi, 1,203,739 bales, valued at \$44,175,897, on 2,784,286 acres; North Carolina, 503,825 bales, valued at \$18,145,257, on

1,219,888 acres; South Carolina, 830,714 bales, valued at \$29,377,647, on 2,212,020 acres; Tennessee, 192,263 bales, valued at \$6,950,307, on 734,415 acres; Texas, 2,438,555 bales, valued at \$92,187,133, on 6,642,309 acres; Virginia, 8,007 bales, valued at \$293,669, on 35,302 acres; other States and Territories, 204,007 bales, valued at \$7,682,479, on 549,578 acres; total area planted to cotton, 23,403,497 acres, producing 9,142,838 bales, valued at \$334,847,868. The crop of cotton moved during the year ending Aug. 31, 1900, was 9,436,416 bales, averaging 478 pounds net and 504.12 pounds gross, or 4,757,062.942 pounds, having a farm value estimated at \$357,000,000. The exports of domestic cotton during the year were 3,100,583,188 pounds, 65.18 per cent. of the crop, leaving 1,656,479,754 pounds of domestic cotton for consumption; imports of foreign cotton were 67,398,521 pounds, and exports 1,381,463 pounds, leaving 66,017,058 pounds of foreign cotton retained for consumption and making the total consumption of domestic and foreign cotton 1,722,496,812 pounds. Out of 9,422,000 bales handled during the crop year, 2,343,000 were exported to Great Britain and 3,603,000 to other countries, making the total exports 5,946,000 bales; and 2,047,000 bales were taken by northern and 1,597,000 by southern mills, making the domestic consumption 3,644,000 bales, or 39 per cent. of the commercial crop. The wool produced in the United States during the year ending June 30, 1900, amounted to 288,636,621 pounds, of which 2,200,309 pounds were exported and 286,436,312 pounds retained for consumption; imports of foreign wool were 155,928,455 pounds, and exports 5,702,251 pounds, leaving for consumption 150,226,204 pounds of foreign wool, 34.4 per cent. of the total consumption, which amounted to 436,662,516 pounds. The number of sheep in the country on April 1, 1900, was 40,267,818, of which 3,786,688 were in New Mexico, 3,717,160 in Montana, 2,780,546 in Wyoming, 2,754,499 in Ohio, 2,576,240 in Idaho, 2,351,274 in Oregon, 2,317,636 in Texas, 2,261,917 in Utah, 2,128,508 in Colorado, 1,907,430 in California, 1,340,456 in Michigan, 1,103,942 in Arizona, 819,088 in New York, 777,677 in Pennsylvania, 759,399 in Washington, 726,040 in Wisconsin, and more than 500,000 each in Indiana, Illinois, Nevada, Iowa, Missouri, and Kentucky. The total product of washed and unwashed wool in 1900 was estimated at 259,972,815 pounds, or, including 28,663,806 pounds of pulled wool, at 288,636,621 pounds, the average weight of fleece being 6.46 pounds, the shrinkage 61.1 per cent., the product of scoured wool 101,024,837, or, including 17,198,283 pounds of pulled wool, 118,223,120 pounds.

The number of horses in the country on Jan. 1, 1900, as reported by the Department of Agriculture, was 13,537,524, valued at \$603,969,442; mules, 2,086,027, value \$111,717,092; milch cows, 16,292,360, value \$514,812,106; oxen and other cattle, 27,610,054, value \$689,486,260; sheep, 41,883,065, value \$122,665,913. The total value of farm animals was \$2,042,650,813, exclusive of swine, of which there were 38,651,631 in 1899, valued at \$170,109,743.

The production of cane sugar in 1900 was estimated at 334,594,450 pounds, 329,968,450 pounds in Louisiana and 4,626,000 pounds in other States; of molasses, 18,163,449 gallons, 14,971,313 gallons Louisiana and 4,626,000 pounds in other States; The total production of refined sugar in the calendar year 1900 was 2,219,847 tons, showing a consumption of 65.2 pounds per capita, 1,950,014 tons having been manufactured from imported raw sugar, 7,647 tons from imported molasses, and 174,450 tons from domestic cane sugar; 82,736 tons

were domestic beet sugar, and about 5,000 tons were maple sugar. The production of sugar from beet roots in the United States was 62,826 tons in 1898, 34,453 tons in 1897, 39,684 tons in 1896, 20,443 tons in 1894, and previous to that the industry was in the experimental stage. The consumption of distilled spirits in the United States during the fiscal year 1900 was 97,248,382 proof gallons, according to the reports of the Commissioner of Internal Revenue, being 1.27 gallon per capita, consisting of 1,386,361 gallons of domestic spirits distilled from fruit, 94,156,023 gallons from grain, etc., and 1,705,998 gallons of imported spirits. The consumption of wines was 30,427,491 gallons, 0.4 gallon per capita, 26,492,401 gallons being of domestic production and 3,935,000 gallons imported. The consumption of malt liquors was 1,221,500,160 gallons, 16.01 gallons per capita, 1,218,183,252 gallons having been brewed in the United States and 3,316,908 gallons imported for consumption. The production of oleomargarine in the fiscal year 1900 was 104,263,651 pounds, paying \$2,085,273 in internal revenue taxes.

The production of petroleum during the calendar year 1899 was 2,396,975,700 gallons, and 17,540 gallons were imported, making a total of 2,396,993,240 gallons. The exports were 133,023,656 gallons in the crude state and 948,720,575 gallons manufactured into illuminating oil, making a total of 1,081,744,231 gallons, which left 1,315,249,009 gallons for domestic consumption, the export being 45.13 per cent. of the total product. The production of bituminous coal in the calendar year 1898 was 172,608,917 tons, and the imports were 1,251,512 tons, giving a total supply of 173,860,429 tons, of which 170,379,977 tons remained for consumption after the exportation of 3,480,452 tons, or 2.02 per cent. of the domestic product. The production has increased 70 per cent. in ten years and the percentage exported has doubled. The quantity of bituminous coal marketed in 1899 was estimated by the United States Geological Survey at 138,564,925 tons, valued at \$135,017,663; the quantity of anthracite coal at 47,823,241 tons, valued at \$86,081,834; total, 186,388,166 tons, valued at \$221,099,497. The total production of anthracite and bituminous coal was estimated at 226,553,564 tons. The total output for the calendar year 1899 of bituminous coal was reported by the Geological Survey as 193,321,987 short tons; Pennsylvania anthracite, 53,944,647 long tons; value of stone, \$44,736,576; petroleum, 57,070,650 barrels, valued at \$64,603,904; value of natural gas, \$20,024,873; pig iron produced, 13,620,703 long tons, value \$245,172,654; silver, 54,704,500 ounces, of the coining value of \$70,806,626 and the commercial value of \$32,858,700; gold, 3,437,210 ounces, of the value of \$71,053,400; copper, 585,342,124 pounds, value at New York \$104,190,898; lead, 209,240 short tons, value at New York \$18,831,600; zinc, 119,408 short tons, value at New York \$13,731,920; quicksilver, 30,454 flasks of 76½ pounds, value at San Francisco \$1,452,745; aluminum, 5,200,000 pounds, value at Pittsburg \$1,716,000; antimony, 1,275 short tons, value at San Francisco \$251,875; nickel, 22,541 pounds, value \$8,566; platinum, 300 ounces, value \$1,800. The estimated value of brick clay produced was \$11,250,000, and of other clay \$1,250,000. Of cement, 14,311,407 barrels were produced, valued at \$14,417,058. The number of gallons of mineral waters sold was 39,562,136, valued at \$6,948,030. Of phosphate rock, 1,515,702 long tons were dug, value \$5,084,076. The production of salt was 18,356,503 barrels, and its value \$7,509,184. Of limestone for iron flux, 6,707,435 long tons were produced, value \$4,695,205; of gypsum, 479,235 short tons, value \$1,287,080; of fibrous talc,

54,655 short tons, value \$438,150; of pyrite, 174,734 long tons, value \$543,249; of corundum and emery, 4,900 short tons, value \$150,600; of barytes, 41,894 short tons, value \$139,528; of fluorspar, 15,900 short tons, value \$96,650; of feldspar, 27,202 long tons, value \$228,545; of manganese ore, 9,935 long tons, value \$82,278; of flint, 37,852 long tons, value \$231,345; of bauxite, 35,280 long tons, value \$125,598; of zinc white, 6,707,435 short tons, value \$4,695,205; of asphaltum, 75,085 short tons, value \$553,904; of soapstone, 24,765 short tons, value \$330,805; of mineral paints, 63,111 short tons, value \$728,389; of sulphur, 4,830 short tons, value \$107,500; of fuller's earth, 12,381 short tons, value \$79,644; of marls, 60,000 short tons, value \$30,000; of infusorial earth and tripoli, 4,634 short tons, value \$37,032; of magnesite, 1,280 short tons, value \$18,480; of abrasive garnet, 2,765 short tons, value \$98,325. The value of grindstones was \$675,586; of oilstones, etc., \$208,283; of pumice stone, \$10,000; of millstones, \$28,115. The value of precious stones was \$185,770. The production of borax was 40,714,000 pounds, valued at \$1,139,882; of mica, 108,570 pounds of sheet, worth \$70,587, and 1,505 tons of scrap, worth \$30,878; of graphite, 2,900,732 pounds of crystalline and 2,324 tons of amorphous, worth together \$167,106; of cobalt oxide, 10,230 pounds, value \$18,512; of rutile, 230 pounds, value \$1,030; of bromine, 433,004 pounds, value \$108,251; of asbestos, 681 tons, value \$11,740. The value of nonmetallic products was \$447,790,862; that of metallic products was \$527,218,084, and that of products not specified was estimated at \$1,000,000, giving as the total value of mineral products \$676,008,946.

The number of iron furnaces in blast on Dec. 31, 1900, was 232 out of the total number of 406, of which 153 were in Pennsylvania, 54 in Ohio, 45 in Alabama, 27 in Virginia, 19 in New York, 19 in Tennessee, 17 in Illinois, 12 in New Jersey, 12 in Michigan, 8 in Kentucky, 7 in Maryland, 6 in Wisconsin, 5 in Georgia, 4 each in Connecticut and Texas, 3 in Massachusetts and in West Virginia, 2 in Missouri and in Colorado, and 1 in Minnesota and in Oregon. The total production of pig iron for the calendar year 1900 was 13,789,242 tons of 2,240 pounds. In 1899 the production of pig iron was 13,620,703 tons; of spiegeleisen and ferromanganese, 219,768 tons; of bar, hoop, and structural shapes, 4,996,801 tons; of structural shapes alone, 906,277 tons; of wire rods, 1,099,376 tons; of plate and sheet iron, 1,903,505 tons; of cut nails and spikes, 85,015 tons; of wire nails, 339,264 tons; of rolled iron and steel, including nail plate, 8,084,697 tons; of rolled, including also rails, 10,357,307 tons; of Bessemer steel rails, 2,270,585 tons; of open-hearth steel rails, 523 tons; of iron rails, 1,592 tons; of street rails, 154,246 tons; total rails, 2,272,700 tons; of Bessemer steel ingots and castings, 7,586,354 tons; of open-hearth steel ingots and castings, 2,947,316 tons; of crucible steel, 101,213; of all other ingots and castings, 4,974; total crude steel, 10,639,857 tons; of blooms, 13,074 tons; of tin plates for the year ending June 30, 1900, 397,767 tons. Of the pig iron, 1,677,048 tons were produced with anthracite or mixed anthracite and bituminous coal, 339,874 tons with charcoal, and 11,727,712 tons with bituminous coal and coke. The exports of domestic pig iron in the fiscal year 1900 were 160,690 tons; imports, 61,100 tons; exports of foreign, 157 tons; retained for consumption, 13,520,956 tons, the percentage of foreign iron having decreased from 10.64 per cent. in 1892 to 0.40 per cent. The export of rails was 347,805 tons, and the import 2,487, making the quantity retained for consumption 1,927,382 tons. The imports of

tin plates were 147,963,804 pounds, valued at \$4,799,796, 147,321,985 pounds coming from Great Britain and 641,819 pounds from other countries. The quantity of tin plates manufactured in the United States was 446,982,063 pounds, comprising 355,347,670 pounds of tin and 91,634,393 pounds of terne plates, 446,924,855 pounds being made from American and 57,208 pounds from foreign black plates, whereas in 1893 the quantity manufactured was 99,819,202 pounds, of which 56,219,478 pounds were made from imported black plates.

The volume of foreign commerce in the year ending June 30, 1900, reached \$2,244,424,266, compared with \$1,924,171,791 in 1899, the highest figure attained till then. The excess of merchandise exports over imports in 1900 was \$544,541,898, compared with \$529,874,813 in 1899, and \$615,432,676 in 1898, the excess for the three years amounting to \$1,689,849,387. The total value of merchandise imports in 1900 was \$849,941,184, an amount exceeded only in 1893, when \$866,400,922 worth of merchandise was imported and there was an adverse balance of \$18,737,728. The value of domestic exports in 1900 was \$1,370,763,571, exceeding the total for 1898, the highest till then attained, by \$160,471,658. The value of foreign exports in 1900 was \$23,719,511, making the total value of merchandise exports \$1,394,483,082.

The values of the articles imported in the year ending June 30, 1900, are given in the following table:

	Value.
Agricultural implements.....	\$4,852
Animals:	
Cattle, free.....	202,615
Cattle, dutiable.....	2,055,079
Horses, free.....	357,273
Horses, dutiable.....	230,320
Sheep, free.....	48,324
Sheep, dutiable.....	1,316,702
All other, including fowls, free.....	194,980
All other, dutiable.....	116,658
Antimony ore.....	65,745
Antimony, regulus and metal.....	275,774
Articles, the growth or manufacture of the United States, returned.....	4,504,565
Articles for the use of religious or educational institutions.....	654,546
Art works:	
The production of American artists.....	344,673
All other.....	2,264,216
Asbestos, unmanufactured.....	293,347
Asphaltum.....	409,285
Bark, hemlock.....	86,690
Beads and bead ornaments.....	1,177,670
Beeswax.....	51,526
Beverages:	
Ginger ale.....	249,456
All other.....	100,790
Bismuth.....	225,584
Blacking.....	66,642
Bolting cloths.....	234,644
Bones, horns, and hoofs, unmanufactured.....	890,063
Bone and horn, manufactures of.....	271,863
Books, music, maps, engravings, etc., free.....	2,019,660
Books, etc., dutiable.....	1,551,960
Brass, and manufactures of.....	24,816
Brass, old, free.....	560,186
Breadstuffs:	
Barley.....	91,040
Corn.....	1,942
Oats.....	18,960
Oatmeal.....	13,499
Rye.....	366
Wheat.....	240,496
Wheat flour.....	3,771
All other, free.....	411,029
All other, dutiable.....	1,023,226
Bristles, not sorted or prepared.....	22,330
Bristles, bunched or prepared.....	2,130,537
Brushes.....	977,513
Burr stones.....	21,687
Buttons and button forms.....	592,501
Cement.....	3,270,916
Chalk.....	86,511
Chemicals, drugs, and dyes:	
Alizarin and alizarin colors.....	768,464
Argols, or wine lees.....	2,388,698
Barks, cinchona, etc.....	563,065
Coal-tar colors and dyes.....	4,690,072
Cochineal.....	31,211

Of the total imports, the value of \$367,236,866 was free of duty and \$482,704,318 dutiable.

The total value of animals imported free of duty was \$803,191; of dutiable animals, \$3,727,759. The numbers of animals imported free of duty for the improvement of breeds were 1,045 cattle, 1,284 horses, and 2,427 sheep; of dutiable animals, 179,961 cattle, 1,818 horses, and 379,365 sheep. The quantity of antimony metal or regulus was 3,538,751 pounds, of ore 5,707,112 pounds. Of asphaltum, 136,576 tons were imported.

The import of hemlock bark was 22,580 cords. Of British ginger ale, 337,977 dozen bottles were imported. The quantity of bismuth was 187,681 pounds. The number of pounds of old brass was 4,593,894. Imports of breadstuffs were 189,757

bushels of barley, 2,480 bushels of corn, 41,523 bushels of oats, 234,959 pounds of oatmeal, 330 bushels of rye, 316,968 bushels of wheat, and 717 barrels of flour. Including the various farinaceous food preparations, which made five sixths of the total value, the imports of breadstuffs amounted to \$1,803,729. The quantity of crude bristles was 27,140 pounds, and of sorted and bunched bristles 2,503,018 pounds.

The importation of Portland, Roman, and other hydraulic cement was 2,356,422 barrels; of chalk, 92,615 tons. The imports of chemicals, drugs, and dyes included 5,984,991 pounds of alizarin colors, 27,339,480 pounds of crude tartar and wine lees, 4,107,358 pounds of cinchona or other bark from which quinine is extracted, 157,917 pounds of cochineal, 48,188 tons of logwood, 3,350,768 pounds of logwood extract and decoctions, 27,943,106 pounds of glycerin, 961,366 pounds of gum arabic, 1,789,580 pounds of crude camphor, 2,297,992 pounds of gum chicle, 23,829,342 pounds of copal and similar gums, 38,882,940 pounds of gambier, 10,621,451 pounds of shellac, 2,746,944 pounds of indigo, 106,333,199 pounds of licorice root, 136,403,151 pounds of chloride of lime or bleaching powder, 1,972,349 gallons of mineral waters, 544,938 pounds of crude opium and 142,479 pounds of opium prepared for smoking or containing less than 9 per cent. of morphine, 1,499,752 pounds of chlorate of potash, 115,276,906 pounds of the muriate, 10,332,836 pounds of nitrate or saltpeter, and 54,552,598 pounds of other potassic salts, 3,313,749 ounces of quinia sulphate and other alkaloids and salts of cinchona bark, 11,429,989 pounds of caustic soda, 184,247 tons of nitrate of soda, 6,624,314 pounds of sal soda, 78,571,870 pounds of soda ash, and 23,632,374 pounds of other salts of soda, 155,399 tons of crude sulphur or brimstone, 10,335,980 pounds of ground sumac, and 255,966 pounds of vanilla beans. The value of dyewoods was \$1,083,644; of gums, \$6,884,704; of potash salts, \$3,437,160; of soda salts, \$5,908,611; the total value of chemicals, drugs, and dyes, \$53,705,152, of which \$31,355,759 were free of duty and \$22,349,393 dutiable. The import of raw chicory root was 1,216,518 pounds; of roasted and ground chicory, 384,957 pounds; of chocolate, 1,209,012 pounds. Of chrome ore, or chromate of iron, 21,830 tons were imported; of clays or earths, 138,625 tons. The importation of coal was 156 tons of anthracite, 1,707,076 tons of bituminous, and 56,448 tons of coke. The imports of crude cacao, including leaves and shells, were 41,746,872 pounds; of manufactured cocoa, 1,012,368 pounds. Of this, 39,191,140 pounds were re-exported, making the net imports 748,800,771 pounds, valued at \$48,777,126, the average price being 6.5 cents a pound, showing a consumption per capita of 9.81 pounds. The quantity of coffee imported was 787,991,911 pounds. Of coffee substitute, 1,262,659 pounds were brought in. Copper imports consisted of 36,205 tons of ore and regulus and 84,638,794 pounds of bars, ingots, and plates, and old and other manufactured copper. The value of copper and manufactures, not including ore, was \$12,457,470. The imports of unmanufactured cotton were 67,398,521 pounds of raw cotton and 7,899,328 pounds of waste or flocks; of cotton cloth, 3,061,790 square yards of unbleached and 61,986,063 square yards of bleached or colored fabrics; of yarns, 5,272,491 pounds; total value of cloth, \$8,513,905. The total value of manufactured articles was \$41,206,239.

There were 135,038 dozen eggs imported. The quantity of emery ore was 197,540 hundredweight; of grains and pulverized or refined emery, 703,739 pounds. The total value of china and earthenware was \$8,645,265.

The imports of fertilizing materials consisted of 4,756 tons of guano and 110,065 tons of crude phosphates, in addition to manufactured fertilizers; total value of fertilizers, \$1,697,986. The quantities of vegetable textile fibers were 6,967 tons of flax, 3,400 tons of hemp, 5,748 tons of isle, 102,693 tons of jute, 42,624 tons of Manila hemp, 76,921 tons of sisal grass, and 10,953 tons of other fibers and grasses; total value of unmanufactured, \$26,373,805, of which \$24,277,262 were free of duty. The imports of manufactures reported were 436,417 pounds of cables and cordage, 5,193,009 pounds of binding twine, 3,901,384 pounds of coir yarn, 2,857,675 pounds of other yarns and threads, 132,354 square yards of carpets, and 832,405 square yards of oilcloths; total value of manufactures, \$31,559,371. Among the fish imports were 1,199,079 pounds of fresh salmon, 7,497,227 pounds of canned and fresh lobsters, 14,395,483 pounds of dried codfish and cured haddock, hake, and pollock, 5,130,813 pounds of smoked and 156,217 barrels of pickled or salt herring, 92,733 barrels of salt mackerel, and 736,658 pounds of pickled or salted salmon. The total value of fish was \$7,472,057, of which \$1,045,240 were free and \$6,426,817 dutiable imports. The imports of fruits and nuts included 36,251,779 pounds of dried currants, 19,902,512 pounds of dates, 8,812,487 pounds of figs, 160,198,056 pounds of lemons, 68,618,938 pounds of oranges, 443,457 pounds of plums and prunes, 10,309,498 pounds of raisins, and 6,317,633 pounds of almonds. The total value of fruits and nuts was \$19,263,592.

The glass imports, of which quantities are reported, were 51,343,339 pounds of unpolished cylinder and crown and common window glass, 2,547,688 square feet of polished cylinder and crown glass, 571 square feet of the same silvered, 119,242 square feet of fluted, rolled, or rough plate glass, 941,879 square feet of cast plate glass, and 45,997 square feet of silvered plate glass. The total value of glass and glassware was \$5,037,931. The import of glue was 5,577,982 pounds. Of gunpowder, 31,212 pounds were imported; of firecrackers, 5,001,176 pounds.

There were 143,890 tons of hay imported. Imports of hides and skins comprised 81,998,818 pounds of goatskins, 163,865,165 pounds of hides of cattle, and 100,070,795 pounds of other skins. The value of hides and skins free of duty was \$38,527,481; dutiable, \$19,408,217. The import of honey was 146,860 gallons. The importation of hops amounted to 2,589,725 pounds.

Of India rubber, 49,377,138 pounds were imported; of rubber scraps for remanufacture, 19,093,547 pounds; of gutta-percha, 427,678 pounds; of gutta-joolatong, 8,701,753 pounds. The iron and steel imports shipped by weight were 147,963,804 pounds of tin plates, terneplates, and taggers' tin, 47,096,595 pounds of wire rods, 4,114,078 pounds of wire and wire manufactures, 580,438 pounds of anvils, and 639,020 pounds of chains. The total value of iron and steel imports, including manufactures but not including ore, was \$20,478,728. The import of ivory was 353,423 pounds; of vegetable ivory, 16,073,505 pounds.

Of lead, 196,378,961 pounds were imported. The import of lime was 48,793,888 pounds. Imports of leather were valued at \$6,519,172; of leather manufactures, \$6,773,024.

The importation of malt liquors in bottles was 1,081,818 gallons, and in casks, etc., 2,228,502 gallons. The quantity of manganese ore and oxide was 747,971,840 pounds.

Of nickel ore and matte, 23,547 tons were imported. The import of oil cake was 208,057 pounds. The quantity of fish and whale oil was 851,372 gallons; of other rendered oil, 18,050 gallons; of

mineral oil, 2,354,720 gallons; of olive oil, 967,702 gallons; total value of oils, \$6,817,780.

The number of dozens of palm-leaf fans was 1,376,682. The importation of parchment paper was 1,061,113 pounds; of rags for paper stock, 92,382,167 pounds. Of slate pencils, 255,012 gross were imported. The quantity of plaster of Paris, or sulphate of lime, was 204,850 tons in the ground state. Of platinum, 7,767 pounds were imported. The quantity of plumbago was 20,597 tons. Among provisions were 49,791 pounds of butter and 13,455,990 pounds of cheese, the chief import in this class; total value of provisions, \$2,285,383.

The quantity of rice imported free from the Hawaiian Islands was 596,100 pounds, and of rice paying duty 93,052,351 pounds, besides 23,031,440 pounds of rice flour, rice meal, and broken rice; total value of rice, \$2,279,036.

The importation of salt was 410,792,440 pounds. Of linseed, 67,379 bushels were imported. The total value of seeds was \$1,795,048. The imports of raw silk were 30,004 pounds of cocoons and 11,259,310 pounds of reeled silk, besides 1,784,404 pounds of waste; and of spun silk in skeins, caps, warps, or on beams, 2,420,552 pounds. The value of raw silk imports was \$45,329,760; of silk manufactures, \$30,694,373. Of velvets and pile silks, 708,354 pounds were imported. The imports of fancy soaps amounted to 809,299 pounds. Spices imported free were 1,590,811 pounds of nutmegs, 13,085,333 pounds of black and white pepper in the grain, and 19,652,652 pounds of other unground spices; and on 4,516,709 pounds of spices duty was paid; total value of spices, \$3,401,265. The number of gallons of domestic spirits returned, subject to the internal revenue tax, was 687,024 proof; of foreign brandy brought in, 244,100; of other foreign spirits, 1,550,896; total value of spirits, \$3,609,831. Of starch, 11,767,924 pounds were imported. The import of straw was 5,495 tons. Sugar imports comprised 14,435 gallons of molasses free of duty and 7,010,633 gallons of dutiable molasses, 701,539,452 pounds of beet, 504,713,105 pounds of free cane, and 2,800,374,691 pounds of dutiable cane sugar below No. 16 Dutch standard in color, and 11,459,282 pounds above the standard. Of the raw beet sugar, 95,221,922 pounds came from Austria, 15,142,873 pounds from Belgium, 588,933,642 pounds from Germany, 2,239,776 pounds from England, and 1,239 pounds from other countries; of the raw cane sugar, 7,135,681 pounds from England, 3,869 pounds from Canada, 3,907,397 pounds from Central America, 1,891,917 pounds from Mexico, 200,479,351 pounds from the British West Indies, 705,455,920 pounds from Cuba, 21,664,980 pounds from the Danish Antilles, 3,378,637 pounds from the Dutch Antilles, 72,558,181 pounds from Porto Rico, 122,206,692 pounds from Santo Domingo, 89,684,600 pounds from Brazil, 1,210,991 pounds from Colombia, 149,715,600 pounds from British Guiana, 13,265,520 pounds from Dutch Guiana, 75,155,975 pounds from Peru, 11,386 pounds from elsewhere in South America, 432,768 pounds from China, 9,840,433 pounds from British India, 1,162,202,854 pounds from the Dutch East Indies, 161,898 pounds from Hong-Kong, 1,076 pounds from Japan, 504,713,105 pounds from Hawaii, 49,490,542 pounds from British Africa, and 74,015,702 pounds from Egypt; total, 3,305,087,796 pounds, valued at \$85,059,367. The total imports of beet and cane sugar were 4,018,986,530 pounds, value \$100,250,974. The import of sulphur ore was 367,328 tons.

The number of barrels of tar and pitch was 2,829. The importation of tea was 84,845,107 pounds, of which 1,541,930 pounds were exported again, leaving 83,303,177 pounds for consumption,

or 1.09 pound per head of population, of the total value of \$10,325,987 and an average price of 12.4 cents a pound. The importation of tin in bars, blocks, pigs, or grain, or granulated was 70,158,915 pounds. Of tobacco, 5,561,068 pounds were imported for cigar wrappers, 14,058,559 pounds of fillers and Turkish and other leaf, and 460,559 pounds of cigars and cigarettes; total value of unmanufactured tobacco, 19,619,627 pounds, \$13,297,223; value of manufactures, \$2,364,137.

The import of varnishes was 43,743 gallons. The imports of vegetables were principally 967,031 bushels of beans and dried peas, 546,798 bushels of onions, and 155,861 bushels of potatoes; total value of vegetables, \$2,935,077. Of vinegar, 122,479 gallons were imported.

The imports of champagne were 310,149 dozen bottles; of still wines, 315,920 dozen bottles and 2,533,828 gallons in casks; total value of wines, \$7,421,495. The wood imports included 28,228 thousand feet of mahogany, 101,397 thousand feet of timber logs, 680,226 thousand feet of boards, planks, deals, etc., and 541,040 thousand shingles. Of the total value of wood and timber imports, \$5,956,568 were free and \$14,635,340 paid duty.

The wool imports consisted of 37,404,243 pounds of clothing, 12,631,283 pounds of combing, and 105,892,929 pounds of carpet wool; total, 155,923,455 pounds, valued at \$20,260,936. Of the first class, Australasia, direct or by way of Great Britain, furnished nearly two thirds and the Argentine Republic most of the remainder; of the second class, three quarters came from Great Britain and nearly a sixth from Canada; of the third class, Great Britain and Continental Europe between them supplied more than half, China nearly three tenths, and the Argentine Republic and Asiatic Turkey nearly all the rest. The imports of woolen cloths amounted to 4,924,106 pounds; of wool carpets, 904,296 square yards; of women's and children's dress goods, 25,343,998 square yards; of rags and shoddy, 435,854 pounds; of woolen yarns, 185,262 pounds; total value of woolen manufactures, \$16,164,446.

The importation of zinc and spelter was 2,998,116 pounds.

Of the total value of domestic merchandise exported in 1900, amounting to \$1,370,763,571, manufactures, \$433,851,756 in value, form 31.65 per cent.; mining products, \$37,843,742 in value, 2.76 per cent.; forest products, \$52,218,112 in value, 3.81 per cent.; fishery products, \$6,326,620 in value, 0.46 per cent.; and agricultural products, \$835,858,123 in value, 60.98 per cent.

The values of articles of domestic produce and manufacture exported in the year ending June 30, 1900, are given in the following table:

Agricultural implements:	Value.
Mowers and reapers, and parts of	\$11,248,763

Total value of domestic exports \$1,370,763,571

The exports of agricultural implements had a total value of \$16,099,149. The total value of live animals exported was \$43,585,031, representing 397,286 cattle, 51,180 hogs, 64,722 horses, 43,369 mules, 125,772 sheep, and some fowls and other animals. Nearly all the cattle, nearly half the horses, and three fifths of the sheep went to Great Britain.

The export of beeswax was 319,370 pounds. The total value of breadstuffs was \$262,744,078, representing 23,661,662 bushels of barley, 166,604 tons of bran and ground feed, 18,329,815 pounds of bread and biscuit, 426,822 bushels of buckwheat, 209,348,284 bushels of corn, 943,782 barrels of corn meal, 41,369,415 bushels of oats, 66,229,950 pounds of oatmeal, 2,355,792 bushels of rye, 4,370 barrels of rye flour, 101,950,389 bushels of wheat, 18,099,194 barrels of wheat flour and breakfast foods and

other farinaceous preparations, the export of which is growing rapidly. Of the corn exports, 192,519,785 bushels went to Europe, England taking 85,318,727 bushels, Germany 46,256,978 bushels, the Netherlands 23,584,536 bushels, Denmark 18,863,565 bushels, Belgium 9,618,054 bushels, and France 5,297,212 bushels, and what did not go to Europe was distributed among American countries. Of the wheat, 96,905,756 bushels went to Europe, 62,774,870 bushels of it to Great Britain, and the rest mainly to the Netherlands, Germany, Belgium, and Portugal. Of the wheat flour, Great Britain took 10,257,028 barrels, the Netherlands 1,300,602 barrels, the West Indies 1,723,887 barrels, South America 1,155,988 barrels, and Asia 2,225,169 barrels.

In the class of chemicals, drugs, dyes, and medicines the export of potash and pearlsh was 1,273,905 pounds; of copper sulphate, 44,863,790 pounds; of ginseng, 160,901 pounds; of acetate of lime, 47,790,765 pounds. The export of anthracite coal was 1,777,319 tons; of bituminous coal, 5,411,329 tons. Of copper ore, 7,285 tons were exported, less than a fifth as much as in 1891, but nearly ten times as much of manufactured copper, the shipments of which amounted to 333,340,725 pounds. Of the exports of raw cotton, 6,090,144 bales, consisting of 18,199,967 pounds of sea island and 3,082,383,221 pounds of upland cotton, besides 25,642,400 pounds of waste, Europe took 2,868,207,089 of the 3,100,583,188 pounds, 1,151,045,166 pounds going to the United Kingdom, 809,586,393 pounds to Germany, 368,046,012 pounds to France, 221,975,537 pounds to Italy, and 123,306,186 pounds to Spain; and of the cotton that did not go to Europe, 161,601,219 pounds were shipped to Japan and Canada used 54,991,353 pounds. The exports of cotton cloth comprised 87,880,515 yards of colored goods and 264,314,474 yards of uncolored. The value of raw cotton exports was \$241,832,737 and of cotton manufactures \$24,003,087.

There were 5,920,727 dozen eggs exported, the export having increased twentyfold in four years.

The exports of fertilizers consisted of 776,220 tons of crude phosphates and 38,996 tons of commercial fertilizers. The cordage exports amounted to 8,441,995 pounds. The fish exports included 1,557,005 pounds of fresh fish, 9,739,573 pounds of dried cod, etc., 3,706,897 pounds of smoked or cured herring, 963,774 pounds of other smoked or dried fish, 1,142 barrels of salt mackerel, 20,693 barrels of other salt fish, and 27,082,370 pounds of canned salmon. The total value of fish exports was \$5,427,469. The quantities of dried fruits exported were 34,964,010 pounds of apples, 25,922,371 pounds of prunes, and 2,415,456 pounds of raisins, besides peaches, apricots, and others not specified; the quantity of fresh apples, 526,636 barrels; total value of fruits and nuts, \$11,642,662.

The export of glucose was 221,901,450 pounds; of glue, 2,349,014 pounds; of gunpowder, 1,612,822 pounds.

The export of hay was 72,716 tons. Of hides, 7,486,256 pounds were shipped abroad. The hop exports were 12,639,474 pounds.

The exportation of India-rubber boots and shoes has steadily increased, amounting in 1900 to 767,104 pairs. The total value of rubber manufactures was \$2,631,041. The export of iron ore was 40,510 tons. Of raw iron, 160,674 tons were sent abroad; of scrap and old iron, 48,111 tons. The exportation of bar iron was 18,456,435 pounds; of steel rods for wire, 25,953,749 pounds; of other rods, 73,075,212 pounds; of billets, ingots, and blooms, 14,109 tons; of hoop, band, and scroll iron, 2,947,464 pounds; of iron rails, 6,149 tons; of steel rails, 341,656 tons; of iron sheets and plates,

18,181,278 pounds; of steel sheets and plates, 79,525,672 pounds; of tin plates, 319,579 pounds; of structural iron and steel, 56,275 tons; of wire, 236,772,806 pounds. The number of car wheels was 25,518; of safes, 2,374; of steam fire engines, 4; of locomotive engines, 525; of stationary engines, 1,140. The quantity of cut nails and spikes was 24,915,866 pounds; of wire nails, 84,635,468 pounds; of miscellaneous nails, 4,341,249 pounds. The total value of iron and steel exports was \$121,913,548, of which machinery alone made \$55,485,495.

The export of lead was 308,509 pounds; of type, 356,442 pounds. The quantity of sole leather exported was 34,060,296 pounds. Of boots and shoes, 11,913,256 pairs were sold abroad. The total value of leather exports was \$27,293,010. The export of lime was 81,647 barrels.

The export of malt was 296,742 bushels, and of beer 1,578,240 dozen bottles and 761,411 gallons. The number of organs taken abroad was 16,182, and of pianofortes 1,760; total value of musical instruments, \$1,958,779.

The exports of naval stores, of the total value of \$12,474,194, were 2,369,118 barrels of rosin, 36,535 barrels of tar, 20,246 barrels of turpentine and pitch, and 18,090,582 gallons of spirits of turpentine. Of nickel and oxide the export was 5,317,677 pounds.

Shipments of oil cake and meal were 1,143,704,342 pounds of cotton seed and 483,130,182 of flaxseed. The export of lard oil was 738,724 gallons, and of whale oil 60,214 gallons, both diminishing quantities; of fish oil, 795,642 gallons; of other animal oils, 381,161 gallons; total value of animal oils, \$718,997. The exports of mineral oils were 133,023,656 gallons of crude or natural oils of all kinds, without regard to gravity; 21,988,093 gallons of naphthas, including all the lighter products of distillation; 721,027,637 gallons of illuminating oil; 74,583,769 gallons of lubricating and heavy paraffin oil; and 395,933 barrels of residuum, including tar and all other from which the lighter bodies have been distilled. The total value of mineral oils was \$75,611,750. Of the total exports of illuminating oil, 506,651,963 gallons went to Europe, the largest quantities being 146,477,760 gallons to the United Kingdom, 124,542,723 gallons to Germany, 121,135,337 gallons to the Netherlands, and 43,675,550 gallons to Belgium; 17,586,808 gallons went to Canada and other parts of North America and the West Indies; 39,930,195 gallons went to Brazil, the Argentine Republic, and other parts of South America; 126,781,065 gallons went to Japan, China, and other Asiatic countries; 20,788,133 gallons went to Australasia and the Pacific islands; and 5,981,035 went to South Africa and 3,307,838 to other parts of Africa. The exports of corn oil were 4,383,926 gallons; of cotton-seed oil, 46,902,390 gallons; of linseed oil, 103,494 gallons; of oil of peppermint, 80,558 pounds; total value of vegetable oils, \$16,345,056.

The exports of paints and colors were valued at \$1,902,367. The quantity of zinc oxide was 11,895,590 pounds. Paper exports amounted in value to \$6,215,833, two fifths of it coming from 99,308,300 pounds of printing paper. The export of paraffin wax was 182,153,718 pounds. Under the head of provisions, the exports were 55,553,745 pounds of canned beef, 329,078,609 pounds of fresh beef, 47,306,513 pounds of pickled beef, 2,319,165 pounds of beef cured otherwise, 89,030,943 pounds of tallow, 512,153,729 pounds of bacon, 196,414,412 pounds of hams, 8,496,074 pounds of canned pork, 25,946,905 pounds of fresh pork, 133,199,683 pounds of salted or pickled pork, 661,813,663 pounds of lard, 25,852,685 pounds of lard compounds and sub-

stitutes, such as cottolene and lardine, 773,760 pounds of mutton, 140,730,681 pounds of margarine oil, 4,256,067 pounds of oleomargarine or imitation butter, 18,266,371 pounds of butter, and 48,419,353 pounds of cheese. Of the canned beef, 32,273,374 pounds were shipped to Great Britain out of 39,565,952 pounds taken by Europe, 1,726,418 pounds to North American countries, and 11,241,395 pounds to South Africa; of fresh beef, 324,260,115 pounds were sent to England; of pickled and salted beef, 18,125,780 pounds to England, 5,827,031 pounds to Germany, and 11,419,805 pounds to British colonies in America and other parts of North America; of salted and pickled pork, 88,197,070 pounds went to Europe, two thirds of it to England and to Germany an eighth, and 40,231,487 pounds went to North America; of tallow, 82,712,822 pounds to Europe, England taking 43,514,592 pounds, and Germany, France, and Holland each a goodly share; of lard, 573,641,735 pounds were consumed in Europe, Great Britain taking 217,486,742 pounds and Germany 195,595,578 pounds, and the part that was not absorbed by Europe was distributed throughout North and South America; of bacon, 393,680,472 pounds went to the United Kingdom, 26,027,162 pounds to Germany, 27,812,949 pounds to Belgium, 12,221,663 pounds to France, 12,308,661 pounds to Cuba, 11,488,396 pounds to Sweden and Norway, and 10,094,324 pounds to Italy; of hams, Great Britain took 165,761,659 pounds, Belgium 8,570,337 pounds, and Cuba 7,087,793 pounds; of butter, 11,082,044 pounds went to England, 3,846,226 pounds mainly to British America and the West Indies, and 2,287,157 pounds to South America; of cheese, 44,021,088 pounds were sent to the United Kingdom and the rest to British America and the West Indies except a small fraction sent to other American countries. The total value of provisions was \$184,453,055.

The export of quicksilver was 1,071,585 pounds.

The shipments of rice were 12,947,009 pounds; of rice bran, meal, and polish, 28,119,408 pounds.

The salt export was 12,731,919 pounds. Of the seeds, valued at \$7,036,982, the quantities given are 32,069,371 pounds of clover seed, 49,855,238 pounds of cotton seed, 2,743,266 bushels of flaxseed, and 15,078,186 pounds of timothy. Soap exports were, exclusive of toilet soap, 36,239,193 pounds. The export of spermaceti was 235,781 pounds. The exports of distilled spirits, valued at \$2,278,111, were 540,799 gallons of wood alcohol, reduced to proof, 177,974 gallons of alcohol, including pure, neutral, or cologne spirits, 80,259 gallons of brandy, 670,410 gallons of rum, 863,241 gallons of bourbon whisky, 91,721 gallons of rye whisky, and 18,585 gallons of other spirits. The exportation of starch was 124,935,963 pounds. The value of sugar exports was \$2,697,671, including 3,892,374 gallons of molasses, 11,139,770 gallons of sirup, 322,252 pounds of brown sugar, and 22,192,351 pounds of refined sugar.

The exports of leaf tobacco amounted to 334,604,210 pounds; of stems and trimmings, 10,051,487 pounds; of cigars, 2,579 thousand; of cigarettes, 1,164,356 thousand; of plug, 12,198,474 pounds; total value of tobacco exports, \$35,432,512. Of the leaf tobacco, 121,793,251 pounds were sent to the United Kingdom, 52,525,167 pounds to Germany, 38,584,488 pounds to France, 38,372,301 pounds to Italy, 10,932,942 pounds to the Netherlands, 17,122,797 pounds to Belgium, 13,772,478 pounds to Spain, and 9,955,645 pounds to Canada.

The export of varnish was 588,545 gallons. The exports of fresh vegetables were 617,355 bushels of beans and peas, 171,636 bushels of onions, 809,472

bushels of potatoes, the total value, including canned and pickled, being \$2,853,278. The tonnage of vessels sold abroad was for steamers 1,032 and for sailing vessels 687 tons.

The export of whalebone was 196,001 pounds. Wine exports were valued at \$625,992, consisting of 9,854 dozens of bottled wine and 1,408,859 gallons in casks. The total value of timber and wood manufactures was \$50,598,416, including 473,542 thousand feet of sawed timber, 4,410,741 cubic feet of hewn timber, 1,046,758 thousand feet of boards, 41,043 thousand feet of joists and scantling, 86,118 thousand shingles, 773,019 shooks, 49,011,533 staves, and 28,554,801 pounds of wood pulp. The quantity of raw wool exported was 2,200,309 pounds; the value of wool manufactures was \$1,300,302, including 146,113 yards of carpet, 38,166 yards of dress goods, and blankets, clothing, and various other manufactures.

The export of zinc ore was 32,101 tons; of manufactured zinc, 31,847,685 pounds; value of zinc and manufactures thereof, excluding ore, \$1,669,215.

The merchandise imports from the various foreign countries in the year ending June 30, 1900, had the following values:

COUNTRIES.	Free.	Dutiable.	Total.
<i>Europe.</i>			
Austria-Hungary.....	\$1,467,860	\$7,611,798	\$9,079,657
Azores and Madeira.....	8,538	10,638	19,176

The total value of imports from the United Kingdom was \$159,582,401, of which \$52,804,130 were free and \$106,778,271 dutiable. The total from the Dominion of Canada and Newfoundland was \$39,931,833, of which \$12,431,242 were free and \$27,500,591 dutiable. Of the total imports, 61.84 per cent. came from Europe, 15.30 per cent. from North America, 11.02 per cent. from South America, 16.45 per cent. from Asia, 4.07 per cent. from Oceania, and 1.32 per cent. from Africa.

The imports into the United States from Cuba, Porto Rico, Hawaii, and the Philippine and Samoan Islands for the year ending June 30, 1900, amounted to over \$60,000,000, of which over \$40,000,000 were for sugar and molasses, \$10,000,000 for tobacco, \$5,000,000 for vegetable fibers, \$1,000,000 for iron, copper, and manganese, and \$4,000,000 for miscellaneous products, including coffee, cacao, sponges, tropical fruits, vegetables, hides and skins, and cabinet woods. One third of the sugar imports came from these dependencies. The imports from Cuba, according to the provisional reports, were sugar of the value of \$16,022,983; unmanufactured tobacco, \$7,298,946; molasses, \$437,776; iron ore, \$737,287; cabinet woods, \$348,504; fruit, \$261,109; copper, \$248,028; manganese ore, \$246,148; cacao, \$164,570; sponges,

\$90,045,256 were domestic and \$7,292,238 foreign exports. Of the total exports, 74.60 per cent. went to Europe, 13.45 per cent. to North America, 2.79 per cent. to South America, 4.66 per cent. to Asia, 3.11 per cent. to Oceania, and 1.39 per cent. to Africa.

The value of merchandise received from foreign countries for immediate transit across United States territory in 1900 was \$98,551,462. Of the total value of imports, \$44,412,509 came by land vehicles, \$104,304,940 by sea in American vessels, and \$701,223,735 in foreign vessels. Of the total exports, \$110,483,141 went by land, \$90,779,252 in American vessels, and \$1,193,220,689 went in foreign vessels. The percentage of the carrying trade that was taken in American vessels was 12.9 per cent. of the imports and 7.1 per cent. of the exports by sea; of the whole sea-borne trade, which amounted to \$2,089,528,616, the proportion that was conveyed in American vessels was computed at 9.3 per cent.

The value of imported merchandise entered for consumption during the fiscal year 1900 was \$830,519,252, of which \$306,759,922, 44.16 per cent. of the whole, was the value of free imports and \$463,759,330 that of dutiable merchandise, on which \$229,360,771 of duties were collected, an average

rate of 49.46 per cent. on dutiable and of 27.62 per cent. on free and dutiable merchandise together. The consumption of imported merchandise was \$10.88 per capita, and the duty collected \$3.01 per capita. Articles of food and live animals, forming 26.02 of the total imports and having a value of \$216,107,303, of which \$91,128,161 represent free and \$124,979,142 dutiable imports, paid \$78,236,070 in duties, 34.26 per cent. of all duties collected, the average rate collected on this class being 62.60 per cent. ad valorem. Articles in a crude condition which enter into the various processes of domestic industry had a value of \$299,351,033, being 36.04 per cent. of the total value of imports entered for consumption, and in this class the value of \$241,835,502 was free merchandise, while on \$57,515,531 duties were collected, at the average rate of 26.96 per cent. ad valorem, to the amount of \$15,508,205, being 6.79 per cent. of the total collections. Articles wholly or partially manufactured for use as materials in the manufactures and mechanic arts had a value of \$80,575,042, which was 9.70 per cent. of the total imports consumed, \$17,824,360 of this class being duty free and \$62,750,682 paying \$17,092,946 in duties, an average rate of 27.24 per cent., giving 7.48 per cent. of the whole tariff revenue. Of articles manufactured and ready for consumption, \$130,577,155 in value, forming 15.72 per cent. of the total imports, \$10,470,846 were free and \$120,097,309 dutiable, paying at the average rate of 51.02 per cent. ad valorem \$61,270,378, or 26.83 per cent. of all duties collected. The value of articles of voluntary use and luxuries was \$103,008,719, 12.51 per cent. of all importations, of which sum \$5,492,053 were free of duty and \$98,416,666 paid an average rate of 57.16 per cent. and yielded \$56,256,957, that being 24.63 per cent. of the total duty that was collected.

The imports of silver, including ore, in 1900, were \$35,256,302 in coining value, and the exports were \$52,464,345 of domestic and \$4,247,930 of foreign, giving an excess of exports of \$21,455,973. The value of silver imported in ore was \$24,219,950. The imports of gold coin and bullion in 1900 were \$44,573,184, and the exports were \$48,266,759, of which \$46,693,893 were domestic and \$1,572,866 foreign. The excess of exports was \$3,693,575, while in 1899 there was an excess of imports amounting to \$51,432,517.

The production of gold from mines in the United States in 1899, according to the report of the Director of the Mint, was 3,437,210 ounces, or in value \$71,053,400, of which \$25,982,800 came from Colorado, \$15,197,800 from California, \$6,469,500 from South Dakota, \$5,459,500 from Alaska, \$4,760,100 from Montana, \$3,450,800 from Utah, \$2,568,100 from Arizona, \$2,219,000 from Nevada, \$1,889,000 from Idaho, \$1,429,500 from Oregon, \$685,400 from Washington, \$584,100 from New Mexico, \$160,100 from South Carolina, \$113,000 from Georgia, \$34,500 from North Carolina, and \$52,200 from Texas, Michigan, and other States. The production of silver in the United States was reported to be 54,764,000 ounces, having a commercial value of \$32,859,000 and a coining value of \$70,806,000, of which Colorado produced \$29,301,527, Montana \$20,810,990, Utah \$9,171,135, Arizona \$2,040,630, Nevada \$1,090,457, California \$1,065,762, Texas \$672,323, New Mexico \$650,731, Washington \$330,990, South Dakota \$188,251, Alaska \$181,140, Oregon \$173,641, Michigan \$145,843, and Georgia, South Carolina, North Carolina, and other States \$3,201.

Banking and Currency.—The amount of money in circulation on July 1, 1900, was reported by the Secretary of the Treasury to be \$2,065,-

150,998, equal to \$26.94 per capita. It consisted of \$1,442,247,405 of currency of all descriptions and \$612,903,593 of certificates against which an equivalent of the appropriate kinds of money was held in the Treasury for redemption on demand. The total was made up of \$610,806,472 of gold coin, \$200,733,019 of gold certificates, \$65,889,346 of standard silver dollars, \$408,465,574 of silver certificates, \$76,160,988 of subsidiary coin, \$3,705,000 of currency certificates, \$313,971,545 of United States notes, \$300,115,112 of national bank notes, and \$75,303,942 of fractional currency. The money in the Treasury, exclusive of the sums against which certificates had been issued, was \$284,549,675, made up of \$222,844,953 of gold coin and bullion, \$15,749,107 of standard silver dollars, \$6,702,754 of subsidiary coin, \$29,004,471 of United States notes, \$9,525,332 of national bank notes, and \$723,058 of fractional currency. The amounts of the various kinds of money in the country were \$103,384,444 of gold, \$408,465,574 of standard silver dollars, \$82,863,742 of subsidiary coin, \$346,681,016 of United States notes, \$309,640,444 of national bank notes, and \$76,027,000 of fractional currency. The coinage of the United States mints in 1899 was \$111,344,220 of gold, \$26,061,519 of standard silver dollars, and \$1,837,451 of minor coins; total, \$139,243,191.

There were 3,871 national banks doing business on Sept. 5, 1900, having \$3,281,000,000 of deposits net, against which they held reserves amounting to \$983,300,000, or 29.7 per cent., the legal reserve being \$684,100,000, their reserves consisting of \$518,400,000 of lawful money, \$450,700,000 due from agents, and \$14,200,000 redemption fund. The resources and liabilities of the banks, according to the report of the Comptroller of the Currency, were on that date as follow:

Resources:	
Loans	\$2,709,900,000
Bonds for circulation	294,900,000
Other United States bonds	113,900,000
Stocks and securities	867,300,000
Due from banks	736,400,000
Real estate	26,000,000
Specie	573,300,000
Legal tender notes	145,000,000
National bank notes	25,400,000
Clearing-house exchanges	124,500,000
United States certificates	2,100,000
Due from United States Treasurer	15,900,000
Other resources	113,500,000
Total resources	\$5,048,100,000
Liabilities:	
Capital stock	\$630,300,000
Surplus fund	261,900,000
Undivided profits	127,600,000
Circulation	258,900,000
Due to depositors	2,506,300,000
Due to banks	1,096,600,000
Other liabilities	139,600,000
Total liabilities	\$5,048,100,000

The specie and coin certificates held by the national banks consisted of \$103,752,172 of gold coin, \$115,018,140 of Treasury certificates, \$93,390,000 of clearing-house certificates, \$8,782,306 of silver dollars, \$7,144,233 of fractional coin and \$45,243,559 of silver certificates; total, \$373,328,410.

The resources and liabilities of 1,002 savings banks were reported as follow:

Resources:	
Loans on real estate	\$914,066,518
Loans on other securities	253,719,198
United States bonds	111,118,450
State and other stocks and bonds	518,971,965
Railroad bonds and stocks	290,488,662
Bank stock	34,607,547
Real estate	56,651,224
Other investments	364,572,439
Due from banks	113,562,042
Cash	22,115,609
Total resources	\$3,624,668,634

Liabilities:	
Deposits	\$2,369,719,954
Surplus fund	184,919,263
Undivided profits	21,907,662
Capital stock, etc.	28,338,755
Total liabilities	\$2,604,875,634

There were 6,107,083 depositors having \$2,449,547,885 of savings deposits, of which \$939,790,300 were in the Eastern, \$1,148,691,356 in the Middle, \$14,840,199 in the Southern, \$185,806,444 in the Western, and \$160,419,586 in the Pacific States.

Navigation.—The tonnage of vessels entered from foreign countries at the seaports of the United States during the year ending June 30, 1900, was 23,533,597 tons, of which 3,974,239 tons were American and 19,559,358 tons foreign. The tonnage of sailing vessels entered was 3,245,874 tons, of which 923,561 tons were American and 2,322,313 tons foreign; the steam tonnage was 20,287,723 tons, of which 3,050,678 tons were American and 17,237,045 tons foreign. The tonnage of vessels cleared for foreign countries during the fiscal year 1900 was 23,617,658 tons, of which 4,006,114 tons were American and 19,611,544 tons foreign. The tonnage of sailing vessels cleared was 3,298,691 tons, of which 958,489 tons were American and 2,340,202 tons foreign. The steam tonnage cleared was 20,318,967 tons, of which 3,047,625 tons were American and 17,271,342 tons foreign. During the year 783,375 tons were entered from and 832,434 tons cleared for Belgium, 642,654 tons entered from and 1,011,322 tons cleared for France, 2,334,042 tons entered from and 2,706,337 tons cleared for Germany, 798,380 tons entered from and 538,957 tons cleared for Italy, 868,657 tons entered from and 1,303,168 tons cleared for the Netherlands, 443,420 tons entered from and 212,350 tons cleared for Spain, 7,015,528 tons entered from and 7,047,998 tons cleared for the United Kingdom, 1,214,476 tons entered from and 1,301,780 tons cleared for Nova Scotia, New Brunswick, and Prince Edward Island, 1,469,610 tons entered from and 1,465,052 tons cleared for British Columbia, 375,268 tons entered from and 320,518 tons cleared for Central American states, 638,875 tons entered from and 532,397 tons cleared for Mexico, 705,760 tons entered from and 696,485 tons cleared for the British West Indies and British Honduras, 1,341,928 tons entered from and 1,247,752 tons cleared for Cuba, 73,658 tons entered from and 257,765 tons cleared for the Argentine Republic, 500,595 tons entered from and 245,574 tons cleared for Brazil, 336,366 tons entered from and 307,384 tons cleared for Colombia, 132,465 tons entered from and 77,778 tons cleared for British India, 394,801 tons entered from and 456,069 tons cleared for China, 272,491 tons entered from and 256,820 tons cleared for Japan, 141,922 tons entered from and 298,514 tons cleared for Australia and New Zealand, 367,686 tons entered from and 274,769 tons cleared for Hawaii, 157,587 tons entered from and 281,897 tons cleared for British possessions in Africa and adjacent islands, and 2,524,253 tons entered from and 1,944,538 tons cleared for all other countries. Of the total tonnage of American and foreign vessels in foreign commerce entered and cleared 8,176,761 tons were entered and 7,843,529 tons cleared at the port of New York, 2,236,066 tons entered and 1,909,121 tons cleared at Boston, 1,850,650 tons entered and 1,885,959 tons cleared at Philadelphia, 1,677,385 tons entered and 1,775,269 tons cleared at Baltimore, 1,675,434 tons entered and 1,729,008 tons cleared at New Orleans, 1,351,718 tons entered and 1,339,648 tons cleared at San Francisco, 1,103,797 tons entered and

1,173,523 tons cleared at Puget Sound, 724,666 tons entered and 816,834 tons cleared at Galveston, 520,153 tons entered and 595,229 tons cleared at Pensacola, 549,198 tons entered and 505,273 tons cleared at Mobile, 458,105 tons entered and 636,622 tons cleared at Newport News, 344,082 tons entered and 372,919 tons cleared at Portland, Me., 200,593 tons entered and 392,294 tons cleared at Norfolk and Portsmouth, Va., 267,568 tons entered and 343,555 tons cleared at Savannah, 210,884 tons entered and 226,837 tons cleared at Brunswick, 165,378 tons entered and 178,662 tons cleared at Passamaquoddy, 176,073 tons entered and 144,163 tons cleared at Pearl River, 95,007 tons entered and 52,645 tons cleared at Charleston, and 1,750,073 tons entered and 1,705,568 tons cleared at all other seaports. The nationality of the tonnage entered and cleared in the foreign trade at American seaports during the year ending June 30, 1900, is shown in the following table:

NATIONALITY.	TONNAGE.	
	Entered.	Cleared.
American.....	3,974,389	4,006,114
Austrian.....	107,369	129,576
Belgian.....	360,971	365,192
British.....	12,453,113	12,464,019
Danish.....	296,657	298,131
Dutch.....	466,911	441,253
French.....	408,008	414,814
German.....	2,690,489	2,702,791
Italian.....	390,111	393,942
Norwegian and Swedish.....	1,710,814	1,723,247
Portuguese.....	65,053	60,445
Russian.....	79,398	82,080
Spanish.....	358,539	365,428
All other.....	242,015	332,685
Total.....	23,533,597	23,617,658

The number of sailing vessels, including canal boats and barges, registered as belonging in the United States on June 30, 1900, was 16,280, of 2,507,042 tons; the number of steam vessels was 7,053, of 2,657,797 tons; total merchant marine, 23,333 vessels, of 5,164,839 tons. The tonnage owned on the Atlantic and Gulf coasts was 2,727,892 tons; on the Pacific coast, 601,212 tons; on the Northern lakes, 1,565,587 tons; on the Western rivers, 258,456 tons. The steam tonnage employed in the foreign trade in 1900 was 337,356 tons, and the total tonnage of American vessels in the foreign trade was 816,795 tons; steam tonnage in coastwise trade, 2,289,825 tons; total tonnage of coasting vessels, 4,286,516 tons; steam tonnage in the whale fisheries, 3,986 tons; total tonnage in the whale fisheries, 9,899 tons; tonnage in cod and mackerel fisheries, 51,629 tons. The total tonnage of American vessels, 5,164,839 tons, shows an increase of 6.18 per cent. over the previous year, which recorded an advance of 2.41 per cent. over 1898, in which year there was a slight decrease in American tonnage as compared with 1897. There were 504 sailing vessels, of 116,460 tons, built in the United States in 1900; steam vessels built, 422, of 202,528 tons; canal boats, 38, of 4,492 tons; barges, 483, of 40,310; total, 1,447 vessels, of 393,790 tons, compared with 1,273, of 300,038 tons, in 1899 and 952, of 180,458 tons, in 1898. On the New England coast there were 199 vessels built, of 72,179 tons; on the entire seaboard, 1,107 vessels, of 249,006 tons; on the Mississippi river and tributaries, 215 vessels, of 14,173 tons; on the Great Lakes, 125 vessels, of 130,611 tons. Among the sailing vessels built in the United States in 1900 were 10, of 28,903 tons, built of steel, and of the steam vessels 80, of 167,948 tons.

Railroads.—The length of railroads in operation in the United States on Dec. 31, 1899, was 190,833 miles, 3,981 miles having been added during the year. The total length in 1889 was 161,326 miles; in 1879, 86,556 miles; in 1869, 46,844 miles; in 1859, 28,789 miles; in 1849, 7,365 miles; in 1839, 2,302 miles. Of the total mileage in 1899, the New England States had 7,447 miles; Middle Atlantic States, 22,206 miles; Central Northern States, 40,849 miles; Southern Atlantic States, 21,232 miles; Gulf and Mississippi valley, 15,717 miles; Southwestern States, 36,942 miles; Northwestern States, 31,227 miles; Pacific States, 15,209 miles. The total capital stock, returned for 187,781 miles in 1899, was \$5,742,181,181; funded debt, \$5,644,858,027; floating debt, \$305,777,858; total liabilities, \$11,692,817,066; average total cost of construction, \$62,268 per mile. The gross earnings in 1899 were \$1,336,096,379, being 11.4 per cent. on the total liabilities, receipts from passenger traffic being \$297,559,712, from freight \$922,436,314, and miscellaneous receipts \$116,100,353. The interest paid on bonds and other debt was \$245,250,364 during 1899, the average rate being 4.12 per cent., and the dividends paid on stock amounted to \$109,032,252, an average rate of 1.90 per cent. The gross earnings per mile were \$7,161 on the average; net earnings, \$2,400 per mile, the percentage of expenses to earnings having been 66.49, against 68.16 per cent. in 1898, 69.74 per cent. in 1897, and 70.43 per cent. in 1896. The number of passengers carried in 1899 was 537,977,301; passengers carried 1 mile, 14,859,541,965, making average passenger receipts per mile just 2 cents; freight carried, 975,789,941 tons; tons carried 1 mile, 126,091,703,110, making average freight receipts 0.73 cent per ton per mile. The gross earnings of 190,406 miles for the year ending June 30, 1900, were \$1,480,673,054, or \$7,776 per mile of line, \$366,860,760 of the total being passenger and \$1,048,268,875 freight earnings. Operating expenses amounted to \$956,814,142, or \$5,025 per mile. The net earnings were \$523,818,912, or \$73,110,747 more than in 1899. Including \$60,675,700 of income from investments and other sources, the total net income was \$584,534,612, out of which \$109,400,147 were paid in dividends, \$27,555,388 more than in 1899, and the total deductions, including interest on bonds, rents for leased lines, and \$44,396,165 of taxes, were \$395,811,056, leaving a surplus of \$79,323,409, compared with \$53,064,877 in 1899.

Telegraphs.—The Western Union Telegraph Company had 192,705 miles of line and 933,153 miles of wire in operation on June 30, 1900. The number of messages sent during the year was 63,167,783. Receipts were \$24,758,570, and expenses \$18,593,206, leaving \$6,165,364 profits, showing an average toll per message of 30.8 cents and an average cost of 25.1 cents. The Postal Telegraph Company has 26,042 miles of cable and land lines, with 169,236 miles of wire, and during 1900 sent 16,528,444 messages. The total length of telegraph lines in the United States open for public business, excluding railroad, Government, and private lines, exceeds 210,000 miles.

The Bell Telephone Company, on Jan. 1, 1900, had 1,239 exchanges and 1,187 branch offices, and 509,036 miles of wire on poles, 15,087 miles on buildings, 489,250 miles underground, and 3,404 miles submarine, making a total of 1,016,777 miles. The total number of circuits was 422,620; number of employees, 25,741; number of subscribers, 632,946. The aggregate length of telephone wires operated is 1,518,609 miles, the number of conversations about 1,666,000,000 per annum.

Presidential Election.—The nomination of William McKinley, of Ohio, who was elected

President of the United States in 1896 by 271 to 176 electoral votes and by a plurality of 601,854 popular votes over William Jennings Bryan, of Nebraska, was not contested in the Republican party, nor was that of Mr. Bryan in the Democratic party except by the Gold Democrats, who in 1896 either abstained from voting or supported the Republican candidate or joined in the dissentient movement of the so-called Jeffersonian Democracy, who under the name of National Democrats nominated John M. Palmer, of Illinois, for President. Before the great parties held their national conventions in 1900 several of the independent parties met to declare their principles and put forward candidates. The fourth annual session of the Supreme Council of the Farmers' Alliance and Industrial Union was held in Washington, D. C., on Feb. 6 and the two following days. The support of the Farmers' Alliance was pledged to the candidates to be chosen by the Democratic party for President and Vice-President, and the following platform was approved:

"Whereas, the Declaration of Independence, as a basis of a republican form of government that might be progressive and perpetual, 'that all men are created equal, that they are endowed with certain inalienable rights, that among these are life, liberty, and the pursuit of happiness, that to secure these rights governments are instituted among men, deriving their just powers from the consent of the governed';

"We hold, therefore, that to restore and preserve these rights under a republican form of government, private monopolies of public necessities for speculative purposes, whether of the means of production, distribution, or exchange, should be prohibited, and whenever such public necessity or utility becomes a monopoly in private hands, the people of the municipality, State, or Union, as the case may be, shall appropriate the same by right of eminent domain, paying a just value therefor, and operate them for and in the interest of the whole people. We demand a national currency, safe, sound, and flexible; issued by the General Government only, a full legal tender for all debts and receivable for all dues, and an equitable and efficient means of distribution of this currency, directly to the people, at the minimum of expense and without the intervention of banking corporations and in sufficient volume to transact the business of the country on a cash basis. We demand the free and unlimited coinage of silver and gold at the legal ratio of 16 to 1. We demand a graduated income tax. That our national legislation shall be so framed in the future as not to build up one industry at the expense of another. We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all national and State revenues shall be limited to the necessary expenses of the Government economically and honestly administered. We demand that postal savings banks be established by the Government for the safe deposit of the savings of the people, and to facilitate exchange. We are unalterably opposed to the issue by the United States of interest-bearing bonds, and demand the payment of all coin obligations of the United States, as provided by existing laws, in either gold or silver coin, at the option of the Government and not at the option of the creditor. The Government shall purchase or construct and operate a sufficient mileage of railroads to effectually control all rates of transportation on a just and equitable basis. The telegraph and telephone, like the post-office system, being a necessity for the transmission of intelligence, should be owned and operated by the

Government in the interest of the people. We demand that no land shall be held by corporations for speculative purposes or by railroads in excess of their needs as carriers, and all lands now owned by aliens should be reclaimed by the Government and held for actual settlers only. We demand the election of United States Senators by a direct vote of the people; that each State shall be divided into two districts of nearly equal voting population, and that a Senator from each shall be elected by the people of the district. Relying upon the good common sense of the American people, and believing that a majority of them, when uninfluenced by party prejudice, will vote right on all questions submitted to them on their merits; and further to effectually annihilate the pernicious lobby in legislation, we demand direct legislation by means of the initiative referendum. We demand free mail delivery in the rural districts. We demand that the inhabitants of all the territory coming to the United States as a result of the war with Spain be as speedily as possible permitted to organize a free government of their own, based upon the consent of the governed."

The next earliest convention was that of the Social-Democrats, who on March 6, at Indianapolis, Ind., nominated Eugene V. Debs, of Indiana, for President, and Job Harriman, of California, for Vice-President, and on March 7 adopted the following platform:

"The Social-Democratic party of America declares that life, liberty, and happiness depend upon equal political and economic rights. In our economic development an industrial revolution has taken place, the individual tool of former years having become the social tool of the present. The individual tool was owned by the worker, who employed himself and was master of his product. The social tool, the machine, is owned by the capitalist, and the worker is dependent upon him for employment. The capitalist thus becomes the master of the worker, and is able to appropriate to himself a large share of the product of his labor. Capitalism, the private ownership of the means of production, is responsible for the insecurity of subsistence, the poverty, misery, and degradation of the ever-growing majority of our people; but the same economic forces which have produced and now intensify the capitalist system will necessitate the adoption of socialism, the collective ownership of the means of production for the common good and welfare. The present system of social production and private ownership is rapidly converting society into two antagonistic classes—i. e., the capitalist class and the propertyless class. The middle class, once the most powerful of this great nation, is disappearing in the mill of competition. The issue is now between the two classes first named. Our political liberty is now of little value to the masses unless used to acquire economic liberty. Independent political action and the trade-union movement are the chief emancipating factors of the working class, the one representing its political, the other its economic wing, and both must co-operate to abolish the capitalist system. Therefore, the Social-Democratic party of America declares its object to be:

"First, the organization of the working class into a political party to conquer the public powers now controlled by capitalists. Second, the abolition of wage slavery by the establishment of a national system of co-operative industry, based upon the social or common ownership of the means of production and distribution, to be administered by society in the common interest of all its members, and the complete emancipation

of the socially useful classes from the domination of capitalism.

"The working class and all those in sympathy with their historic mission to realize a higher civilization should sever connection with all capitalist and reform parties and unite with the Social-Democratic party of America. The control of political power by the Social-Democratic party will be tantamount to the abolition of all class rule. The solidarity of labor connecting the millions of class-conscious fellow-workers throughout the civilized world will lead to international socialism, the brotherhood of man.

"As steps in that direction, we make the following demands:

"First, revision of our Federal Constitution, in order to remove the obstacles to complete control of government by the people irrespective of sex. Second, the public ownership of all industries controlled by monopolies, trusts, and combines. Third, the public ownership of all railroads, telegraphs, and telephones; all means of transportation and communication; all waterworks, gas and electric plants, and other public utilities. Fourth, the public ownership of all gold, silver, copper, lead, iron, coal, and other mines, and all oil and gas wells. Fifth, the reduction of the hours of labor in proportion to the increasing facilities of production. Sixth, the inauguration of a system of public works and improvements for the employment of the unemployed, the public credit to be utilized for that purpose. Seventh, useful inventions to be free, the inventor to be remunerated by the public. Eighth, labor legislation to be national instead of local, and international when possible. Ninth, national insurance of working people against accidents, lack of employment, and want in old age. Tenth, equal civil and political rights for men and women, and the abolition of all laws discriminating against women. Eleventh, the adoption of the initiative and referendum, proportional representation, and the right of recall of representatives by the voters. Twelfth, abolition of war and introduction of international arbitration."

Early in January the national committee of the Union Reform party, which favors direct legislation, appointed a canvassing board, which sent out ballots to members of the party for votes for candidates for President and Vice-President. The balloting continued through February and March. In April the canvassing board announced that Seth H. Ellis, of Ohio, and Samuel T. Nicholson, of Pennsylvania, had been nominated for President and Vice-President respectively on the platform favored at Cincinnati on March 1, 1899: "Direct legislation under the system known as the initiative and referendum. Under the initiative the people can compel the submission to themselves of any desired law, when, if it receives a majority of the votes cast, it is thereby enacted. Under the referendum the people can compel the submission to themselves of any law which has been adopted by any legislative body, when, if such law fails to receive a majority of the votes cast, it will be thereby rejected." The convention adopted an appeal in part as follows: "We accept the strong and unanswerable arguments of our friends. We see no need or benefit from party except a party to secure direct legislation. We have attached ourselves to the Union Reform party for direct legislation only. This party, organized by progressive and active men from this and other States at a time when dominant parties had legislated to make the initiation of reform movements impossible, acted while we were awaiting an opportune hour. We ask our honest, home-loving

fellow-citizens to organize in their respective precincts, and to honestly and fairly extend their organization to county and district, and to assist in controlling and extending the party and movement until the desired object is attained. The majority is with us in this desire for direct government, and with this sole purpose they must act at last. The logic of events, the tyranny of the bosses, and the necessities of the hour assure us. Friends, this securing of a rightful voice is the affair of the individual, of each and every one. Government direct by the people will not come as a voluntary concession from the holders of political power. These controllers of parties will not permit of referendum of acts and expenditures; they will not give to the people initiatory and mandatory rights, because to do so would be to destroy their own useless but lucrative occupations. These party bosses who monopolize political opportunity are the allies and supporters of all monopolies. We all believe that conditions can be made better or worse by legislation. The corporations know this and act accordingly. Truly they contribute to the election of candidates, but their great contributions are direct to the machine."

The United Christian party, a new organization, met at Rock Island, Ill., and on May 2 nominated by acclamation Silas P. Swallow, of Pennsylvania, for President, and John G. Woolley, of Illinois, for Vice-President. These candidates withdrew, and the party, which is devoted to the inculcation of religious and moral ideas as controlling forces in politics and government, put in nomination for the respective offices Jonah F. R. Leonard, of Iowa, and David H. Martin, of Pennsylvania. The convention adopted the following platform:

"We, the United Christian party, in national convention assembled, acknowledging Almighty God as the source of all power and authority, the Lord Jesus Christ as the sovereign ruler of nations, and the Bible as the standard by which to decide moral issues in our political life, do make the following declaration: We believe the time to have arrived when the eternal principles of justice, mercy, and love as exemplified in the life and teachings of Jesus Christ should be embodied in the Constitution of our nation and applied in concrete form to every function of our Government. We deprecate certain immoral laws which have grown out of the failure of our nation to recognize these principles, notably such as require the desecration of the Christian Sabbath, authorize unscriptural marriage and divorce, license the manufacture and sale of intoxicating liquors as a beverage, and permit the sale of cigarettes or tobacco in any form to minors. As an expression of consent or allegiance on the part of the governed, in harmony with the above statements, we declare for the adoption and use of the system of direct legislation known as the 'initiative and referendum,' together with 'proportional representation' and the 'imperative mandate.' We hold that all men and women are created free and with equal rights, and declare for the establishment of such political, industrial, and social conditions as shall guarantee to every person civic equality, the full fruits of his or her honest toil, and opportunity for the righteous enjoyment of the same; and we especially condemn mob violence and outrages against any individual or class of individuals in our country. We declare against war and for the arbitration of all national and international disputes. We hold that the legalized liquor traffic is the crowning infamy of civilization, and we declare for the immediate abolition

of the manufacture and sale of intoxicating liquors as a beverage. We are gratified to note the widespread agitation of the cigarette question, and declare ourselves in favor of the enactment of laws prohibiting the sale of cigarettes or tobacco in any form to minors. We declare for the daily reading of the Bible in the public schools and institutions of learning under control of the State. We declare for the Government ownership of public utilities. We declare for the election of the President and Vice-President and United States Senators by the direct vote of the people. We declare for such amendment of the United States Constitution as shall be necessary to give the principles herein set forth an undeniable legal basis in the fundamental law of our land. We invite into the United Christian party every honest man and woman who believes in Christ and his golden rule and standard of righteousness."

The fusion wing of the People's party held a convention at Sioux Falls, S. D., on May 10, at which William J. Bryan was nominated for President by acclamation. A motion to defer the nomination for Vice-President and appoint a committee to confer with the National Democratic Convention was defeated by 492 to 462 votes. Howard S. Taylor, of Illinois, J. H. Davis, of Texas, E. Gerry Brown, of Massachusetts, J. W. Breidenthal, of Kansas, T. T. Rhinder, of Pennsylvania, and John J. Lentz, of Ohio, withdrew their names when they were brought forward for the nomination in favor of Charles A. Towne, of Minnesota, who was nominated by acclamation, and who withdrew, on Aug. 8, after A. E. Stevenson was nominated by the Democratic convention, and on Aug. 28 the Executive Committee named Mr. Stevenson as the candidate of the party. The following platform was adopted:

"Resolved, that we denounce the act of March 14, 1900, as the culmination of a long series of conspiracies to deprive the people of their constitutional rights over the money of the nation and relegate to a gigantic money trust the control of the purse and hence of the people. We denounce this act, first, for making all money obligations, domestic and foreign, payable in gold coin or its equivalent, thus enormously increasing the burdens of the debtors and enriching the creditors. Second, for refunding coin bonds not to mature for years into long-time gold bonds so as to make their payment improbable and our debt perpetual. Third, for taking from the Treasury over \$50,000,000 in a time of war and presenting it as a premium to bondholders to accomplish the refunding of bonds not due. Fourth, for doubling the capital of bankers by returning them the face value of their bonds in current money notes so that they may draw one interest from the Government and another from the people. Fifth, for allowing banks to expand and contract their circulation at pleasure, thus controlling prices of all products. Sixth, for authorizing the Secretary of the Treasury to issue new gold bonds to an unlimited amount whenever he deems it necessary to replenish the gold hoard, thus enabling usurers to secure more bonds and more bank currency by drawing gold from the Treasury, thereby creating an endless chain for perpetually adding to a perpetual debt. Seventh, for striking down the greenback in order to force the people to borrow \$348,000,000 more from the banks at an annual cost of over \$20,000,000. While barring out the money of the Constitution this law opens the printing mints of the Treasury to the free coinage of bank paper money, to enrich the few and impoverish the many. We pledge anew the People's party never to cease the agitation until this great

financial conspiracy is blotted from the statute books, the Lincoln greenback restored, the bonds all paid, and all corporation money forever retired. We affirm the demand for the reopening of the mints of the United States for the free and unlimited coinage of silver and gold at the present legal ratio of 16 to 1, the immediate increase in the volume of silver coins and certificates thus created to be substituted, dollar for dollar, for the bank notes issued by private corporations under special privilege granted by law of March 14, 1900, and prior national banking laws, the remaining portion of the bank notes to be replaced with full legal-tender Government paper money, and its volume so controlled as to maintain at all times a stable money market and a stable price level. We demand a graduated income and inheritance tax, to the end that aggregated wealth shall bear its just proportion of taxation. We demand that postal savings banks be established by the Government for the safe deposit of the savings of the people and to facilitate exchange. With Thomas Jefferson we declare the land, including all natural sources of wealth, the inalienable heritage of the people. Government should so act as to secure homes for the people and prevent land monopoly. The original homestead policy should be enforced, and future settlers upon the public domain should be entitled to a free homestead, while all who have paid an acreage price to the Government under existing laws should have their homestead rights restored. Transportation being a means of exchange and a public necessity, the Government should own and operate the railroads in the interests of the people and on a nonpartisan basis, to the end that all may be accorded the same treatment in transportation, and that the extortion, tyranny, and political power now exercised by the great railroad corporations, which result in the impairment, if not the destruction, of the political rights and personal liberties of the citizen, may be destroyed. Such ownership is to be accomplished in a manner consistent with sound public policy. Trusts, the overshadowing evil of the age, are the result and culmination of the private ownership and control of the three great instruments of commerce—money, transportation, and the means of transmission of information—which instruments of commerce are public functions, and which our forefathers declared in the Constitution should be controlled by the people through their Congress for the public welfare. The one remedy for the trusts is that the ownership and control be assumed and exercised by the people. We further demand that all tariffs on goods controlled by a trust shall be abolished. To cope with the trust evil, the people must act directly without the intervention of representatives who may be controlled or influenced. We therefore demand direct legislation, giving the people the lawmaking and veto power under the initiative and referendum. A majority of the people can never be corruptly influenced. Applauding the valor of our army and navy in the Spanish War, we denounce the conduct of the administration in changing a war for humanity into a war of conquest. The action of the administration in the Philippines is in conflict with all the precedents of our national life: at war with the Declaration of Independence, the Constitution, and the plain precepts of humanity. Murder and arson have been our response to the appeals of the people who asked only to establish a free government in their own land. We demand a stoppage of this war of extermination by the assurance to the Philippines of independence and the protection under a stable government of their own creation. The Declaration of

Independence, the Constitution, and the American flag are one and inseparable. The island of Porto Rico is a part of the territory of the United States, and by levying special and extraordinary customs duties on the commerce of that island the administration has violated the Constitution, abandoned the fundamental principles of American liberty, and has striven to give the lie to the contention of our forefathers that there should be no taxation without representation. Out of the imperialism which would force an undesired domination on the people of the Philippines springs the un-American cry for a large standing army. Nothing in the character or purposes of our people justifies us in ignoring the plain lesson of history and putting our liberties in jeopardy by assuming the burden of militarism, which is crushing the people of the Old World. We denounce the administration for its sinister efforts to substitute a standing army for the citizen soldiery, which is the best safeguard of the republic. We extend to the brave Boers of South Africa our sympathy and moral support in their patriotic struggle for the right of self-government, and we are unalterably opposed to any alliance, open or covert, between the United States and any other nation that will tend to the destruction of liberty. And a further manifestation of imperialism is to be found in the mining districts of Idaho. In the Cœur d'Alene soldiers have been used to overawe miners striving for a greater measure of industrial independence. And we denounce the State Government of Idaho and the Federal Government for employing the military arm of the Government to abridge the civil rights of the people, and to enforce an infamous permit system which denies to laborers their inherent liberty and compels them to forswear their manhood and their right before being permitted to seek employment. The importation of Japanese and other laborers under contract to serve monopolistic corporations is a notorious and flagrant violation of the immigration laws. We demand that the Federal Government shall take cognizance of this menacing evil and repress it under existing laws. We further pledge ourselves to strive for the enactment of more stringent laws for the exclusion of Mongolian and Malayan immigration. We indorse municipal ownership of public utilities, and declare that the advantages which have accrued to the public under that system would be multiplied a hundredfold by its extension to natural interstate monopolies."

The antifusion or Middle-of-the-Road People's party held a national convention at Cincinnati, Ohio, at the same time as the fusionist convention. Wharton Barker, of Pennsylvania, received the nomination for President on the second ballot by 370 votes to 338 for Milford W. Howard, of Alabama, and 9 scattering. Ignatius Donnelly, of Minnesota, was nominated for the vice-presidency by acclamation. The platform was as follows:

"The People's party of the United States, assembled in national convention this 10th day of May, 1900, affirming our unshaken belief in the cardinal tenets of the People's party as set forth in the Omaha platform, and pledging ourselves anew to continued advocacy of those grand principles of human liberty, until right shall triumph over might and love over greed, do adopt and proclaim this declaration of faith. We demand the initiative and referendum, and the imperative mandate for such changes of existing fundamental and statute law as will enable the people in their sovereign capacity to propose and compel the enactment of such laws as they desire, to reject such as they deem injurious to their interests, and to recall unfaithful public servants. We demand the

public ownership and operation of those means of communication, transportation, and production which the people may elect, such as railroads, telegraph and telephone lines, coal mines, etc. The land, including all natural sources of wealth, is a heritage of the people, and should not be monopolized for speculative purposes, and alien ownership of land should be prohibited. All lands now held by railroads and other corporations in excess of their actual needs, and all lands now owned by aliens, should be reclaimed by the Government and held for actual settlers only. A scientific and absolute paper money, based upon the entire wealth and population of the nation, not redeemable in any specific commodity, but made a full legal tender for all debts, and receivable for all taxes and public dues, and issued by the Government only without the intervention of banks, and in sufficient quantity to meet the demands of commerce, is the best currency that can be devised, but until such a financial system is secured, which we shall press for adoption, we favor the free and unlimited coinage of both silver and gold at the legal ratio of 16 to 1. We demand the levy and collection of a graduated tax on incomes and inheritances, and a constitutional amendment to secure the same, if necessary. We demand the election of President, Vice-President, Federal judges, and United States Senators by direct vote of the people. We are opposed to trusts, and declare the contention between the old parties on the monopoly question is a sham battle, and that no solution of this mighty problem is possible without the adoption of the principles of public ownership of public utilities."

The Socialist-Labor party held a national convention in New York city, and on June 6 nominated for President Joseph F. Malloney, of Massachusetts, and for Vice-President Valentine Rempel, of Pennsylvania. The convention readopted the declaration of principles of 1896, as follows:

"The Socialist-Labor party of the United States, in convention assembled, reasserts the inalienable right of all men to life, liberty, and the pursuit of happiness. With the founders of the American republic we hold that the purpose of government is to secure every citizen in the enjoyment of this right; but in the light of our social conditions we hold, furthermore, that no such right can be exercised under a system of economic inequality, essentially destructive of life, of liberty, and of happiness. With the founders of this republic we hold that the true theory of politics is that the machinery of government must be owned and controlled by the whole people; but in the light of our industrial development we hold, furthermore, that the true theory of economics is that the machinery of production must likewise belong to the people in common. To the obvious fact that our despotic system of economics is the direct opposite of our democratic system of politics can plainly be traced the existence of a privileged class, the corruption of government by that class, the alienation of public property, public franchises, and public functions to that class, and the abject dependence of the mightiest of nations upon that class. Again, through the perversion of democracy to the ends of plutocracy, labor is robbed of the wealth which it alone produces, is denied the means of self-employment, and, by compulsory idleness in wage slavery, is even deprived of the necessaries of life. Human power and natural forces are thus wasted, that the plutocracy may rule. Ignorance and misery, with all their concomitant evils, are perpetuated, that the people may be kept in bondage. Science and invention are diverted from their humane purpose to the enslavement of women and children.

Against such a system the Socialist-Labor party once more enters its protest. Once more it reiterates its fundamental declaration that private property in the natural sources of production and in the instruments of labor is the obvious cause of all economic servitude and political dependence. The time is fast coming when, in the natural course of social evolution, this system, through the destructive action of its failures and crises on the one hand, and the constructive tendencies of its trusts and other capitalistic combinations on the other hand, shall have worked out its own downfall. We therefore call upon the wage workers of the United States, and upon all other honest citizens, to organize under the banner of the Socialist-Labor party into a class-conscious body, aware of its rights and determined to conquer them by taking possession of the public powers; so that, held together by an indomitable spirit of solidarity under the most trying conditions of the present class struggle, we may put a summary end to that barbarous struggle by the abolition of classes, the restoration of the land and of all the means of production, transportation, and distribution to the people as a collective body, and the substitution of the co-operative commonwealth for the present state of planless production, industrial war, and social disorder; a commonwealth in which every worker shall have the free exercise and full benefit of his faculties, multiplied by all the modern factors of civilization."

The Republican National Convention met in Philadelphia, Pa., on June 19. Theodore Roosevelt, Governor of New York, was the candidate for Vice-President favored not only by the delegation from his own State, but by all the Western delegates. He published a request that the convention nominate some one else, and the New York delegation proposed the name of Lieut.-Gov. Timothy L. Woodruff. But the sentiment was so strong in favor of Mr. Roosevelt that in the first ballot on June 21 he received every vote except his own, while Mr. McKinley was renominated unanimously. The platform was adopted in the following shape:

"The Republicans of the United States, through their chosen representatives, met in national convention, looking back upon an unsurpassed record of achievement and looking forward into a great field of duty and opportunity, and appealing to the judgment of their countrymen, make these declarations: The expectation in which the American people, turning from the Democratic party, intrusted power four years ago to a Republican Chief Magistrate and a Republican Congress has been met and satisfied. When the people then assembled at the polls, after a term of Democratic legislation and administration, business was dead, industry paralyzed and the national credit disastrously impaired. The country's capital was hidden away, and its labor distressed and unemployed. The Democrats had no other plan with which to improve the ruinous conditions which they had themselves produced than to coin silver at the ratio of 16 to 1. The Republican party, denouncing this plan as sure to produce conditions even worse than those from which relief was sought, promised to restore prosperity by means of two legislative measures—a protective tariff and a law making gold the standard of value. The people by great majorities issued to the Republican party a commission to enact these laws. This commission has been executed, and the Republican promise is redeemed. Prosperity more general and more abundant than we have ever known has followed these enactments. There is

no longer controversy as to the value of any Government obligation. Every American dollar is a gold dollar, or its assured equivalent, and American credit stands higher than that of any nation. Capital is fully employed and labor everywhere is profitably occupied. No single fact can more strikingly tell the story of what Republican government means to the country than this—that while during the whole period of one hundred and seven years, from 1790 to 1897, there was an excess of exports over imports of only \$383,028,407, there has been in the short three years of the present Republican administration an excess of exports over imports in the enormous sum of \$1,483,537,094. And while the American people, sustained by this Republican legislation, have been achieving these splendid triumphs in their business and commerce, they have conducted, and in victory concluded, a war for liberty and human rights. No thought of national aggrandizement tarnished the high purpose with which American standards were unfurled. It was a war unsought and patiently resisted, but when it came the American Government was ready. Its fleets were cleared for action. Its armies were in the field, and the quick and signal triumph of its forces on land and sea bore equal tribute to the courage of American soldiers and sailors and to the skill and foresight of republican statesmanship. To ten millions of the human race there was given 'a new birth of freedom,' and to the American people a new and noble responsibility.

"We indorse the administration of William McKinley. Its acts have been established in wisdom and in patriotism, and at home and abroad it has distinctly elevated and extended the influence of the American nation. Walking untried paths and facing unforeseen responsibilities, President McKinley has been in every situation the true American patriot and the upright statesman, clear in vision, strong in judgment, firm in action, always inspiring and deserving the confidence of his countrymen. In asking the American people to indorse this Republican record and to renew their commission to the Republican party, we remind them of the fact that the menace to their prosperity has always resided in Democratic principles, and no less in the general incapacity of the Democratic party to conduct public affairs. The prime essential of business prosperity is public confidence in the good sense of the Government and in its ability to deal intelligently with each new problem of administration and legislation. That confidence the Democratic party has never earned. It is hopelessly inadequate, and the country's prosperity when Democratic success at the polls is announced halts and ceases in mere anticipation of Democratic blunders and failures.

"We renew our allegiance to the principle of the gold standard, and declare our confidence in the wisdom of the legislation of the Fifty-sixth Congress, by which the parity of all our money and the stability of our currency upon a gold basis have been secured. We recognize that interest rates are a potent factor in production and business activity, and for the purpose of further equalizing and of further lowering the rates of interest we favor such monetary legislation as will enable the varying needs of the season and of all sections to be promptly met, in order that trade may be evenly sustained, labor steadily employed, and commerce enlarged. The volume of money in circulation was never so great per capita as it is to-day. We declare our steadfast opposition to the free and unlimited coinage of silver. No measure to that end could be considered which was without the support of the leading commer-

cial countries of the world. However firmly Republican legislation may seem to have secured the country against the peril of base and discredited currency, the election of a Democratic President could not fail to impair the country's credit and to bring once more into question the intention of the American people to maintain upon the gold standard the parity of their money circulation. The Democratic party must be convinced that the American people will never tolerate the Chicago platform.

"We recognize the necessity and propriety of the honest co-operation of capital to meet new business conditions, and especially to extend our rapidly increasing foreign trade, but we condemn all conspiracies and combinations intended to restrict business, to create monopolies, to limit production, or to control prices, and favor such legislation as will effectively restrain and prevent all such abuses, protect and promote competition, and secure the rights of producers, laborers, and all who are engaged in industry and commerce.

"We renew our faith in the policy of protection to American labor. In that policy our industries have been established, diversified, and maintained. By protecting the home market competition has been stimulated and production cheapened. Opportunity for the inventive genius of our people has been secured and wages in every department of labor maintained at high rates, higher now than ever before, and always distinguishing our working people in their better conditions of life from those of any competing country. Enjoying the blessings of the American common school, secure in the right of self-government and protected in the occupancy of their own markets, their constantly increasing knowledge and skill have enabled them finally to enter the markets of the world.

"We favor the associated policy of reciprocity so directed as to open our markets on favorable terms for what we do not ourselves produce, in return for free foreign markets.

"In the further interest of American workmen we favor a more effective restriction of the immigration of cheap labor from foreign lands, the extension of opportunities of education for working children, the raising of the age limit for child labor, the protection of free labor as against contract convict labor, and an effective system of labor insurance. Our present dependence upon foreign shipping for nine tenths of our foreign carrying is a great loss to the industry of this country. It is also a serious danger to our trade, for its sudden withdrawal in the event of European war would seriously cripple our expanding foreign commerce. The national defense and naval efficiency of this country, moreover, supply a compelling reason for legislation which will enable us to recover our former place among the trade-carrying fleets of the world. The nation owes a debt of profound gratitude to the soldiers and sailors who have fought its battles, and it is the Government's duty to provide for the survivors and for the widows and orphans of those who have fallen in the country's wars. The pension laws, founded in this just sentiment, should be liberal and should be liberally administered, and preference should be given wherever practicable with respect to employment in the public service to soldiers and sailors and to their widows and orphans. We commend the policy of the Republican party in maintaining the efficiency of the civil service. The administration has acted wisely in its effort to secure for public service in Cuba, Porto Rico, Hawaii, and the Philippine Islands only those whose fitness has been deter-

mined by training and experience. We believe that employment in the public service in these territories should be confined as far as practicable to their inhabitants.

"It was the plain purpose of the fifteenth amendment to the Constitution to prevent discrimination on account of race or color in regulating the elective franchise. Devices of State governments, whether by statutory or constitutional enactment, to avoid the purpose of this amendment are revolutionary and should be condemned. Public movements looking to a permanent improvement of the roads and highways of the country meet with our cordial approval, and we recommend this subject to the earnest consideration of the people and of the Legislatures of the several States. We favor the extension of the rural free-delivery service wherever its extension may be justified. In further pursuance of the constant policy of the Republican party to provide free homes on the public domain, we recommend adequate national legislation to reclaim the arid lands of the United States, reserving control of the distribution of water for irrigation to the respective States and Territories. We favor home rule for and the early admission to statehood of the Territories of New Mexico, Arizona, and Oklahoma. The Dingley act, amended to provide sufficient revenue for the conduct of the war, has so well performed its work that it has been possible to reduce the war debt in the sum of \$40,000,000. So ample are the Government's revenues and so great is the public confidence in the integrity of its obligations that its newly funded 2-per-cent. bonds sell at a premium. The country is now justified in expecting, and it will be the policy of the Republican party to bring about, a reduction of the war taxes.

"We favor the construction, ownership, control, and protection of an isthmian canal by the Government of the United States. New markets are necessary for the increasing surplus of our farm products. Every effort should be made to open and obtain new markets, especially in the Orient, and the administration is warmly to be commended for its successful effort to commit all trading and colonizing nations to the policy of the open door in China. In the interest of our expanding commerce we recommend that Congress create a Department of Commerce and Industries in the charge of a secretary with a seat in the Cabinet. The United States consular system should be reorganized under the supervision of this new department, upon such a basis of appointment and tenure as will render it still more serviceable to the nation's increasing trade. The American Government must protect the person and property of every citizen wherever they are wrongfully violated or placed in peril.

"We congratulate the women of America upon their splendid record of public service in the volunteer aid associations, and as nurses in camp and hospital during the recent campaigns of our armies in the Eastern and Western Indies, and we appreciate their faithful co-operation in all works of education and industry.

"President McKinley has conducted the foreign affairs of the United States with distinguished credit to the American people. In releasing us from the vexatious conditions of a European alliance for the Government of Samoa his course is especially to be commended. By securing to our undivided control the most important island of the Samoan group and the best harbor in the southern Pacific, every American interest has been safeguarded. We approve the annexation of the Hawaiian Islands to the United States. We com-

mend the part taken by our Government in the Peace Conference at The Hague. We assert our steadfast adherence to the policy announced in the Monroe Doctrine. The provisions of The Hague convention were wisely regarded when President McKinley tendered his friendly offices in the interest of peace between Great Britain and the South African republics. While the American Government must continue the policy prescribed by Washington, affirmed by every succeeding President, and imposed upon us by The Hague Treaty, of nonintervention in European controversies, the American people earnestly hope that a way may soon be found, honorable alike to both contending parties, to terminate the strife between them. In accepting by the Treaty of Paris the just responsibility of our victories in the Spanish War the President and the Senate won the undoubted approval of the American people. No other course was possible than to destroy Spain's sovereignty throughout the West Indies and in the Philippine Islands. That course created our responsibility before the world, and with the unorganized population whom our intervention had freed from Spain, to provide for the maintenance of law and order, and for the establishment of good government and for the performance of international obligations. Our authority could not be less than our responsibility, and wherever sovereign rights were extended it became the high duty of the Government to maintain its authority, to put down armed insurrection, and to confer the blessings of liberty and civilization upon all the rescued peoples. The largest measures of self-government consistent with their welfare and our duties shall be secured to them by law. To Cuba independence and self-government were assured in the same voice by which war was declared, and to the letter this pledge will be performed. The Republican party upon its history, and upon this declaration of its principles and policies, confidently invokes the considerate and approving judgment of the American people."

The Prohibition party, in national convention at Chicago, Ill., on June 28, nominated John G. Woolley, of Illinois, for President on the first ballot, which gave 380 votes for him and 329 for Silas C. Swallow, of Pennsylvania, Hale Johnson, of Illinois, withdrawing his name. Henry B. Metcalf, of Rhode Island, received the nomination for Vice-President over Thomas R. Carskadden, of West Virginia, and E. L. Eaton, of Iowa. The platform, adopted on June 27, contained the following declarations:

"We propose as a first step in the financial problems of the nation to save more than a billion dollars every year, now annually expended to support the liquor traffic and to demoralize our people. When that is accomplished, conditions will have so improved that with a clearer atmosphere the country can address itself to the questions as to the kind and quantity of currency needed.

"We reaffirm as true indisputably the declaration of William Windom when Secretary of the Treasury in the Cabinet of President Arthur, that, 'considered socially, financially, politically, or morally, the licensed liquor traffic is or ought to be the overwhelming issue in American politics,' and that 'the destruction of this iniquity stands next on the calendar of the world's progress.' We hold that the existence of our party presents this issue squarely to the American people, and lays upon them the responsibility of choice between liquor parties, dominated by distillers and brewers, with their policy of saloon perpetuation, breeding waste, wickedness, woe, pauperism, taxa-

tion, corruption, and crime, and our one party of patriotic and moral principle, with a policy which defends it from domination by corrupt bosses and which insures it forever against the blighting control of saloon politics. We face with sorrow, shame, and fear the awful fact that this liquor traffic has a grip on our Government, municipal, State, and national, through the revenue system and saloon sovereignty, which no other party dares to dispute; a grip which dominates the party now in power, from caucus to Congress, from policeman to President, from the rum shop to the White House; a grip which compels the Chief Executive to consent that law shall be nullified in behalf of the brewer, that the canteen shall curse our army and spread intemperance across the seas, and that our flag shall wave as the symbol of partnership at home and abroad between this Government and the men who defy and defile it for their unholy gain.

"We charge upon President McKinley, who was elected to his high office by appeals to Christian sentiment and patriotism almost unprecedented and by a combination of moral influences never before seen in this country, that, by his conspicuous example as a wine drinker at public banquets and as a wine-serving host in the White House, he has done more to encourage the liquor business, to demoralize the temperance habits of young men, and to bring Christian practices and requirements into disrepute than any other President this republic has ever had. We further charge upon President McKinley responsibility for the army canteen, with all its dire brood of disease, immorality, sin, and death, in this country, in Cuba, in Porto Rico, and the Philippines; and we insist that by his attitude concerning the canteen and his apparent contempt for the vast number of petitions and petitioners protesting against it, he has outraged and insulted the moral sentiment of this country in such a manner and to such a degree as calls for its righteous uprising and his indignant and effective rebuke. We challenge denial of the fact that our Chief Executive, as commander in chief of the military forces of the United States, at any time prior to or since March 2, 1899, could have closed every army saloon, called a canteen, by executive order, as President Hayes in effect did before him, and should have closed them, for the same reason that actuated President Hayes.

"We deplore the fact that an administration of this republic, claiming the right and power to carry our flag across the seas and to conquer and annex new territory, should admit its lack of power to prohibit the American saloon on subjugated soil, or should openly confess itself subject to liquor sovereignty under that flag. We are humiliated, exasperated, and grieved by the evidence, painfully abundant, that this administration's policy of expansion is bearing so rapidly its first fruits of drunkenness, insanity, and crime under the hothouse sun of the tropics; and that when the president of the first Philippine Commission said, 'It was unfortunate that we introduced and established the saloon there, to corrupt the natives and to exhibit the vices of our race,' we charge the inhumanity and unchristianity of this act on the administration of William McKinley and upon the party which elected and would perpetuate the same. We declare that the only policy which the Government of the United States can of right uphold as to the liquor traffic under the national Constitution upon any territory under the military or civil control of that Government is the policy of prohibition; that 'to establish justice, insure domestic tranquillity, provide for the

common defense, promote the general welfare, and insure the blessings of liberty to ourselves and our posterity,' as the Constitution provides, the liquor traffic must neither be sanctioned nor tolerated, and that the revenue policy, which makes our Government a partner with distillers and brewers and barkeepers, is a disgrace to our civilization, an outrage upon humanity, and a crime against God. We condemn the present administration at Washington because it has repealed the prohibitory law in Alaska, and has given over the partly civilized tribes there to be the prey of the American grogshop, and because it has entered upon a license policy in our new possessions by incorporating the same in the revenue act of Congress in the code of laws for the government of the Hawaiian Islands. We call general attention to the fearful fact that exportation of liquors from the United States to the Philippine Islands increased from \$337 in 1898 to \$467,198 in the first ten months of the fiscal year ended June 30, 1900; and that while our exportations of liquor to Cuba never reached \$30,000 a year previous to American occupation of that island, our exports of such liquors to Cuba during the fiscal year of 1899 reached the sum of \$629,655."

The Democratic party assembled on July 4 in national convention at Kansas City, Mo., and on July 5 nominated William Jennings Bryan, of Nebraska, for President, by acclamation. Adlai E. Stevenson, of Illinois, was nominated for Vice-President by 559½ votes to 200 for David B. Hill, of New York, 80½ for C. A. Towne, of Minnesota, and 87, all but 2 of them, divided between A. W. Patrick, of Ohio, Julian S. Carr, of North Carolina, and John Walter Smith, of Maryland, who received the ballots of their State delegations. The platform adopted on the same day was as follows:

"We, the representatives of the Democratic party of the United States, assembled in convention on the anniversary of the adoption of the Declaration of Independence, do reaffirm our faith in that immortal proclamation of the inalienable rights of man, and our allegiance to the Constitution framed in harmony therewith by the fathers of the republic. We hold with the United States Supreme Court that the Declaration of Independence is the spirit of our Government, of which the Constitution is the form and letter.

"We declare again that all governments instituted among men derive their just powers from the consent of the governed; that any government not based upon the consent of the governed is a tyranny; and that to impose upon any people a government of force is to substitute the methods of imperialism for those of a republic. We hold that the Constitution follows the flag, and denounce the doctrine that an Executive or Congress, deriving their existence and their powers from the Constitution, can exercise lawful authority beyond it, for in violation of it we assert that no nation can long endure half republic and half empire, and we warn the American people that imperialism abroad will lead quickly and inevitably to despotism at home. Believing in these fundamental principles, we denounce the Porto Rico law, enacted by a Republican Congress against the protest and opposition of the Democratic minority, as a bold and open violation of the nation's organic law and a flagrant breach of the national good faith. It imposes upon the people of Porto Rico a government without their consent and taxation without representation. It dishonors the American people by repudiating a solemn pledge made in their behalf by the commanding general of our army, which the

Porto Ricans welcomed to a peaceful and unresisted occupation of their land. It doomed to poverty and distress a people whose helplessness appeals with peculiar force to our justice and magnanimity. In this, the first act of its imperialistic programme, the Republican party seeks to commit the United States to a colonial policy, inconsistent with republican institutions and condemned by the Supreme Court in numerous decisions. We demand the prompt and honest fulfillment of our pledge to the Cuban people and the world that the United States has no disposition nor intention to exercise sovereignty, jurisdiction, or control over the island of Cuba except for its pacification. The war ended nearly two years ago, profound peace reigns over all the island, and still the administration keeps the government of the island from its people, while Republican carpetbag officials plunder its revenue and exploit the colonial theory to the disgrace of the American people. We condemn and denounce the Philippine policy of the present administration. It has involved the republic in unnecessary war, sacrificed the lives of many of our noblest sons, and placed the United States, previously known and applauded throughout the world as the champion of freedom, in the false and un-American position of crushing with military force the efforts of our former allies to achieve liberty and self-government. The Filipinos can not be citizens without endangering our civilization; they can not be subjects without imperiling our form of government, and as we are not willing to surrender our civilization or to convert the republic into an empire, we favor an immediate declaration of the nation's purpose to give to the Filipinos first a stable form of government; second, independence; and third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America. The greedy commercialism which dictated the Philippine policy of the Republican administration attempts to justify it with the plea that it will pay, but even this sordid and unworthy plea fails when brought to the test of facts. The war of criminal aggression against the Filipinos, entailing an annual expense of many millions, has already cost more than any possible profit that could accrue from the entire Philippine trade for years to come. Furthermore, when trade is extended at the expense of liberty the price is always too high. We are not opposed to territorial expansion when it takes in desirable territory which can be erected into States in the Union, and whose people are willing and fit to become American citizens. We favor expansion by every peaceful and legitimate means. But we are unalterably opposed to the seizing or purchasing of distant islands, to be governed outside the Constitution, and whose people can never become citizens. We are in favor of extending the republic's influence among the nations, but believe that influence should be extended not by force and violence, but through the persuasive power of a high and honorable example. The importance of other questions now pending before the American people is in no wise diminished, and the Democratic party takes no backward step from its position on them, but the burning issue of imperialism growing out of the Spanish War involves the very existence of the republic and the destruction of our free institutions. We regard it as the paramount issue of the campaign. The declaration in the Republican platform adopted at the Philadelphia convention, held in June, 1900, that the Republican party 'steadfastly adheres to the policy announced in the Monroe doctrine,' is 'manifestly

insincere and deceptive. This profession is contradicted by the avowed policy of that party in opposition to the spirit of the Monroe doctrine to acquire and hold sovereignty over large areas of territory and large numbers of people in the Eastern Hemisphere. We insist on the strict maintenance of the Monroe doctrine, and in all its integrity, both in letter and in spirit, as necessary to prevent the extension of European authority on this continent and as essential to our supremacy in American affairs. At the same time we declare that no American people shall ever be held by force in subjection to European authority.

"We oppose militarism. It means conquest abroad and intimidation and oppression at home. It means the strong arm which has ever been fatal to free institutions. It is what millions of our citizens have fled from in Europe. It will impose upon our peace-loving people a large standing army, an unnecessary burden of taxation, and would be a constant menace to their liberties. A small standing army and a well-disciplined State militia are amply sufficient in time of peace. This republic has no place for a vast military establishment, a sure forerunner of compulsory military service and conscription. When the nation is in danger the volunteer soldier is his country's best defender. The National Guard of the United States should ever be cherished in the patriotic hearts of a free people. Such organizations are ever an element of strength and safety. For the first time in our history and coeval with the Philippine conquest has there been a wholesale departure from our time-honored and approved system of volunteer organization. We denounce it as un-American, undemocratic and unrepugnant, and as a subversion of the ancient and fixed principles of a free people.

"Private monopolies are indefensible and intolerable. They destroy competition, control the price of raw material and of the finished product, thus robbing both producer and consumer. They lessen the employment of labor and arbitrarily fix the terms and conditions thereof; and deprive individual energy and small capital of their opportunity for betterment. They are the most efficient means yet devised for appropriating the fruits of industry to the benefit of the few at the expense of the many, and, unless their insatiate greed is checked, all wealth will be aggregated in a few hands and the republic destroyed. The dishonest paltering with the trust evil by the Republican party in its State and national platforms is conclusive proof of the truth of the charge that trusts are the legitimate product of Republican policies, that they are fostered by Republican laws, and that they are protected by the Republican administration in return for campaign subscriptions and political support. We pledge the Democratic party to an unceasing warfare in nation, State, and city against private monopoly in every form. Existing laws against trusts must be enforced and more stringent ones must be enacted providing for publicity as to the affairs of corporations engaged in interstate commerce and requiring all corporations to show, before doing business outside of the State of their origin, that they have no water in their stock, and that they have not attempted and are not attempting to monopolize any branch of business or the production of any articles of merchandise; and the whole constitutional power of Congress over interstate commerce, the mails and all modes of interstate communication shall be exercised by the enactment of comprehensive laws upon the subject of trusts. Tariff laws should be amended by putting the products of trusts upon the free list, to prevent monopoly under the plea

of protection. The failure of the present Republican administration, with an absolute control over all the branches of the National Government, to enact any legislation designed to prevent or even curtail the absorbing power of trusts and illegal combinations, or to enforce the antitrust laws already on the statute books, proves the insincerity of the high-sounding phrases of the Republican platform. Corporations should be protected in all their rights and their legitimate interests should be respected, but any attempt by corporations to interfere with the public affairs of the people or to control the sovereignty which creates them should be forbidden under such penalties as will make such attempts impossible. We condemn the Dingley tariff law as a trust-breeding measure skillfully devised to give to the few favors which they do not deserve, and to place upon the many burdens which they should not bear. We favor such an enlargement of the scope of the interstate commerce law as will enable the commission to protect individuals and communities from discrimination and the public from unjust and unfair transportation rates.

"We reaffirm and indorse the principles of the national Democratic platform adopted at Chicago in 1896, and we reiterate the demand of that platform for an American financial system made by the American people for themselves, which shall restore and maintain a bimetallic price level, and as part of such system the immediate restoration of the free and unlimited coinage of silver and gold at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation. We denounce the currency bill enacted at the last session of Congress as a step forward in the Republican policy which aims to discredit the sovereign right of the National Government to issue all money, whether coin or paper, and to bestow upon national banks the power to issue and control the volume of paper money for their own benefit. A permanent national bank currency, secured by Government bonds, must have a permanent debt to rest upon, and, if the bank currency is to increase with population and business, the debt must also increase. The Republican currency scheme is, therefore, a scheme for fastening upon the taxpayers a perpetual and growing debt for the benefit of the banks. We are opposed to this private corporation paper circulated as money, but without legal tender qualities, and demand the retirement of national bank notes as fast as Government paper or silver certificates can be substituted for them. We favor an amendment to the Federal Constitution providing for the election of United States Senators by direct vote of the people, and we favor direct legislation wherever practicable. We are opposed to government by injunction; we denounce the blacklist, and favor arbitration as a means of settling disputes between corporations and their employees.

"In the interest of American labor and the upbuilding of the workingman as the corner stone of the prosperity of our country, we recommend that Congress create a Department of Labor, in charge of a secretary, with a seat in the Cabinet, believing that the elevation of the American laborer will bring with it increased production and increased prosperity to our country at home and to our commerce abroad. We are proud of the courage and fidelity of the American soldiers and sailors in all our wars; we favor liberal pensions to them and their dependents; and we reiterate the position taken in the Chicago platform in 1896, that the fact of enlistment and service shall be deemed conclusive evidence against disease and disability before enlistment.

" We favor the immediate construction, ownership, and control of the Nicaraguan Canal by the United States, and we denounce the insincerity of the plank in the Republican national platform for an isthmian canal, in the face of the failure of the Republican majority to pass the bill pending in Congress. We condemn the Hay-Pauncefote treaty as a surrender of American rights and interests, not to be tolerated by the American people. We denounce the failure of the Republican party to carry out its pledges to grant statehood to the Territories of Arizona, New Mexico, and Oklahoma, and we promise the people of those Territories immediate Statehood, and home rule during their condition as Territories; and we favor home rule and a territorial form of government for Alaska and Porto Rico. We favor an intelligent system of improving the arid lands of the West, storing the waters for the purposes of irrigation, and the holding of such lands for actual settlers. We favor the continuance and strict enforcement of the Chinese exclusion law and its application to the same classes of all Asiatic races.

" Jefferson said: 'Peace, commerce, and honest friendship with all nations, entangling alliances with none.' We approve this wholesome doctrine and earnestly protest against the Republican departure which has involved us in so-called world politics, including the diplomacy of Europe and the intrigue and land-grabbing in Asia, and we especially condemn the ill-concealed Republican alliance with England, which must discriminate against other friendly nations and which has already stifled the nation's voice while liberty is being strangled in Africa.* Believing in the principles of self-government and rejecting, as did our forefathers, the claims of monarchy, we view with indignation the purpose of England to overwhelm with force the South African republics. Speaking, as we believe, for the entire American nation, except its Republican officeholders, and for all free men everywhere, we extend our sympathy to the heroic burghers in their unequal struggle to maintain their liberty and independence.

" We denounce the lavish appropriations of recent Republican congresses, which have kept taxes high and which threaten the perpetuation of the oppressive war levies. We oppose the accumulation of a surplus to be squandered in such barefaced frauds upon the taxpayers as the shipping subsidy bill, which under the false pretense of fostering American shipbuilding, would put unearned millions into the pockets of favorite contributors to the Republican campaign fund. We favor the reduction and speedy repeal of the war taxes, and a return to the time-honored Democratic policy of strict economy in governmental expenditures.

" Believing that our most cherished institutions are in great peril, that the very existence of our constitutional republic is at stake, and that the decision now to be rendered will determine whether or not our children are to enjoy those blessed privileges of free government which have made the United States great, prosperous, and honored, we earnestly ask for the foregoing declaration of principles the hearty support of the liberty-loving American people, regardless of previous party affiliations."

The Silver Republican National Convention, held at Kansas City, Mo., on July 6, the day following the Democratic convention, accepted the nomination of William J. Bryan for President, and referred the nomination of a candidate for Vice-President to its national committee, which indorsed the nomination of Adlai E. Stevenson. The following platform was adopted:

" We, the Silver Republican party, in national

convention assembled, declare these as our principles and invite the co-operation of all who agree therewith: We recognize that the principles set forth in the Declaration of Independence are fundamental and everlastingly true in their applications of governments among men. We believe the patriotic words of Washington's farewell to be the words of soberness and wisdom, inspired by the spirit of right and truth. We treasure the words of Jefferson as priceless gems of American statesmanship. We hold in sacred remembrance the broad philanthropy and patriotism of Lincoln, who was the great interpreter of American history and the great apostle of human rights and of industrial freedom, and we declare, as was declared by the convention that nominated the great emancipator, that the maintenance of the principles promulgated in the Declaration of Independence and embodied in the Federal Constitution, 'that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness; that to secure these rights governments are instituted among men, deriving their just powers from the consent of the governed,' is essential to the preservation of our republican institutions. We declare our adherence to the principle of bimetallism as the right basis of a monetary system under our national Constitution, a principle that found place repeatedly in Republican platforms from the demonetization of silver in 1873 to the St. Louis Republican convention of 1896. Since that convention a Republican Congress and a Republican President, at the dictation of the trusts and money power, have passed and approved a currency bill which in itself is a repudiation of the doctrine of bimetallism advocated theretofore by the President and every great leader of his party. This currency law destroys the full money power of the silver dollar, provides for the payment of all Government obligations and the redemption of all forms of paper money in gold alone; retires the time-honored and patriotic greenbacks, constituting one sixth of the money in circulation, and surrenders to banking corporations a sovereign function of issuing all paper money, thus enabling these corporations to control the prices of labor and property by increasing or diminishing the volume of money in circulation, thus giving the banks power to create panics and bring disaster upon business enterprises. The provisions of this currency law making the bonded debt of the republic payable in gold alone change the contract between the Government and the bondholders to the advantage of the latter, and is in direct opposition to the declaration of the Matthews resolution passed by Congress in 1878, for which resolution the present Republican President, then a member of Congress, voted, as did also all leading Republicans, both in the House and Senate. We declare it to be our intention to lend our efforts to the repeal of this currency law, which not only repudiates the ancient and time-honored principles of the American people before the Constitution was adopted, but is violative of the principles of the Constitution itself, and we shall not cease our efforts until there has been established in its place a monetary system based upon the free and unlimited coinage of silver and gold into money at the present legal ratio of 16 to 1 by the independent action of the United States, under which system all paper money shall be issued by the Government and all such money coined or issued shall be a full legal tender in payment of all debts, public and private, without exception. We are in favor of a graduated tax upon incomes, and if necessary to accomplish this

we favor an amendment to the Constitution. We believe that United States Senators ought to be elected by direct vote of the people, and we favor such amendment of the Constitution and such legislation as may be necessary to that end. We favor the maintenance and the extension wherever practicable of the merit system in the public service, appointments to be made according to fitness, competitively ascertained, and public servants to be retained in office only so long as shall be compatible with the efficiency of the service. Combinations, trusts, and monopolies contrived and arranged for the purpose of controlling the prices and quantity of articles supplied to the public are unjust, unlawful, and oppressive. Not only do these unlawful conspiracies fix the prices of commodities in many cases, but they invade every branch of the State and National Government with their polluting influence and control the actions of their employees and dependents in private life until their influence actually imperils society and the liberty of the citizen. We declare against them. We demand the most stringent laws for their destruction and the most severe punishment of their promoters and maintainers and the energetic enforcement of such laws by the courts. We believe the Monroe doctrine to be sound in principle and a wise national policy, and we demand a firm adherence thereto. We condemn acts inconsistent with it and that tend to make us parties to the interests and to involve us in the controversies of European nations and to recognition by pending treaty of the right of England to be considered in the construction of an interoceanic canal. We declare that such canal, when constructed, ought to be controlled by the United States in the interests of American nations. We observe with anxiety and regard with disapproval the increasing ownership of American lands by aliens and their growing control over our international transportation, natural resources, and public utilities. We demand legislation to protect our public domain, our natural resources, our franchises, and our internal commerce, and to keep them free and maintain their independence of all foreign monopolies, institutions, and influences, and we declare our opposition to the leasing of the public lands of the United States whereby corporations and syndicates will be able to secure control thereof and thus monopolize the public domain, the heritage of the people. We are in favor of the principles of direct legislation. In view of the great sacrifice made and patriotic services rendered we are in favor of liberal pensions to deserving soldiers, their widows, orphans, and other dependents. We believe that enlistment and service should be accepted as conclusive proof that the soldier was free from disease and disability at the time of his enlistment. We condemn the present administration of the pension laws. We tender to the patriotic people of the South African republics our sympathy, and express our admiration for them in their heroic struggle to preserve their political freedom and maintain their national existence. We declare the destruction of these republics and the subjugation of their people to be a crime against civilization. We believe this sympathy should have been voiced by the American Congress, as was done in the case of the French, Greeks, Hungarians, Poles, Armenians, and the Cubans, and as the traditions of this country would have dictated. We declare the Porto Rican tariff law to be not only a serious but a dangerous departure from the principles of our form of government. We believe in the republican form of government; and we are opposed to monarchy, and to the whole theory of imperialistic

control. We believe in self-government, a government by the consent of the governed; and are unalterably opposed to a government based upon force. It is incontrovertible that the inhabitants of the Philippine archipelago can not be made citizens of the United States without endangering our civilization. We are therefore in favor of applying to the Philippines the principle we are solemnly and publicly pledged to observe in the case of Cuba. We demand that our nation's promise to Cuba shall be fulfilled in every particular. There being no longer any necessity for collecting war taxes, we demand relief from the taxes levied to carry on the war with Spain. We favor the immediate admission into the Union of States of the Territories of Arizona, New Mexico, and Oklahoma. We believe the National Government should lend encouragement and assistance toward the reclamation of the arid lands of the United States; and to that end, we are in favor of a comprehensive survey thereof, and an immediate ascertainment of the water supply available for such reclamation, and we believe it to be the duty of the General Government to provide for the construction of storage reservoirs and irrigation works so that the water supply of the arid region may be utilized to the greatest possible extent in the interest of the people, while preserving all rights of the States. Transportation is a public necessity, and the means and methods of it are matters of public concern. Transportation companies exercise an unwarranted power over industries, business, and commerce, and should be made to serve the public interests without making unreasonable charges or unjust discriminations. We observe with satisfaction the growing sentiment among the people in favor of the public ownership and operation of public utilities. We are in favor of expanding our commerce in the interest of American labor and for the benefit of all our people by every honest and peaceful means. We are opposed to the importation of Asiatic laborers in competition with American labor; and favor a more rigid enforcement of the laws relating thereto. Our creed and our history justify the nations of the earth in expecting that, wherever the American flag is unfurled in authority, there human liberty and political freedom shall be found. We protest against the adoption of any policy that will change, in the thought of the world, the meaning of our flag. We insist that it shall never float over any ship or wave at the head of any column directed against the political independence of any people of any race or in any clime. The Silver Republican party of the United States, in the foregoing principles, seeks to perpetuate the spirit, and to adhere to the teachings of Abraham Lincoln."

The national committee of the Gold Democracy adopted the following resolutions at Indianapolis on July 25:

"Resolved, That in the opinion of this committee the nomination of candidates by the national Democratic party for the offices of President and Vice-President is unwise and inexpedient.

"Second, that we reaffirm the Indianapolis platform of 1896.

"Third, we recommend the State committees in their respective States to preserve their organizations and take such steps as in their opinion may best subserve the principles of our party, especially in the maintenance of a sound currency, the right of private contract, the independence of the judiciary, and the authority of the President to enforce Federal laws, a covert attack on which is made under the guise of the denunciation of government by injunction.

"We urge the voters not to be deceived by the plea that the money question has been finally settled. The specific reiteration of the demand for the free coinage of silver at the ratio of 16 to 1 by the Kansas City convention and the history known of all men in connection therewith emphasize the danger of this demand. We indorse the action of Congress in passing a bill embodying the gold standard as a step in the right direction. We feel it would be dangerous to elevate to executive power any one hostile to the maintenance and enforcement of this law."

A convention of the Anti-Imperialist League met in Indianapolis, Ind., approved the nomination of William J. Bryan for the presidency, and on Aug. 16 adopted the following platform:

"This Liberty Congress of Anti-Imperialists recognizes a great national crisis which menaces the republic, upon whose future depends in such large measure the hope of freedom throughout the world. For the first time in our country's history the President has undertaken to subjugate a foreign people and to rule them by despotic power. He has thrown the protection of the flag over slavery and polygamy in the Sulu Islands. He has arrogated to himself the power to impose upon the inhabitants of the Philippines government without their consent and taxation without representation. He is waging war upon them for asserting the very principles for the maintenance of which our forefathers pledged their lives, their fortunes, and their sacred honor. He claims for himself and Congress authority to govern the Territories of the United States without constitutional restraint.

"We believe in the Declaration of Independence. Its truths, not less self-evident to-day than when first announced by our fathers, are of universal application, and can not be abandoned while government by the people endures. We believe in the Constitution of the United States. It gives the President and Congress certain limited powers, and secures to every man within the jurisdiction of our Government certain essential rights. We deny that either the President or Congress can govern any person anywhere outside the Constitution. We are absolutely opposed to the policy of President McKinley which proposes to govern millions of men without their consent, which in Porto Rico establishes taxation without representation and government by the arbitrary will of a Legislature unfettered by constitutional restraint, and in the Philippines prosecutes a war of conquest, and demands unconditional surrender from a people who are of right free and independent. The struggle of men for freedom has ever been a struggle for constitutional liberty. There is no liberty if the citizen has no right which the Legislature may not invade, if he may be taxed by the Legislature in which he is not represented, or if he is not protected by fundamental law against the arbitrary action of executive power. The policy of the President offers the inhabitants of Porto Rico, Hawaii, and the Philippines no hope of independence, no prospect of American citizenship, no constitutional protection, no representation in the Congress which taxes them. This is the government of men by arbitrary power without their consent; this is imperialism. There is no room under the free flag of America for subjects. The President and Congress, who derive all their powers from the Constitution, can govern no man without regard to its limitations. We believe the greatest safeguard of liberty is a free press, and we demand that the censorship in the Philippines, which keeps from the American people the knowledge of what is done in their name,

be abolished. We are entitled to know the truth, and we insist that the powers which the President holds in trust for us shall be not used to suppress it. Because we thus believe we oppose the re-election of Mr. McKinley. The supreme purpose of the people in this momentous campaign should be to stamp with their final disapproval his attempt to grasp imperial power. A self-governing people can have no more imperative duty than to drive from public life a Chief Magistrate who, whether in weakness or of wicked purpose, has used his temporary authority to subvert the character of their Government and to destroy their national ideals. We, therefore, in the belief that it is essential at this crisis for the American people again to declare their faith in the universal application of the Declaration of Independence and to reassert their will that their servants shall not have or exercise any powers whatever other than those conferred by the Constitution, earnestly make the following recommendations to our countrymen:

"First, that, without regard to their views on minor questions of domestic policy, they withhold their votes from Mr. McKinley, in order to stamp with their disapproval what he has done. Second, that they vote for those candidates for Congress in their respective districts who will oppose the policy of imperialism. Third, while we welcome any other method of opposing the re-election of Mr. McKinley, we advise direct support of Mr. Bryan as the most effective means of crushing imperialism.

"We are convinced of Mr. Bryan's sincerity and of his earnest purpose to secure to the Filipinos their independence. His position and the declarations contained in the platform of his party on the vital issue of the campaign meet our unqualified approval. We recommend that the executive committees of the American Anti-Imperialist League and its allied leagues continue and extend their organizations, preserving the independence of the movement, and that they take the most active possible part in the pending political campaign. Until now the policy which has turned the Filipinos from warm friends to bitter enemies, which has slaughtered thousands of them and laid waste their country, has been the policy of the President. After the next election it becomes the policy of every man who votes to re-elect him, and who thus becomes with him responsible for every drop of blood thereafter shed. Resolved, that in declaring that the principles of the Declaration of Independence apply to all men, this Congress means to include the negro race in America as well as the Filipinos. We deprecate all efforts, whether in the South or in the North, to deprive the negro of his rights as a citizen under the Declaration of Independence and the Constitution of the United States."

About one hundred volunteer delegates from several States met in Carnegie Hall, New York city, Sept. 5, and nominated Senator Donelson Caffery, of Louisiana, for President, and Archibald Murray Howe, of Cambridge, Mass., for Vice-President. The Committee on Platform, composed of Prof. Francis P. Nash, of Hobart College; Louis D. Lacroix, of Oxford, N. C.; Prof. Edward G. Bourne, of Yale; W. F. Lloyd, of New York city; and Edward Waldo Emerson, of Concord, Mass., presented the following platform, which was adopted:

"We, citizens of the United States of America, assembled for the purpose of defending the wise and conservative principles which underlie our Government, thus declare our aims and purposes: We find our country threatened with alternative

perils. On the one hand is a public opinion misled by organized forces of commercialism that have perverted a war intended by the people to be a war of humanity into a war of conquest. On the other is a public opinion swayed by demagogic appeals to factional and class passions, the most fatal of diseases to a republic. We believe that either of these influences, if unchecked, would ultimately compass the downfall of our country, but we also believe that neither represents the sober conviction of our countrymen. Convinced that the extension of the jurisdiction of the United States for the purpose of holding foreign people as colonial dependents is an innovation dangerous to our liberties and repugnant to the principles upon which our Government is founded, we pledge our earnest efforts through all constitutional means, first, to procure the renunciation of all imperial or colonial pretensions with regard to foreign countries claimed to have been acquired through or in consequence of military or naval operations of the last two years. Second, we further pledge our efforts to secure a single gold standard and a sound banking system. Third, to secure a public service based on merit only. Fourth, to secure the abolition of all corrupting special privileges, whether under the guise of subsidies, bounties, undeserved pensions or trust-breeding tariffs."

Senator Caffery and Mr. Howe declined on Sept. 21, and on Sept. 26 it was decided to make no other nominations.

The presidential election took place on Nov. 6. The total popular vote was 13,970,300. McKinley received a majority of 443,054 of all the votes cast. His plurality over Bryan was 832,280. In the electoral colleges his majority was 137. The

table above gives the popular vote for the various candidates—Republican, Democratic, Prohibitionist, Social-Democrat, Socialist-Labor, Middle-of-the-Road Populist, Union Reform, and United Christian—in the several States, the Republican or Democratic plurality in each State and the electoral vote cast in each State for McKinley or Bryan.

The Alaska Boundary.—The *modus vivendi* arranged with Great Britain on Oct. 20, 1899, called for the marking of certain provisional boundary points for convenience of administration around the head of Lynn Canal. It was stipulated that the citizens or subjects of either power found by the arrangement within the temporary jurisdiction of the other shall suffer no diminution of the rights or privileges that they have hitherto enjoyed. The Dominion of Canada made rules and regulations to secure to American miners and others transferred to Canadian jurisdiction all property and other rights that they possessed under American laws. The demarcation of the temporary boundary was completed by a joint survey in July, 1900. Canada, on the theory that in the conventional boundary 10 marine leagues inland the continental coast line is to be followed, leaping from headland to headland, claimed control of all water access to the Klondike gold fields by the Dalton trail, White pass, and Chilkoot pass, control of all the Lynn Canal, and also of Skagway and Dyea. The desire of the Canadian Government was to get a deep-water harbor and port of entry, and it offered to surrender its claim to Dyea and Skagway if the United States would concede to it Pyramid harbor. When this was refused Canada proposed

arbitration, to which the United States would not agree, as it would imply an admission that its contention that the coast line mentioned in the treaty follows the sinuosities of the coast admitted of doubt and would probably result in a compromise line. Before a *modus vivendi* was arranged Canadian mounted police were in Dyea and Skagway, and a Canadian Government office was established in one of those places. The United States sent troops to both towns, and both governments attempted to exercise jurisdiction. Disputes arose constantly, and the legal tenure of mining lands was subject to doubt. The provisional boundary leaves these places and the head of navigation within the jurisdiction of the United States. The line leaves in American control also the Indian village of Klukwan, on Chilkoot river, although it is about 10 miles within the boundary claimed by the United States. The boundary commissioners placed monuments at the points along the line where access can be had to the interior—at White pass, Chilkoot pass, on the Klehini river, and on Porcupine creek. The boundary of Alaska where it follows the meridian of 141° west of Greenwich has been surveyed independently by United States and Canadian officers by sidereal observations, and the results at several points show discrepancies in no place exceeding 700 feet. A convention was concluded with Great Britain in 1898 for a joint survey on which the Senate failed to take action, and in 1900 negotiations were opened by the Department of State for a new convention to provide for a joint determination of the meridian by telegraphic observations.

The Interoceanic Canal.—Secretary Hay and Lord Pauncefote on Feb. 5, 1900, signed at Washington a convention to take the place of the articles concerning the projected isthmian canal that are contained in the Clayton-Bulwer treaty, ratified in 1850. In that treaty it was stipulated that neither the United States nor Great Britain shall obtain or maintain for itself any exclusive control over a ship canal. In the new convention this provision was abrogated, and Great Britain conceded to the United States the right to build and maintain such a canal, and the United States undertook to maintain the neutrality of the proposed canal and keep it perpetually open to the ships of all nations in peace and war. The treaty was not ratified by the Senate in its original form, but with amendments, and negotiations were begun in December to secure its acceptance by Great Britain in its amended form. The text as amended is as follows:

"ARTICLE I. It is agreed that the canal may be constructed under the auspices of the Government of the United States, either directly at its own cost or by gift or loan of money to individuals or corporations or through subscriptions to or purchase of stock or shares, and that, subject to the provisions of the present convention, the said government shall have and enjoy all the rights incident to such construction as well as the exclusive right of providing for the regulation and management of the canal.

"ART. II. The high contracting parties, desiring to preserve and maintain the 'great principle' of neutralization established in Article VIII of the Clayton-Bulwer convention, which convention is hereby superseded, adopt as the basis of such neutralization the following rules substantially as embodied in the convention between Great Britain and certain other powers signed at Constantinople Oct. 28, 1888, for the free navigation of the Suez maritime canal—that is to say:

"First, the canal shall be free and open in time of war as in time of peace to vessels of

commerce and of war of all nations on terms of entire equality, so that there shall be no discrimination against any nation or its citizens or subjects in respect of the conditions or charges of traffic or otherwise.

"Second, the canal shall never be blockaded, nor shall any right of war be exercised nor any act of hostility be committed within it.

"Third, vessels of war of a belligerent shall not revictual nor take any stores in the canal except so far as may be strictly necessary, and the transit of such vessels through the canal shall be effected with the least possible delay in accordance with the regulations in force and with only such intermission as may result from the necessities of the service. Prizes shall be in all respects subject to the same rules as vessels of war of the belligerents.

"Fourth, no belligerent shall embark or disembark troops, munitions of war, or warlike materials in the canal except in case of accidental hindrance of the transit, and in such case the transit shall be resumed with all possible dispatch.

"Fifth, the provisions of this article shall apply to waters adjacent to the canal, within three marine miles of either end. Vessels of war of a belligerent shall not remain in such waters longer than twenty-four hours at any one time except in case of distress, and in such case shall depart as soon as possible; but a vessel of war of one belligerent shall not depart within twenty-four hours from the departure of a vessel of war of the other belligerent.

"It is agreed, however, that none of the immediately foregoing conditions and stipulations in sections numbered 1, 2, 3, 4, and 5 of this article shall apply to measures which the United States may find it necessary to take for securing by its own forces the defense of the United States and the maintenance of public order.

"Sixth, the plant, establishments, buildings, and all works necessary to the construction, maintenance, and operation of the canal shall be deemed to be part thereof for the purposes of this convention, and in time of war, as in time of peace, shall enjoy complete immunity from attack or injury by belligerents and from acts calculated to impair their usefulness as part of the canal.

"Seventh, no fortifications shall be erected commanding the canal or the waters adjacent. The United States, however, shall be at liberty to maintain such military police along the canal as may be necessary to protect it against lawlessness and disorder."

The contract of the Maritime Canal Company, which undertook to construct a canal by piercing the Isthmus of Nicaragua, was declared forfeit by the Nicaraguan Government for nonexecution in October, 1899. That Government refused to reopen the question of the forfeiture, and subsequently declared the Eyre-Cragin option void also for nonpayment of the stipulated advance. Deeming itself relieved from all existing engagements, the Nicaraguan Government showed a disposition to deal freely with the canal question either by entering into arrangements with the United States or by taking independent measures to promote the construction of the water way. A proposed agreement, conditional on the abrogation of the obligations of the United States toward Great Britain under the Clayton-Bulwer treaty, gives to the United States the absolute right to build and operate and to police the canal.

The Supreme Court.—The Supreme Court is composed as follows: Chief Justice, Melville W. Fuller, of Illinois, appointed in 1888. Associate

Justices, John M. Harlan, of Kentucky, appointed in 1877; Horace Gray, of Massachusetts, appointed in 1881; David J. Brewer, of Kansas, appointed in 1889; Henry B. Brown, of Michigan, appointed in 1890; George Shiras, Jr., of Pennsylvania, appointed in 1892; Edward D. White, of Louisiana, appointed in 1894; Rufus W. Peckham, of New York, appointed in 1895; and Joseph McKenna, of California, appointed in 1897.

At the close of the October term, 1898, 308 cases were not disposed of. The number of cases docketed at the October term, 1899, was 384, and 375 cases were disposed of during the term. The number actually considered by the court was 328, of which 174 were argued orally and 154 submitted on printed arguments.

Some of the more important cases decided were as follow:

The Texas Antitrust Law.—In *Waters-Pierce Oil Company vs. Texas*, decided March 19, 1900, the court held as follows: It is well settled that a State has the power to impose such conditions as it pleases upon foreign corporations seeking to do business within it. The statute of Texas of March 30, 1890, prohibiting foreign corporations that violated the provisions of that act from doing any business within the State, imposed conditions which it was within the power of the State to impose.

Texas vs. Houston and Texas Central Railroad Company.—This was a suit brought by the State of Texas to recover \$673,000 from the Houston and Texas Central Railroad Company for loans from the school fund of the State prior to the civil war, which the company claimed to have paid. The payments were made by the company in Treasury warrants issued by the State under authority of acts passed in 1863 and 1864. The State officials declared that the payments were void on account of having been made in warrants issued in violation of the provision of the Constitution that no State should emit bills of credit; that they were in violation of the provision of the Texas Constitution, which forbade the issue of warrants to circulate as money, and that they were issued in aid of the rebellion, and therefore illegal. The State courts sustained the State officials in all except the contention that the warrants were issued in aid of the rebellion. The Supreme Court decided that the warrants were not issued in violation of the Federal and State Constitutions, and that the payments of the railroad company were valid. Mr. Justice Brown, concurring in the judgment of the court, dissented from that part which held the warrants were not bills of credit and used as money. But it was too late now, he said, for the State to repudiate them. To do so would be a plain violation of public faith.

The Bankruptcy Law.—The case of *Bardes vs. the Hawarden Bank* involved the question of jurisdiction of the United States district court under the present bankruptcy law. The court held that the provisions of the second clause of section 23 of the bankrupt act of 1898 control and limit the jurisdiction of all courts, including the several district courts of the United States, over suits brought by trustees in bankruptcy to recover or collect debts due from third parties or to set aside transfers of property to third parties, alleged to be fraudulent as against creditors, including payments in money or property to preferred creditors.

The Minnesota Railroad Law.—In the *Wisconsin, Minnesota and Pacific Railroad Company vs. Jacob F. Jacobson*, the opinion of the State court was affirmed, upholding the law. The case involves the validity of the Minnesota State law requiring intersecting railroad lines crossing each

other at grade to make "Ys" connecting the two. The law was attacked upon the ground that it is a violation of the interstate commerce clause of the Constitution. Justices White and McKenna joined in a dissenting opinion. Justice White said the opinion was far reaching in its effect, and amounted to saying that private property might be taken for public use without any compensation whatever.

Governorship of Kentucky.—Taylor and Marshall *vs. Beckham* was decided May 21, 1900. This was an action in the nature of *quo warranto*, brought under the statutes of Kentucky by J. C. W. Beckham against William S. Taylor and John Marshall for usurpation of the offices of Governor and Lieutenant Governor of Kentucky. The determination of contests of the election of Governor and Lieutenant Governor in that State is committed to the General Assembly. The court dismissed the writ of error and declined to take jurisdiction. The Chief Justice in delivering the opinion quoted from the decision of the court in *Luther vs. Borden* as follows: "The high power has been conferred on this court of passing judgment upon the acts of the State sovereignties, and of the legislative and executive branches of the Federal Government, and of determining whether they are beyond the limits of power marked out for them respectively by the Constitution of the United States. This tribunal, therefore, should be the last to overstep the boundaries which limit its own jurisdiction. And while it should always be ready to meet any question confided to it by the Constitution, it is equally its duty not to pass beyond its appropriate sphere of action, and to take care not to involve itself in discussions which properly belong to other forums."

Insurance.—*New York Life Insurance Company vs. Cravens.* The contract for life insurance in this case, made by a New York insurance company in the State of Missouri with a citizen of that State, is subject to the laws of that State regulating life insurance policies, although the policy declares "that the entire contract contained in the said policy and in this application, taken together, shall be construed and interpreted as a whole and in each of its parts and obligations according to the laws of the State of New York, the place of the contract being expressly agreed to be the principal office of the said company in the city of New York." The power of a State over foreign corporations is not less than the power of a State over domestic corporations.

Legacy Tax Cases.—*Knowlton vs. Moore* was decided May 14, 1900. The contention was that the legacy tax was unconstitutional, on the following grounds: That it constitutes a direct tax; that it is not uniform for the reason that it exempts from its operation legacies under the value of \$10,000, and because it provides for a progressive tax, and is invalid on other grounds of inequality and want of uniformity, and that the right of inheritance is a privilege or franchise within the exclusive power of the State to grant and regulate, and not subject to abridgment or taxation by the General Government. Another point involved was, that the tax does not attach to any individual legacy unless such legacy exceeds the sum of \$10,000. The decision, delivered by Justice White, sustained the constitutionality of the law, holding that the tax was not a direct tax within the meaning of the Constitution, but, on the contrary, a duty or excise. The uniformity clause of the Constitution was held to relate only to geographical uniformity. It was decided that legacies not exceeding \$10,000 were not taxable,

and that the rate of tax was progressively increased by the amount of each separate legacy or distributive share, and not by the whole amount of the personal estate of the deceased from which the legacies or distributive shares were derived.

In *Plummer vs. Coler* the question involved was whether, under the inheritance-tax laws of a State, a tax may be validly imposed on a legacy consisting of United States bonds, issued under a statute declaring them to be exempt from State taxation in any form. It was held that the right to take property by will or descent is derived from and regulated by municipal law, and in assessing a tax upon such right or privilege the State may lawfully measure or fix the amount of the tax by referring to the value of the property passing; and the incidental fact that such property is composed, in whole or in part, of Federal securities, does not invalidate the State tax or the law under which it is imposed.

In the cases of *Murdock, executor, vs. Ward*, collector, and *Sherman vs. the United States*, it was held that legacies consisting of United States bonds were subject to the United States legacy tax.

Tax on Express Packages.—The cases of the *American Express Company vs. Michigan* and *Crawford vs. Hubbell*, treasurer of Adams Express Company, involved the question whether the shipper or the carrier shall pay for the stamp which the war revenue act requires on receipts of goods accepted for carriage and transportation. The cases arose from an effort to compel express companies to accept packages for transportation without requiring the shipper to provide or pay for a revenue stamp in addition to the usual or ordinary charges that existed before July 1, 1898, when the act went into effect. The court held that express companies are not forbidden to shift the burden of the stamp tax by an increase of rates which are not unreasonable.

Chinese Certificates.—In *United States vs. Mrs. Gue Lim* the question was raised whether a wife, or minor children, of Chinese merchants who are already domiciled in this country may enter the United States without the certificates prescribed by section 6 of the act of July 5, 1884. The court held that a certificate is not necessary in either case.

Removal from Office.—In *Keim vs. United States*, decided April 9, 1900, it was held that the courts have no general supervising power over the action of the executive departments of the Government in discharging one of the clerks therein, and that the power of removal from office is incident to the power of appointment.

War Prize Cases.—The court decided several prize cases, among them the following: The *Panama* sailed from New York for Havana with a general cargo on April 20, 1898, and was captured on the 25th while approaching Havana. She was condemned in the court below, on the ground that, since by the act of Congress of April 25, 1898, and by the Executive proclamation on the succeeding day, it was determined that the war with Spain began on April 21, including that day, all Spanish property afloat captured from that time became liable to condemnation, and that this vessel was not exempt under any provision of the Executive proclamation. The majority of the Supreme Court affirmed the condemnation and found that the *Panama* was not entitled to the exemption of Article IV of the proclamation because, being under a contract with the Spanish Government, which attached her provisionally to the naval reserve, she carried an armament susceptible of use for hostile purposes, and was liable, upon arrival at the enemy's port of destination, to be

appropriated for such purposes. No general rule of international law exempts mail ships from capture as prize of war.

The *Adula*, decided Feb. 26, 1900, was a British steamer owned by the Atlas Steamship Company, of Kingston, Jamaica, leased to a Spanish citizen for carrying refugees from Guantanamo, Cuba. The vessel was captured June 29, 1898, when entering Guantanamo Bay, and was condemned as a prize vessel. The court held that Admiral Sampson's blockade was effective; that the purpose of the voyage was pecuniary and not charitable, and that the vessel was a lawful prize. If a master has actual notice of a blockade, he is not at liberty even to approach the blockaded port for the purpose of making inquiries. If a neutral vessel be chartered to an enemy, she becomes to a certain extent and *pro hac vice* an enemy's vessel, and a notice to her charterer of the existence of a blockade is a notice to the vessel. Justices Shiras, Gray, White, and Peckham dissented.

The *Benito Estenger* was decided March 5. This was a Spanish vessel, but was sailing under the English flag after transfer from the Spanish owner to the neutral, and was captured off Cape Cruz, on the south coast of Cuba. She was condemned in the court below, and that condemnation was affirmed by the Supreme Court, three justices dissenting. The transfer to the neutral was found to be merely colorable. The former, or rather the real owner, a Cuban subject of Spain, declared that he was an adherent of the insurgent cause, and therefore an ally of the United States rather than a loyal subject of Spain. The court applied the general doctrine that in time of war citizens or subjects of the belligerents are enemies to each other, without regard to individual sentiments or dispositions, and that political status determines the question of enemy ownership.

The *Carlos F. Roses*, decided May 14, was a Spanish bark, and was proceeding from Montevideo to Havana, with a cargo of jerked beef and garlic. She was captured in the Bahama Channel by the cruiser *New York*, and was duly condemned as enemy property. Neutral bankers claimed the cargo, on the ground that they had made advances upon the security of the bills of lading indorsed in blank, and were wholly unindemnified except through insurers, who would be subrogated to their own rights. The majority of the Supreme Court found that the transactions, so far as they were shown, presented evidence of an enemy interest which called upon the asserted neutral owners to prove beyond question their right and title, which they had not sufficiently done within the rules established by the authorities. The court adverted to the fact that provisions, by the modern law of nations, may become contraband, although belonging to a neutral, on account of the particular situation of the war or on account of their destination, as for military use at ports of naval or military equipment.

Dewey's Bounty Claims.—*Dewey vs. the United States*. The original suit was brought in the Court of Claims to recover bounty money earned by the commanding officer of the American fleet at the battle of Manila, on May 1, 1898. In fixing the amount of the bounty it was necessary to determine whether the Spanish vessels engaged at Manila were of superior or inferior force to the American fleet, and to determine, as matter of law, whether, in determining the relative strength of the two fleets, the land batteries and mines and torpedoes of the Spanish should be taken into consideration in arriving at the strength of the Spanish fleet. The Court of Claims held that the land batteries and mines and torpedoes should not be considered

in determining the question, whether the Spanish forces were of superior or inferior force, and found the fleet to be inferior to the American vessels. The Supreme Court affirmed this judgment. Chief-Justice Fuller delivered a dissenting opinion, contending for a liberal construction of the statute, in which Justices White and McKenna joined.

The Constitution of Utah.—In *Maxwell vs. Dow* the court decided that the provisions of the Constitution of the State of Utah allowing proceedings in criminal cases to be prosecuted upon the process of "information," and limiting juries in certain cases to 8 persons instead of requiring the common law jury of 12, were not in contravention of the Federal Constitution. The decision fully explained what are the privileges and immunities of a citizen of the United States which no State can abridge. Justice Harlan dissented, saying that under this decision, if he did not misapprehend its effect, the Constitution did not stand in the way of any State striking down guarantees of life and liberty which English-speaking peoples have for centuries regarded as vital to personal security.

Jim Crow Cars.—The case of the Chesapeake and Ohio Railway Company vs. Kentucky was decided Dec. 3. It involved the question of the constitutionality of the Kentucky State law providing separate coaches for colored passengers. The opinion sustained the validity of the act. Justice Harlan dissented, holding that the law was an interference with interstate commerce, and that the Kentucky Legislature had no right to classify citizens by color in railway coaches.

Restraint on Commerce.—Cleveland, Cincinnati, Chicago and St. Louis Railway Company vs. Illinois involved the constitutionality of the State law of Illinois requiring all trains to stop at county seats in the State. As it appeared that the company furnished four regular passenger trains each way, sufficient to accommodate all local and through business, and that all such trains stopped at county seats, the act was held to be invalid as applied to an express train intended only for through passengers from St. Louis to New York. While railways are bound to provide adequately for the accommodation of those to whom they are directly tributary, they have the legal right, after all these local conditions have been met, to adopt special provisions for through traffic, and legislative interference therewith is an infringement on the constitutional requirement that commerce between the States shall be absolutely free and unobstructed.

Cigarettes.—*Austin vs. State of Tennessee* involved the constitutionality of the Tennessee law which forbids the sale or importation for sale of cigarettes. The case grew out of the importation of cigarettes into Tennessee from North Carolina, the packages being shipped in open baskets. The Tennessee dealers claimed the right to sell the separate packages, under the decision of the Supreme Court made several years ago, that no State can restrain the sale of an original package of an article of interstate commerce without encroaching upon the exclusive right of Congress to regulate commerce between the States. The Supreme Court affirmed that portion of the decision of the court of Tennessee which held that the sale of cigarettes involved in this case was not of an original package, but did not affirm that part of the decision holding that cigarettes are not legitimate articles of commerce. The Supreme Court did not undertake to define what is an original package further than to hold that the ordinary package of 10 or 20 cigarettes, such as is retailed to smokers, is not an original package. Four justices dissented.

UNITED STATES, FINANCES OF THE.
Notwithstanding the extraordinary military expenses incurred in the pacification of the Philippine Islands and the increase of the navy, the excess of the revenues of the Government for the fiscal year ending June 30, 1900, over the expenditures for the same period was \$79,527,060. There was an increase in receipts of internal revenue of \$21,890,765; of customs, \$27,036,389; and from the postal service, \$8,460,297. For the same period there was a decrease in the expenses of the military establishment of the Government as follows: The pay department of the army, \$37,637,023; the quartermaster's department, \$33,548,260; the medical department, \$8,605,738. There was also a decrease in the expenditures of the State Department of \$20,000,000 on account of foreign intercourse, that being the amount paid to Spain the previous year on account of the treaty obligation. The only notable increase of expenditures was \$4,121,037 for an increase of the navy.

The table on page 726 shows in detail the items of receipts and expenditures by the Government for the past fiscal year, compared with like items of the previous year.

The surplus arising from these operations was applied in part to the redemption of the \$25,364,500 outstanding 2-per-cent. bonds of the Government, and to paying a premium of \$33,147,055 on 3-, 4-, and 5-per-cent. bonds exchanged for 2-per-cent. bonds, as authorized by the act of March 14, 1900. This premium is in effect the anticipation of interest on the public debt to its amount, and in the end will be a net saving to the Government of about \$6,000,000. Considering the favorable relation of receipts to expenditures and its probable continuance and the large available balance of cash, recommendation is made by the Secretary of the Treasury for a moderate reduction of the war taxes.

The act of March 14, 1890, above referred to, authorized the funding of certain 3-, 4-, and 5-per-cent. bonds into 2-per-cent. gold bonds payable at the pleasure of the Government after thirty years from their issue, the outstanding bonds to be received in exchange therefor at a value not greater than their present worth to yield an income of 2½ per cent. per annum. The new bonds were authorized to be received by the Government from national banks, and bank notes to be issued thereon to the par value of the bonds deposited. Under this authority new national banks were organized throughout the country, which took out circulation, and existing banks largely converted their bonds deposited for circulation into the new bonds, that they might secure the issue of notes on the more favorable terms offered.

OBLIGATIONS.	Interest rate.	OUTSTANDING DEC. 31,	
		1900.	1899.
Consols of 1890	3	\$419,679,750
Loan of 1908-'18	3	104,900,040	\$198,679,000
Funded loan of 1907	4	287,578,100	545,366,550

be standard of value, and that all forms of money issued or coined by the United States shall be maintained at a parity of value with this standard, and imposes upon the Secretary of the Treasury the duty of maintaining such parity. To that end the act authorizes redemption in gold of the United States notes (greenbacks) and the Treasury notes issued under the act of July 14, 1890, when presented for that purpose, and to secure such redemption authorizes \$150,000,000 of gold in the Treasury to be set apart as a reserve to meet such redemptions and to be used for no other purpose: and when notes are redeemed from the fund, the Secretary of the Treasury is required to restore the reserve, first, by exchanging the notes for gold in the general Treasury; second, by exchanging the notes for gold deposits; and, third, by purchasing gold therewith. If these measures fail, 3-per-cent. bonds may be issued for gold as necessary to maintain the fund. The notes so redeemed may be paid out as above stated for gold, also for purchase of bonds, or for any

other lawful purpose except to meet deficiencies in the current revenues. Up to Oct. 1 the total redemptions in gold from the new reserve fund were \$22,530,854 in United States notes and \$3,594,708 in Treasury notes, for which the fund has been reimbursed from the general Treasury.

The following table shows the amount of money in circulation Jan. 1, 1901, and the same date 1900:

CHARACTER OF MONEY.	AMOUNT IN CIRCULATION JAN. 1,	
	1901.	1900.
Gold coin (including bullion-in-Treasury).....	\$639,192,578	\$617,977,880
Gold certificates.....	232,787,929	161,122,797
Standard silver dollars.....	76,182,326	70,430,047
Silver certificates.....	422,390,403	395,040,816
Subsidiary silver.....	83,123,463	76,651,321
Treasury notes of 1890.....	61,330,159	89,994,351
United States notes.....	334,587,495	318,369,365
Currency certificates, act of June 8, 1872.....	1,560,000	11,960,000
National bank notes.....	332,188,536	242,001,643
Total.....	\$2,178,251,879	\$1,980,396,170

It will be noticed there is a great increase in the issue of gold and silver certificates and national bank notes, and a decrease in that of Treasury notes of 1890, these latter notes being gradually replaced by silver certificates issued upon the silver dollars coined from the bullion purchased under the act of 1890, as authorized by law. The substitution of the certificates for the notes diminishes to its extent the possible demands upon the \$150,000,000 gold reserve fund. The increased issue of national bank notes is due to the more favorable terms given by the act of March 14, 1900, to banks taking out circulation.

The coinage executed at the several mints in 1900 and 1899 is shown by the following table. The silver dollars were coined from the silver purchased under the act of 1890, for which Treasury notes were issued.

UNIVERSALISTS. The Board of Trustees of the Universalist General Convention, following the by-laws of that body, published a report and financial statement on Oct. 1. This report contained returns from 1,003 parishes, in which were included 47,886 families, 53,070 church members, 59,034 members of Sunday schools, and which possessed parish property valued at \$9,735,294 less debt, and had raised \$1,244,493 of contributions, including those for parish expenses. The number

of church members had increased 893 during the year. These statistics relate only to the organized parishes in the Universalist fellowship, and necessarily take no account of families residing in territory where there are no such parishes, or of the great number of Universalists who in their neighborhoods attend other churches. A comparison with the statistics of fifteen years ago showed that during the interval the number of families had increased more than 30 per cent., the church membership more than 60 per cent., the parish property nearly 42 per cent., and the current expenditure nearly 44 per cent. The aggregate sum of \$21,324 had been received during the year from legacies and special gifts, and the total amount of the gifts of the year to the General and State Conventions and other bodies for missionary and other benevolent work had been \$77,746. The aggregate amount of the sums applied during the year for missionary and other church work was \$62,176. The permanent funds of the General and State Conventions and other missionary bodies amounted to \$800,696, showing an increase for the year of \$17,141. A special plea was made in the report in behalf of the mission in Japan, where much had been attempted and accomplished, and a great enlargement of missionary possibilities since the beginning of the work could be perceived. A foothold had been obtained, schools and churches established, tracts and books distributed, and "a goodly number of earnest and intelligent Japanese" drawn to the Universalist faith and Church. The organization of a canvass for a twentieth century fund having been directed by the General Convention, the Rev. Dr. Perin was commissioned to devote his whole time from Nov. 1, 1900, to this work, in addition to his duties as financial secretary. Pledges were to become payable when they amounted in all to \$100,000. The income only of the money contributed is to be used for the work of the General Convention.

URUGUAY, a republic in South America. The legislative power resides in the Congress, consisting of a Senate and a House of Representatives, sitting for five months annually and delegating the legislative authority and the control of the administration during the other months of the year to a standing committee of 2 Senators and 5 Representatives. The Representatives, 60 in number, are elected for three years in the ratio of 1 to 3,000 inhabitants by all adult male citizens who can read and write. The Senators, 19 in number, are elected in the departments that they represent by electoral colleges. The presidential term is four years. Juan Luis Cuestas was elected President for the term beginning March 1, 1899, and Rottle y Ordoñez Vice-President. The Cabinet at the beginning of 1900 was composed as follows: Minister of War and Marine, Gen. Callorda; Minister of the Interior and Justice, Saturnino Camp; Minister of Agriculture, Industry, Public Instruction, and Public Works, C. M. Peña; Minister of Finances, Dr. Campeste-guy; Minister of Foreign Affairs and Worship, Herrero y Espinosa.

Area and Population.—The area of Uruguay is 72,110 square miles. The population of the departments as determined by the census of March 1, 1900, is as follows: Artigas, 23,334; Canelones, 76,984; Cerro Largo, 33,039; Durazno, 33,733; Flores, 44,431; Florida, 39,985; La Colonia, 45,185; Maldonado, 24,048; Minas, 32,595; Montevideo, 253,306 (estimated); Paysandu, 38,543; Rio Negro, 18,574; Rivera, 22,509; Rocha, 26,727; Salto, 40,589; San José, 37,279; Soriano, 34,628; Tacuarembó, 34,424; Trienta y Tres, 22,757. The total population of the republic was

882,670. The census was imperfect, and 8 per cent. is added for omissions in the official estimate of population, making the total 900,619. The total population of the interior, without the 8 per cent. added to correct the census figures, was 599,364, comprising 308,670 males and 290,694 females. Of the males 250,524 are native-born, including children of foreigners, and of the females 258,641, while 58,146 males and 32,052 females are of foreign birth. About 15 per cent. of the population of the interior consists of foreign settlers, and in Montevideo 45 per cent. of the people are foreigners. The number of immigrants in 1898 was 9,467, and of departures 6,411. The Spanish and French immigrants are mostly Basques. There were 90,199 foreign-born residents of the interior in 1900, including 23,352 Spaniards, 24,349 Italians, 24,720 Brazilians, 9,140 Argentinians, 4,186 French, 675 English, 708 Germans, 994 Swiss, and 2,078 others. Among the immigrants in 1898 were 2,894 Italians, 3,339 Spaniards, 814 French, 673 Brazilians, 342 English, and 339 Germans. The number of marriages in 1898 was 4,318; of births, 29,870; of deaths, 13,255; excess of births, 16,615; number of marriages in 1899, 4,463; of births, 31,613; of deaths, 12,343; excess of births, 19,270. Education is compulsory in Uruguay, and there were 535 elementary schools in 1897, with 1,043 teachers and 45,614 pupils, the annual expense to the Government being \$677,000.

Finances.—The revenue in 1898 was \$15,200,000, and in 1899 it was \$15,750,000. For 1900 the estimate of revenue was \$15,977,992, of which customs produce \$10,480,000; the property tax, \$1840,845; trade licenses, \$890,325; industrial tax, \$475,297; tobacco tax, \$444,468; educational receipts, \$443,503; stamps, \$352,334; posts and telegraphs, \$310,000; bank profits, \$270,000; other sources, \$471,220. The expenditure was estimated at \$15,969,698, of which \$370,426 was for the Congress, \$65,827 for the presidency, \$120,806 for the Ministry of Foreign Affairs, \$2,230,995 for the Ministry of the Interior, \$959,424 for the Ministry of Finance, \$1,034,259 for the Ministry of Public Works; \$1,725,503 for the Ministry of War and Marine, \$342,249 for the judiciary, and \$9,120,209 for the public debt. The expenses of the public debt in 1899 were \$4,984,332 for interest and \$895,118 for amortization; total, \$5,879,450. The amount of outstanding obligations on Jan. 1, 1899, was \$124,425,395, the external loans amounting to \$100,325,072; international debt, \$4,113,476; internal debts, \$19,986,847. On Jan. 1, 1900, the total obligations amounted to \$127,159,529, an increase during the year of \$2,734,134. A new internal loan of \$4,000,000 was emitted, and \$1,265,866 of external and internal obligations were redeemed. The total amount of new debt created since the advent of President Cuestas was \$9,128,566, mainly in liquidation of the deficit and obligations inherited from the previous Government due to the civil war. Under Julio Herrera the debt increased from \$81,279,752 to \$103,584,039, a difference of \$22,304,287, which includes, however, the consolidation of the external debt by which a saving of interest was obtained. Under Idiarte Borda the increase was \$17,181,058, making the total at the accession of President Cuestas \$120,765,097. Under Juan L. Cuestas the net increase to the end of 1899 was \$6,394,432. The annual service of the public debt in 1899 was \$4,984,332 for interest, \$895,117 for amortization, and \$789,144 for railroad guarantees, making, with commissions and expenses, \$6,664,287. The state of the debt on Jan. 1, 1900, was \$23,101,898 of internal, \$100,161,606 of foreign,

and \$3,896,025 of international debt. The debt has grown up since 1860, when \$2,726,888 were emitted, and in 1865 it amounted to \$11,642,240, in 1870 to \$17,818,694, in 1875 to \$42,357,495, in 1880 to \$49,607,186, in 1885 to \$59,774,428, in 1890 to \$106,606,153, and in 1895 to \$106,606,153. The amount of the debt has grown much faster than population or commerce, and is to a great degree nominal, the market value being far below the face value of the bonds, amounting to not more than \$75,000,000 for the whole debt in 1900.

The silver money put into circulation between 1877 and 1897 was \$4,045,857. The Bank of the Republic, founded in 1896, with \$10,000,000 of capital paid in and a share capital of \$12,000,000 originally, increased in 1899 to \$1,700,000, has the exclusive right to issue bank notes in the future, and may issue them up to half the amount of subscribed capital. The circulation on Nov. 1, 1899, was \$4,465,250, and the cash in the bank amounted to \$3,805,000. The legal standard is gold, but there is no national gold coinage, though the coinage of doubloons has been authorized since 1862. The bank has the option of redeeming its notes in either gold or silver.

On July 13, 1900, an additional excise duty was imposed on sugar and increased import duties were put upon sugar, alcohol, wines, and spirits. The excessive import duties discourage the import trade and prevent the expansion of foreign commerce. The yield of the customs duties in the year ending June 30, 1900, was \$10,054,360, showing an increase of little over 3 per cent. as compared with 1899, far less than the increase of production and of population.

The Army and Navy.—The standing army consists of 231 officers and 3,273 men, organized in 4 battalions, 3 cavalry regiments, 1 regiment of light artillery, and 1 battalion of fortress artillery. The Mauser rifle is furnished to the infantry. The artillery has Krupp, Canet, Bange, Armstrong, and Nordenfeli guns. There is an armed constabulary of 3,200 men independent of the army, and about 20,000 men are enrolled in the National Guard. The naval force consists of 3 gunboats and 1 armed steamer, manned by 184 officers and men.

Commerce and Production.—The rearing of animals is the main industry of the country. There were 4,958,772 cattle, 358,067 horses, 13,144 mules, and 14,447,714 sheep in 1897. The number of cattle slaughtered in 1898 was 665,300, and in 1899 it was 821,600. The wool product in 1899 was 44,000 tons. The wheat crop in 1897 was estimated at 300,000 tons. The area of vineyards in 1898 was 3,160 hectares, producing 3,351,296 hectolitres of wine and 33,516 litres of brandy. Corn and other crops are also grown by the new settlers, who are rapidly extending the agricultural area. They plant tobacco also and have set out olive plantations. The production of gold in the department of Rivera was 87,336 grammes in 1897. The imports of merchandise in 1897 were valued at \$19,512,216, and of coin at \$3,035,679; exports of merchandise at \$29,319,573, and of coin at \$3,116,877. The value of merchandise imports in 1898 was \$24,784,360, and of exports \$30,276,916. Of the imports \$7,014,335 were articles of food and drink, \$212,389 tobacco, \$4,992,444 textiles, \$1,360,009 clothing, \$6,410,694 raw materials and machinery, and \$4,793,585 articles of other classes. Of the exports \$336,925 were live animals, \$26,243,492 animal products, \$3,315,543 products of agriculture, and \$380,954 other products. The exportation of jerked beef in 1897 was \$4,312,904 in value; of extract of beef, \$1,182,810; of hides and skins, \$6,633,981; of tallow,

\$1,299,130; of wool, \$12,402,802. The bulk of the commerce of 1898 was distributed among foreign countries as follows:

COUNTRIES.	Imports.	Exports.
Great Britain	\$6,702,798	\$2,884,338
Argentine Republic	8,288,714	5,318,270
France	2,697,749	5,516,888
Brazil	1,872,571	5,835,888
Belgium	1,372,665	5,399,281
Germany	2,311,630	2,810,833
United States	1,932,467	944,089
Italy	2,279,784	577,062
Spain	1,977,406	236,282

The total value of merchandise imports in 1899 was about \$24,000,000, and of exports \$37,000,000.

Navigation.—The number of vessels entered at the port of Montevideo in 1897 from over the sea was 1,126, of 1,904,626 tons; cleared, 1,024 vessels, of 1,796,529 tons; entered in the river and coast trade, 2,439 vessels, of 621,406 tons; cleared coastwise, 2,447, of 621,244 tons. The merchant navy consisted in 1898 of 28 steamers, of 7,654 tons, and 72 sailing vessels, of 21,251 tons.

Railroads, Posts, and Telegraphs.—The length of railroads on Jan. 1, 1899, was 1,008 miles, and there were 89 miles of tramways. The Government has guaranteed 3½ per cent. interest on £5,750,418, the capital cost of 882 miles of railroad, the total capitalization of the entire network being £11,150,857 sterling.

There are 4,380 miles of telegraph lines, including 982 miles belonging to the railroads. The number of dispatches in 1898 was 346,359.

The postal traffic for 1898 was 8,872,575 internal letters, newspapers, etc., and 6,970,238 in the international service; receipts, 1,786,186 francs; expenses, 1,944,425 francs.

UTAH, a Western State, admitted to the Union Jan. 4, 1896; area, 84,970 square miles. The population in 1890 was 207,905. In 1900 it was 276,749. Capital, Salt Lake City.

Government.—The State officers during the year were as follow: Governor, Heber M. Wells, Republican; Secretary of State, James T. Hammond; Treasurer, James Chipman; Auditor, Morgan Richards, Jr.; Attorney-General, A. C. Bishop; Adjutant General, Charles S. Burton; Superintendent of Public Instruction, John R. Park; Coal Mine Inspector, Gomer Thomas; State Engineer, Robert C. Gemmell; Board of Equalization, Robert C. Lund, John J. Thomas, J. E. Booth, and Thomas D. Dee; Board of Labor, John Nicholson, J. S. Daveler; Board of Agriculture, J. A. Wright, Secretary; State Art Institute, created in 1899, H. L. A. Culmer, President.

Finances.—On May 31 the State Loan Commissioners offered the State's new issue of bonds. Sealed bids were also solicited for the sale of the State's lawful money issue of \$300,000 twenty-year 3-per-cent. bonds, to refund the old series of 5-per-cent. bonds sold in 1890. The commissioners finally made the rate 3½ per cent., and sold the whole at par, the buyers to bear all the expense of calling in the old series and engraving and floating the new issue. The money saved to the State by reason of this rate of interest during the period of the next ten years, which would be the remainder of the old bonds, will be \$52,500. The Treasurer's report for December, 1900, showed these receipts: Tax collections and land sales, \$588,672.85; balance on hand, Dec. 1, \$202,208.02; total, \$790,880.87. The disbursements were: Re-payment of temporary loan, \$175,000; general fund warrants redeemed, \$51,677.94; investments of land funds, \$11,233.03; total disbursements, \$237,910.97; balance on hand, Dec. 31, \$552,969.90;

total, \$790,880.87. The balance on hand was apportioned to the several funds, as follows: District school fund, \$279,456.89; general fund, \$211,472; university land fund, \$37,193.06; school fund investment, \$10,230.51; sundry land funds, \$14,617.44; total, \$552,969.90.

Valuation.—In 1899 the total valuation by the State Board of Equalization was \$90,713,499. In 1900 it was \$105,629,041. There is a gain of \$1,200,000 in the value of real estate, \$1,400,000 in improvements, \$1,500,000 in personal property, and \$1,900,000 in corporation property.

The value of horses and mules in Utah in 1899 was placed at \$1,275,708; in 1900 the valuation of the same class of property was \$1,414,693. In 1899 there were 183,015 cattle in the State; in 1900 192,216 were assessed, and their valuation was given as \$3,199,789. There was a falling off in sheep, but the statement is made that the figures given do not cover all the sheep owned in Utah, and that fully 1,800,000 sheep that graze in Idaho, Colorado, Wyoming, and Montana are owned by Utah men, although they are assessed in the States in which they range. An explanation of this will be seen in the fact that although the assessment for 1899 was for 1,621,733 sheep and in 1900 for only 1,566,101, the valuation this year is more than \$600,000 above that of last year.

The sheep were never in better condition, the pasturage has been fine, and the sheepmen are well organized.

Only 15,848 swine were owned in the State in 1900, against 15,961 in 1899. The valuation for 1900 was \$45,656.

Summing up all live stock within the State, there is a gain of more than \$1,250,000 for 1900, according to figures furnished by Secretary Thomas, of the State Board of Equalization. These figures show that the total valuation of live stock in the State is \$8,600,090.

Banks.—The banks throughout the State make an encouraging report; most of them show a material increase in deposits, loans, and discounts. Up to Nov. 30 the failures numbered 49, the actual assets being \$95,965 and the liabilities \$192,862. In 1899 there were 59 failures, the total assets of which were \$147,550, while the liabilities were \$359,629. The total bank clearings for 1900 were \$106,734,563.

Precious Metals.—Utah has ranked as the sixth in gold-producing and the third in silver-producing States of the Union, but in 1900 she leaped beyond all former records in the production of her 4 chief metals—gold, silver, copper, and lead. Her silver output in 1899 was rated at \$9,696,969, and her gold output at \$3,369,509. In 1900 the output of gold increased \$600,000, and that of silver \$1,600,000. The copper advanced from \$1,246,000 in 1899 to \$2,514,597 in 1900. This shows the silver gain about 25 per cent. and gold 15 per cent., while lead has made a gain of about 13 per cent. The whole output of the mines is about one third of the total productive wealth of the State.

State Lands.—The new purchasers of State lands number 3,810. Some of these paid in full, but the great majority availed themselves of the opportunity of paying a tenth of the purchase price yearly. Since statehood the State land sales have aggregated 497,090.14 acres, representing a total sale price of \$1,061,541.06. In 1900, 244,248 acres were sold, the total sale price being \$309,974.91. This shows that the business of the State Land Board for the year was nearly 60 per cent. as much as for the whole period since the State became possessed of lands to sell.

Leases of mountain lands for sheep grazing were made for 106,531 acres, appraised at \$152,226, upon which the annual rental is \$6,300.44.

All the revenues for sales and leases of State lands are held in the State treasury in separate funds, and whenever opportunity offers investments are made in Government, municipal, county, and school-district bonds, and in mortgages on farms. Only the earnings of these investments are available for the educational institutions of the State, made beneficiaries by the State's enabling act. In the cases of land revenues going to the establishment of institutions and other public undertakings, the interest is added to the principal, and this will continue until each particular fund is large enough to begin building. The State has the following amounts now out (exclusive of small uninvested balances in the treasury) drawing interest for the funds mentioned: District school, \$164,168; university land, \$150,835; reservoir land, \$19,856; Insane Asylum, \$3,815; School of Mines, \$5,091; Agricultural College, \$5,820; Institution for the Blind, \$2,260; State Capitol, \$3,650; Miners' Hospital, \$2,800; Normal School, \$100; Deaf and Dumb School, \$3,095; Reform School, \$6,364; total, \$367,854.

Education.—According to the report of the State Superintendent, at the close of the school term, July 1, there was a school population of 86,353. This includes all between the ages of six and eighteen, and shows a net increase of 1,934 over the preceding year. There are 43,119 white boys and 43,030 white girls, and 106 colored boys and 98 colored girls. Boys to the number of 38,156, and 38,384 girls, can read and write. Attending the public schools were 36,568 boys and 36,457 girls; attending private schools, 1,139 boys and 1,294 girls; attending no school, 5,518 boys and 5,377 girls. Fifty-three deaf and 8 blind persons between the ages of five and thirty years are noted in the report.

In the year ending June 30, \$1,232,499.03 was expended for the maintenance of public schools. The revenues amounted to \$1,301,610.54, including a balance on hand at the beginning of the year of \$117,297.25. The unexpended balance at the close of the year was \$69,111.51.

The school revenues were from the following sources: District taxes, \$628,194.45; State taxes, \$226,701.53; county taxes, \$119,155.59; sale of bonds, \$47,856.16; sinking funds, \$16,853.12; tuition fees, \$1,202.47; sundry other sources, \$44,345.96. The expenditures were: Salaries of male teachers, \$239,303.03; female teachers, \$346,841.49; new buildings and land, \$152,327.87; interest on bonds, \$57,052.64; current expenses, exclusive of salaries or janitor service, \$50,674.88; repairs and improvements, \$44,442.33; janitor service, \$43,972.93; sinking fund investments, \$30,462.42; redemption of bonds, \$25,862.70; compensation to trustees, \$24,456.35; furniture and apparatus, \$26,610.54; supplies, \$15,292.52; rent of buildings, \$8,978.92; text-books for indigent pupils, \$7,247.58; taking school census, \$2,685.47; books for school libraries, \$1,886.42; disbursements for purposes not otherwise stated, \$38,348.94.

The total bonded debt of school districts is \$1,089,410, and the floating indebtedness \$85,374.92. The net increase of indebtedness in 1900 was \$16,089.84.

The State Teachers' Association held its convention in Salt Lake City the last week in December, adopted a new constitution and by-laws, and elected officers. Frank B. Cooper, Superintendent of the Board of Education, was elected president, and Frank Evans, of Ogden, was re-elected secretary.

Prof. J. H. Paul urged the need of securing suitable text-books on botany, geology, and meteorology for use in the schools of Utah, Montana, Colorado, and other Western States. Other discussions were on the need of art in public education and Nature study in schools.

Coal.—It is estimated that coal worth \$3,200,000 was produced in 1900, and more than \$1,000,000 expended in miners' wages; and this leaves out of account the cost of improvements at the mines.

At Scofield, May 1, about 200 men and boys met their deaths by a mine explosion. Investigation seemed to prove that this resulted from a surplus of coal dust, the needful sprinkling of which had been neglected. After a full inquiry the company was exonerated. Financial aid came promptly, not only from the company, but from people all over the State, and even from outside. Within a few days more than \$100,000 was raised, and the fund increased to goodly proportions. Much of what was known as "the Winter Quarters" of the Pleasant Valley mining region was swept away. The improvements made in the winter quarters during the year aggregates \$37,000. This includes the building of new houses and new facilities for handling coal. At Clear Creek, another point of the Pleasant Valley Company's works, the recent improvements have cost \$46,000; at Castlegate \$79,000 was expended.

It is estimated that this company alone controls 10,000 square miles of coal land, some of which has not yet been touched, and much more only "scratched." The average wages is \$2.50 a day. This company mined more than 1,000,000 tons of coal; its pay rolls aggregated \$960,000, and 1,059 men were employed through the year.

The following statistics were given by Gomer Thomas, State Inspector of Mines: The number of men employed in Utah coal mines in 1900 was 1,504, a gain over the previous year of 381; the tonnage of coal for 1900 was 1,224,176, a gain of 348,304 tons. The number of accidents during the year was 272; fatal, 209. Twelve mines were opened in Carbon County, 15 in Emery County. No mines were suspended or abandoned during the year.

Fish and Game.—The past season is the first that the hatchery has been in full operation, and, despite some unforeseen drawbacks, the result is most encouraging.

The hatchery was located about 1½ mile east of Murray, on 5½ acres of land along Spring run. The cost of land, building, drive well for water that maintains an even temperature all the year round, equipment, etc., approximates to \$4,600, and the needs of the hatchery for the next two years are placed at \$3,860, exclusive of \$1,500 for a dwelling for the superintendent. It was formally opened on Dec. 30, 1899. In the season 1900-'01 190,000 trout eggs of various kinds were received, which were hatched and planted in the waters of Utah, the loss being a little less than 4 per cent.

Commissioner Sharp suggests that the hatchery can easily be made to rear from 2,000,000 to 3,000,000 young trout every year if advantage is taken of the varying spawning periods. During this first year there were received at the hatchery 500,000 Eastern lake trout eggs, 350,000 Eastern brook trout eggs, 5,000 landlocked salmon from Green lake, Maine, 25,000 native or black-spotted trout eggs from Big Cottonwood creek, 75,000 grayling trout eggs from Montana, and 10,000 steelheads from Oregon. The distribution was made with reference to the nearness of streams to railroads and other conditions favorable to propagation.

The report says that in the two years just closed a total of 1,010,574 pounds of fish have been caught in the public waters and sold in local markets, representing a value of \$68,391, and these figures do not take in the catch made for private consumption.

Incomplete reports show that during the year 66,392 wild ducks were killed and sold, and that 724 grouse were marketed. These, together with 12,760 pounds of venison, represent a value of \$12,433.

Owing to the avariciousness of market hunters, large game animals once abundant, such as the elk, antelope, and mountain sheep, are fast becoming extinct, and the same is true of sage hens, pine hens, and various kinds of native grouse.

Industries.—There has been ample proof that flour milling might become one of the most prosperous of Utah industries could an outside market be found for the surplus. There are 75 flour mills in the State, with a capacity for turning out at least 2,000,000 barrels of flour in a year, and this would mean the consumption of 9,000,000 bushels of wheat, almost twice the yield of the State for this year. The mills stand idle a good portion of the time, while the wheat is shipped out unground or consumed at home as stock feed. Good judges place the wheat crop for 1900 at nearly 4,000,000 bushels.

Fifty-seven creameries are working in the State, 5 having been added during the year. The capital was estimated at \$200,000. Considerable new capital has been added within the year, and the output, including butter, cheese, and skim milk, amounted to about \$900,000. Considerable business is still done in the old line of dairy work.

The beet-sugar industry produced nearly \$1,000,000 in income during the year. Hitherto the great sugar works at Lehigh absorbed most of the beet product, a great system of piping having been laid for the drawing of beet juice from outlying sections. New factories have started up, and every inducement is offered to farmers for the raising of beets. Even the pulp, which the factories resell to the farmers, has proved valuable as a fattener of cattle.

The industry has been stimulated too by the prices offered by the Colorado Sugar Manufacturing Company for next year's crop of Utah beets. Manager McFarland has announced the following schedule: Twelve per cent. purity, \$4.25; 13 per cent. purity, \$4.58; 14 per cent. purity, \$4.91; 15 per cent. purity, \$5.25; 16 per cent. purity, \$5.58; 17 per cent. purity, \$5.91; 18 per cent. purity, \$6.25; 19 per cent. purity, \$6.58; 20 per cent. purity, \$6.91; 21 per cent. purity, \$7.58.

In the last two years sugar-beet raising has increased enormously. Cache County alone yielded 6,500 tons of beets in 1900, produced on about 500 acres. The beets bring \$3.50 a ton delivered on the cars.

An offer from the Ogden Sugar Company has also raised the price of beets at home. A year ago it paid \$4.25 a ton; this year it offers \$4.50 for beets containing 12 or more per cent. of saccharine matter.

The tomato crop was unusually heavy, and the canning factories were unable to cope with it. Hence many farmers complain that contracts were broken, and threaten damage suits. The factory people say that some of the tomatoes were damaged by frost. There is a call for more canning factories. The figures for this year show 225,000 cases.

For a Library.—John Q. Packard has given a tract of land worth \$20,000 to found a free library in Salt Lake City, and \$75,000 to build with.

Mothers' Congress.—The Mothers' Congress held its third annual meeting in Salt Lake City in April. Its discussions were full and interesting, and the attendance at the meetings large. Kindergarten work was treated from every point of view. The duty of mothers in the matter of the spiritual training of the young, prenatal influences, heredity, environment, and the relations of the family, especially those of parents and children, were treated exhaustively. The evening sessions were especially large and spirited.

Art Institute.—The Utah Art Institute in its report says that the 31 lectures under the institute's direction for the purpose of awakening interest in art have been productive of much good. Many pictures were given to the institute. The revenues were \$3,409.40, and the expenditures were within this sum.

Monument.—Utah's monument to pioneers, surmounted by a statue of Brigham Young, was unveiled by his great-granddaughter on July 25. Near the base is a figure group representing an Indian, a trapper, and a pioneer. The sculptor is C. E. Dallin.

Mormons.—Reports from returned missionaries seem to show that the gaining of converts to Mormonism is a harder task in France and Germany than in England even, and is easiest in Scandinavia. The latter folk held a jubilee in Salt Lake City to celebrate the fiftieth anniversary of the advent of Mormonism into Denmark, Sweden, and Norway.

The ninety-fifth birthday anniversary of Joseph Smith, founder of Mormonism, occurred on Dec. 23, and was celebrated in the new Sixteenth Meetinghouse, dedicated the same day, and built on the corner of Fifth West and North Temple Streets, Salt Lake City, on the site of a log hut put up in 1849 which served for both church and school. The new building was packed with people, and among the old settlers was the aged widow of the prophet.

Irrigation.—About the middle of December the Utah Light and Power Company disclosed an arrangement for constructing four great reservoirs in the Ogden cañon, which will furnish 10,000 horse power, irrigate 75,000 acres of arid land, and supply Ogden with water. The water thus stored would enable the power company to operate its power plant the entire season up to its full capacity (10,000 horse power) while irrigating lands in the western and northwestern parts of the county and adjoining portions of Box Elder County. It would also give a water supply for a city system greater than the one that now supplies Ogden.

Unoccupied Land.—It has often been said that the most desirable lands of Utah have been settled for years, yet each year shows great tracts of fertile land reclaimed by irrigation. The State offers an inducement of ten years' time for paying for land, and because of this many intending settlers on Government tracts relinquish their holdings to the State, have the Land Board select the holdings to apply upon some of the State grants, and then contract with the State for the purchase of the land on the easiest terms. In this way the State is enabled to do an enormous amount of business in the sale of lands for the benefit of Utah's public institutions.

Through the operation of the enabling act by which Utah was admitted to the Union, four sections in each township, or about 5,760,000 acres, were granted for the maintenance of the public schools, 125,000 acres were ceded for maintaining the university, 500,000 acres were allowed for establishing reservoirs, 200,000 acres for the Agricultural College, 100,000 acres each for to help sup-

port the Insane Asylum, the Deaf and Dumb Asylum, the Institution for the Blind, the Reform School, the State Normal School of Mines, 64,000 acres for a State School of Mines, the same for a State Capitol, and 50,000 acres for a miners' hospital. Out of these munificent grants, 7,300,000 acres in all, less than 500,000 acres have been sold by the State.

State Institutions.—A hospital was added to the Deaf, Dumb, and Blind Institution in 1900. The sum of \$3,500 was appropriated by the Legislature for the current expenses of the hospital. The expenses of the year were \$5,542.03, but the deficiency was paid from funds earned by the institution. A physical laboratory has been added to the school, and the library has been increased.

Three students have been graduated in the past two years, and 13 since the institution was founded. The total attendance in the two years was 123; the present enrollment is 76.

Fifty-seven acres of land belong to the institution, valued at \$15,000, and the buildings at \$100,000.

At a meeting of the board of the Insane Asylum in November, Medical Superintendent Hardy reported as follows: In the asylum Oct. 31, 164 men and 155 women. Requisition was made on the Auditor for the sum of \$3,302.73, to pay the expenses for October.

Political.—In February Gov. Wells issued a call for the special election of a Congressman to fill the seat made vacant by the retirement of Mr. Roberts, and on April 3 W. H. King was elected.

On July 1 Mrs. J. M. Cohen, the first woman delegate to a national convention, was sent by the Democrats of Utah to Kansas City.

On Sept. 6 the Democratic State Convention was held. James H. Moyle was nominated for Governor; Fisher Harris for Secretary of State; Lund for Treasurer; Whitecotton for Judge of the Supreme Court; Weber for Attorney-General; Porter for Superintendent of Public Instruction; Hayes for Auditor.

The Republicans nominated, for Governor. Heber M. Wells; Secretary of State, J. T. Hammond; Justice of the Supreme Court, George W. Barch; Attorney-General, M. A. Breeden; Superintendent of Public Instruction, A. C. Nelson; Treasurer, John De Grey Dixon; Auditor, T. S. Tingley. This ticket was elected. The plurality was: Wells, 3,153; Hammond, 2,467; Barch, 2,971; Breeden, 1,337; Nelson, 1,551; Dixon, 2,208; and Tingley, 1,738. In the presidential election the Republican electors received 47,139 votes, the Democratic 45,006.

The vote for presidential electors gave the Republican candidates 47,139, and the Democratic 45,006.

V

VENEZUELA, a federal republic in South America. The legislative power is vested in the Congress, consisting of a Senate of 27 members, 3 from each State, and a House of Representatives numbering 63 members, 1 to 35,000 inhabitants, who are elected for four years by the votes of all adult male citizens. The Congress elects for two years a Council of Government, and for the same term the Council elects the President of the republic. Gen. Ignacio Andrade, who was elected for the term beginning March 4, 1898, was deposed by a revolution and Gen. Cipriano Castro was invested by Congress with supreme power as provisional President on Oct. 21, 1899. The Cabinet, appointed on Oct. 23, 1899, was composed as follows: Minister of the Interior, Francisco Castillo; Minister of Foreign Affairs, Anduego Palacio; Minister of Finance, Tello Mendoza; Minister of War, Gen. Ignacio Pulido; Minister of Agriculture, Industry, and Commerce, Manuel Hernandez; Minister of Public Works, Victor Rodriguez; Minister of Public Instruction, Clemente Urbaneja.

Area and Population.—Venezuela has an area of 593,943 square miles. The population in 1894 consisted of 1,197,069 males and 1,247,747 females; total, 2,444,816. The number of foreigners was 44,129, comprising 11,081 Colombians, 518 other South Americans, 232 North Americans, 13,558 Spaniards, 6,154 English, 3,729 Dutch, 3,179 Italians, 2,545 French, 262 Germans, 82 Danes, and 2,089 others. The population was composed of 376,156 persons engaged in agriculture, 135,688 in industry, 8,341 in navigation, 1,052 in mining, 42,816 in commerce, 3,675 functionaries, 528 religious, 6,038 military, 9,311 in the liberal professions, 211,143 domestics, and 1,650,068 nonworkers. The number of marriages in 1894 was 4,612; of births, 80,819; of deaths, 46,410; excess of births, 34,409. The immigration was 141, and for ten years ending with 1894 it was 5,548.

Finances.—The budget for 1900 makes the total revenue 38,877,480 bolivars, or francs, of

which 26,000,000 bolivars come from customs, 2,689,680 bolivars from stamps, 2,593,300 bolivars from internal revenue, 4,722,500 bolivars from transit dues, 2,860,000 bolivars from salt, and 32,000 bolivars from public lands. The expenses were estimated at the same figure, 19,893,456 bolivars being allotted to the public service, 4,967,000 bolivars to the internal debt, 2,135,203 bolivars to the exterior debt, 3,000,000 bolivars to the Venezuelan loan, 887,321 bolivars to foreign creditors, 2,340,000 bolivars to public works, and 5,654,500 bolivars to subsidies.

The public debt on June 30, 1898, amounted to 201,419,202 bolivars. When Venezuela seceded from Colombia in 1830 the share of the debt incurred in the war of independence assumed was £1,888,396, for which, including unpaid interest, new external bonds for £2,750,000 were issued in 1881, and of these £2,638,200 were outstanding in 1898, in addition to which 50,000,000 bolivars of 5-per-cent. bonds were issued in 1896 for the settlement of arrears of railroad guarantees, making the total foreign debt £4,587,900. The internal debt on Jan. 1, 1899, was 79,783,511 bolivars. A law was made in July, 1896, ordaining that the issue of paper money by the Government, and also the coinage of silver and nickel without special enactment by Congress, should cease from that time, as it was intended that gold coins and gold certificates should take the place of silver and uncovered paper. There were 12,000,000 bolivars in paper and 8,000,000 bolivars in silver in circulation, and the silver has since been kept practically on a par with gold. The Bank of Venezuela, with 12,000,000 bolivars capital, obtained in 1897 the right to collect and disburse the revenue for five years, receiving 2 per cent. commission on all collections and payments, and was allowed 8 per cent. interest on advances to the Government, which it agreed to make up to 6,000,000 bolivars. At the same date a charter was granted to the Bolivar Bank, a new bank of issue, with 20,000,000 bolivars capital, which obtained the administration of the

salt deposits, receiving 10 per cent. of the net revenue, and agreed to extend credit to the Government likewise to the extent of 6,000,000 bolivars at 8 per cent. interest, and also to lend 10,000,000 bolivars to cattle breeders and farmers.

The Army and Navy.—The permanent army consists of 3,600 men, distributed in garrisons throughout the country. The militia, in which every man is enrolled between the ages of eighteen and forty-six, numbers about 250,000 men. The fleet consists of 3 unarmored steamers and several small gunboats.

Commerce.—The principal exportable product is coffee, of which 13,808 tons were shipped from the port of La Guayra in 1898, 13,023 tons from Puerto Cabello, 26,495 tons from Maracaibo, and 119 tons from Ciudad Bolivar; of cacao, 5,290 tons from La Guayra, 326 tons from Puerto Cabello, 130 tons from Maracaibo, and 41 tons from Ciudad Bolivar. The export of hides and skins was 3,454 tons; of rubber, 580 tons; of quina bark, 13,004 kilogrammes. Sugar, copaiba, tonga beans, feathers, fustic, divi-divi, and fish sounds are also exported. The export of gold bars was 1,218 kilogrammes. The chief imports are provisions, dry goods, hardware, coal, kerosene, timber, cement, and machinery.

Navigation.—The number of vessels that visited La Guayra in 1898 was 332, of 473,164 tons; Ciudad Bolivar, 129, of 44,088 tons; Puerto Cabello, 152, of 218,788 tons; Maracaibo, 302, of 29,220 tons. The merchant fleet of Venezuela consisted of 11 steamers, of 2,185 tons, and 17 sailing vessels, of 2,760 tons.

Railroads and Telegraphs.—There were 529 miles of railroads in operation in 1899. A contract was concluded in April of that year for the construction of a line from Puerto Cabello to Yaritagua. Contracts were made in 1896 for branch railroads and for steamboat service on the Lake of Valencia.

The length of telegraph lines in operation in 1898 was 3,882 miles.

Political Affairs.—Financial and political internal complications and difficulties kept Venezuela in a state of unrest in 1900 and disturbed commerce. In January the Government had a quarrel with the directors of the Bank of Caracas and the Bank of Venezuela because they refused to advance money, and the officers of these banks and other prominent business men, many of them foreigners, were arrested. The Opposition party made trouble for the Government in several of the states, but in July peace was officially proclaimed and political prisoners were set at liberty. On July 30 a new Cabinet was appointed, as follows: Minister of the Interior, Dr. Rafael Cabrera Malo; Minister of Foreign Affairs, Dr. Eduardo Blanco; Minister of War and Marine, Gen. J. Prilido; Minister of Finance, Tello Mendoza; Minister of Public Works, Juan Otañez; Minister of Public Instruction, Dr. Felix Quintero; Minister of Commerce, Ramon Ayala. A dispute arose later between the Government and an American company regarding the limits of the latter's concession.

VERMONT, a New England State, admitted to the Union March 4, 1791; area, 9,565 square miles. The population, according to each decennial census, was 154,465 in 1800; 217,895 in 1810; 235,966 in 1820; 280,652 in 1830; 281,948 in 1840; 314,120 in 1850; 315,098 in 1860; 350,551 in 1870; 332,286 in 1880; 332,422 in 1890; and 343,641 in 1900. Capital, Montpelier.

Government.—The following were the State officers in 1900: Governor, Edward C. Smith; Lieutenant Governor, Henry C. Bates; Secretary of State, Frederick A. Howland; Treasurer, John

L. Bacon; Auditor, Orion M. Barber; Adjutant General, T. S. Peck, resigned, and succeeded, Oct. 1, by W. H. Gilmore; Railroad Commissioners, Messrs. Foster, Miller, and Watson; Superintendent of Education, Mason S. Stone; Fish and Game Commissioner, John W. Titcomb; Highway Commissioner, W. B. Viall; Inspector of Finance, F. S. Platt; Chief Justice of the Supreme Court, Russell S. Taft; Associate Justices, Loveland Munson, John W. Rowell, John H. Watson, H. R. Start, L. H. Thompson, James M. Tyler; Clerk, M. E. Smilie. All are Republicans.

State officers are elected biennially, in September of the even-numbered years. The Legislature meets biennially in October of the same years. There are 30 Senators and 245 Representatives. The town system of representation is still maintained.

Population.—The population of the State by counties in 1900 was as follows: Addison, 21,912; Bennington, 21,705; Caledonia, 24,381; Chittenden, 39,600; Essex, 8,856; Franklin, 30,198; Grand Isle, 4,462; Lamoille, 12,249; Orange, 19,313; Orleans, 22,024; Rutland, 44,209; Washington, 36,607; Windham, 26,660; Windsor, 32,225. Addison, Essex, Lamoille, Orange, and Orleans lose in numbers. The largest gain is in Washington County, from 29,606 to 36,607, an increase of 7,001, or about 24 per cent. The next in order are Grand Isle, 619, or 16 per cent.; Chittenden, 4,211, or less than 12 per cent.; Rutland, 812, or less than 2 per cent. The State as a whole has made the first appreciable gain that has been made in thirty years.

There are 48 incorporated cities and villages in Vermont, for which the population in 1900 is separately returned. Of these only 13 had a population of more than 2,000 in 1900, and only 2 more than 10,000—namely, Burlington, with 18,640, and Rutland, with 11,499. Those having a population of 2,000 or more are as follow: Barre, 8,448; Bellows Falls, 4,337; Bennington, 5,656; Brattleboro, 5,297; Burlington, 18,640; Fairhaven, 2,470; Montpelier, 6,266; Proctor, 2,013; Rutland, 11,499; St. Albans, 6,239; St. Johnsbury, 5,666; Springfield, 2,040; Winooski, 3,783.

Finances.—The financial condition of the State on June 30, 1900, was as follows: Resources—cash on hand and in banks, \$117,161.20; due from towns, State tax, \$4,412.79; corporation taxes estimated, \$400,000; collateral inheritance tax estimated, \$20,000; total, \$541,573.99. Liabilities—due to towns United States deposit money, \$14,383.26; due to soldiers' unpaid balances, \$8,312.18; due to towns for school and highway taxes, \$171,991.08; Auditor's orders unpaid, \$13,971.54; total, \$208,658.06. This left available for the fiscal year from July 1, 1900, to June 30, 1901, \$332,915.93.

The receipts for the two years ending on that date were: Cash on hand and in banks, June 30, 1898, \$137,431.76; tax, collateral inheritance, \$39,988.80; tax, corporation, \$841,633.47; tax, State, \$355,972.50; from all other sources, \$255,675.59; total, \$1,630,702.21. The disbursements were: Paid soldiers, State and allotted pay, \$32,438.55; paid debentures, Legislature, \$57,844.20; paid balance temporary loans, \$145,000; paid interest, \$49,930; paid Auditor's orders, \$1,228,323.26; balance cash on hand and in banks, \$117,161.20; total, \$1,630,702.21.

Besides the amount paid on Auditor's orders as given above, there were orders outstanding and unpaid to the amount of \$13,971.54. So that all the orders drawn for State expenses for the biennial term amount to the sum of \$1,242,290.80.

The Auditor reports that the net amount of

State expenses for which orders were drawn for the biennial term was \$1,098,583.77, of which the following is a summary: Administration of justice, \$323,766.02; agricultural, \$23,525.64; county commissioners, \$1,632.67; Dairymen's Association, \$2,000; educational, 112,542.88; executive departments, \$49,017.98; fish and game, \$8,770.94; insane, \$259,578.98; legislative expense, \$69,104.23; libraries, \$10,514.07; Maple Sugar Makers' Association, \$1,000; military, \$39,820.60; moieties under liquor law, \$41.25; noxious animals, \$2,957.50; penal, \$82,102.26; pensions, \$480; public health, \$22,431.09; printing, \$18,470.45; Railroad commissioners, \$6,315.13; soldiers' claims under No. 86, 1898, \$11,132.62; Soldiers' Home and deceased veterans, \$25,207.25; special appropriations, 1898, \$19,627.39; special commissions, \$3,532.22; total, \$1,098,583.77.

Adding to this sum what the Treasurer has paid by authority of law, without orders from the Auditor, it appears that the State expenses for the biennial term were nearly \$1,180,000.

Education.—Among the statistics given by the superintendent in August were the following: Total school expenditures, \$1,074,221.88; cost per pupil of total expenditure, \$16.28; current expenses, \$873,397.63; cost per pupil of current expenses, \$13.24; number of children between five and twenty-one years, 90,648; number in attendance, 65,964; number of male teachers, 510; number of female teachers, 3,232; number of Vermont normal school graduates, 632; number of college graduates, 201.

The Insane.—There were 551 patients at the Insane Asylum, Waterbury, at the close of the year, 51 in excess of its normal capacity. The cost per capita each week was \$3.50. Private patients paid \$5,623 during the year. At the Brattleboro Retreat there were 291 inmates, who were cared for at a weekly cost of \$3.75 each. This institution has accommodations for 350.

Railroads.—The seventh biennial report of the Railroad Commissioners covers the term ending July 1. Many and great improvements have been made in the condition of the trunk line railroads during the past two years. New and heavier steel rails have been substituted for old and lighter weight rails; iron bridges of increased carrying capacity have replaced most of the old wooden ones and some of the iron bridges of lesser strength; passenger depots have been rebuilt or repaired; and the roadbeds have been greatly improved by an unusually large amount of ballasting and renewals of ties. The Central Vermont Company has expended more than \$425,000 upon its system since it took possession of the property, May 1, 1899. Large expenditures have also been made for permanent improvements on the lines of the Boston and Maine and the Rutland Railroad in this State. Notwithstanding the large outlay of money by railroad companies to insure safety, expedition, and comfort to passenger traffic, and quick shipments of freight traffic, the average receipts per passenger per mile and the average receipts per ton per mile by the railroad companies of the State have gradually decreased during the past ten years.

The electric railways have 64.91 miles of main line and 9.07 of branches and spurs.

The number of fatal accidents reported is 41; accidents not fatal, 45. Twelve of the 19 companies reporting have paid dividends for the fiscal years 1897-'98 and 1898-'99, and 4 that did not pay a dividend showed a surplus from operation; the others showed deficits.

Highways.—The first annual report of the Commissioner of Highways shows that in 1900 the

total mileage of the highways was 14,825 miles, and 124 miles of permanent roadway was built at a cost of \$101,331.84, and the State paid \$87,257.17 of the cost.

Insurance.—The cost of State supervision of insurance was \$4,261.42 for the year ending June 30, 1900. The National Life Company, of Montpelier, celebrated its semicentennial in July. During the year this company wrote new insurance to the amount of \$1,005,615; and at the end of the year had outstanding insurance to the amount of \$5,311,170.

The Vermont Mutual Fire Insurance Company, in its seventy-third annual report, shows that the company has increased its surplus in the last fiscal year from \$88,967.43 to \$97,624.21. The number of policies issued during the year was 12,549, insuring property to the amount of \$17,080,702; premium notes taken, \$1,308,345; making the whole amount of premium notes in force Aug. 1, 1900, \$4,280,641, and the aggregate amount at risk \$54,341,496. The assessment is 4 per cent., a rate that has been maintained since and including 1897. The outstanding policies number 41,529.

Banks.—The State Inspector of Finance finds that there are 22 savings banks and 19 trust companies. Their united deposits are \$38,000,000, a gain during the year of \$1,763,644. The number of depositors is 118,354, of whom 103,799 are residents of the State, or almost 1 in 3 of the whole population in Vermont. The nonresident depositors number 14,555, with deposits of \$6,421,508. The average credit to each depositor is \$323.52.

The doors of the Merchants' National Bank, Rutland, were closed March 26 in consequence of the defalcation of the cashier, C. W. Mussey, for about \$150,000. The shortages had been adroitly concealed so as to deceive not only the committee of directors which periodically went over the accounts, but 3 bank examiners, all experts, who have examined the bank within a year. The cashier was tried and sentenced to seven years in the House of Correction at Rutland. In his confession he implicated the proprietor of a music store in Rutland, whose trial did not take place before the close of the year.

About April 15 a shortage of \$25,000 was discovered in the funds of the Waterbury National Bank. The missing funds, it was found, had been lost by the teller, J. C. Farrar, in stock speculations. His sentence was six years. The capital of the bank was not impaired.

Cattle.—According to the report of the Cattle Commission, 72,893 cattle were tested for tuberculosis during the year, and of that number 2,903 were killed. The total amount paid owners for cattle killed was \$36,902.25.

Legislative Session.—The General Assembly met Oct. 4, and adjourned Nov. 27. Fletcher D. Proctor was Speaker of the House.

An election was held to fill the vacancy caused by the death of United States Senator Morrill. It had been temporarily filled by the appointment of Hon. Jonathan Ross, who was a candidate for election by the Legislature. The other Republican candidates were ex-Gov. William P. Dillingham, Hon. W. W. Grout, and Charles A. Prouty. Seneca Hazleton was the choice of the Democrats. The choice was made on the third ballot; Mr. Prouty had withdrawn; the Democratic members transferred their votes to Mr. Dillingham, and he was elected by a vote of 162 out of 270.

The Constitution permits constitutional amendments to be offered only once in ten years, and this was one of the years. Four were proposed. One of them was to do away with this restriction and allow amendments to be offered at any regular

session, beginning with 1904. This was rejected. Another was to change the time of holding the State election from September to November, and the date of meeting of the General Assembly from October to January; this also was defeated. A third was to divide the State into 30 senatorial districts, according to population, and this failed. The fourth proposed amendment is to authorize the Legislature to provide by law for filling vacancies in the offices

WILLIAM W. STICKNEY,
GOVERNOR OF VERMONT.

of State Senator and Representative. This was passed; but to become effective it must pass the Legislature of 1902 and be adopted at the polls.

The important question of the year was that of substituting high license or local option for the prohibitory law. Numerous petitions for each side were sent in and bills were introduced. It was proposed to refer to the vote of the electors the

plan of substituting local option for the present law, but this was defeated, and no changes were made. The defeat of the bill is explained by a newspaper favoring the license system in the following paragraph:

"The truth is that the majority of our lawmakers were opposed to the license idea, and no amount of burnishing would make it acceptable to them. They looked on license as evil and unwise, and if necessary were willing to stand between it and the possible desires of a majority of voters in favor of it."

The appropriations provided for expenditures amounting to \$1,510,000. The salaries of members amounted to \$47,025. The State tax was fixed at 15 cents, and the State school tax at 10 cents.

A bill amending the charter of the Vermont Central Railway in regard to claims that the road must pay, having the effect to include claims for grain destroyed in the Ogdensburg elevator fire, was vetoed by the Governor, but was passed again by a vote of 163 to 5 in the House and 21 to 5 in the Senate.

A bill to establish a forestry commission to take charge of park lands that may be deeded to the State was amended by authorizing the Governor and the Secretary of State to take charge of such lands.

A proposal to grant municipal suffrage to tax-paying women was lost in the Senate by a narrow margin.

An old statute requiring that any one running a steam vehicle on a public road shall send a messenger a half mile ahead to give warning of its approach, in order to prevent accidents, was repealed.

The preceding Legislature made provision for the appointment of a committee to investigate the matter of double taxation, and its report was presented this year. It showed the negligence or collusion of appraisers in listing property for taxation, and detailed some of the schemes resorted to for evading taxation.

A bill was passed to prevent fraudulent conceal-

ment of property from taxation, and another authorizing the State Commissioner of Taxes to investigate the present system of taxing corporations and report with recommendations to the next Legislature.

The Senate passed a bill to abolish capital punishment, but the House refused it a third reading by a vote of 118 to 107.

Among the measures were the following joint resolutions:

Asking Congress to take some recognition of the distinguished services of Capt. Charles E. Clark of the United States battle ship Oregon during the Spanish-American War.

Providing for a portrait of Capt. Clark for the State.

Providing that the week beginning with the third Sunday in August each year be known as "Old Home Week."

Providing for a portrait of Gen. Emerson H. Liscum to be placed in the State Capitol.

A special committee was appointed on the erection of a memorial tablet marking the birthplace of President Chester A. Arthur.

Other measures were:

Reorganizing the militia and consolidating the offices of quartermaster general and adjutant general.

Prohibiting the selling or giving of cigarettes to minors.

To prevent imitations of dairy products.

Providing for traveling libraries.

To protect gray squirrels.

Allowing women to act as notaries public.

Permitting appointment of women to certain town offices—treasurer, superintendent, librarian.

Giving physicians the right to quarantine infectious diseases.

Establishing a State laboratory.

Providing for geological work.

Appropriating \$13,951 for repairs at Waterbury Asylum and \$4,000 for Brattleboro Retreat.

Removing the words "or mentally" from the act allowing a voter to be assisted if he is physically or mentally unfit to prepare his ballot.

The Legislature elected Hamilton S. Peck Judge-Advocate General and W. H. Gilmore for the combined offices of Adjutant General and Quartermaster General, and the Senate confirmed the Governor's nominations of J. O. Sanford to be State Highway Commissioner and Judson E. Cushman State Tax Commissioner. Dr. W. J. Huntington was made Surgeon General, and Charles J. Bell, Ernest Hitchcock, and George Aitken were made members of the Board of Agriculture.

Political.—The State election took place Sept. 4. Tickets were put out by 4 parties.

The Republicans held two conventions, the first, April 18, in Burlington, to choose delegates to the national convention. They were not instructed for President McKinley, but his administration was approved. In regard to the island possessions the resolutions said: "We unhesitatingly proclaim our conviction that from over no inch of this newly acquired territory, where the Stars and Stripes have floated, carrying their promise of enlightenment and freedom, should that flag be lowered or that promise be withdrawn."

The second Republican convention met in Montpelier June 27, and named the following candidates: For Governor, William W. Stickney; Lieutenant Governor, Martin F. Allen; Treasurer, John L. Bacon; Secretary of State, Fred A. Howland; Auditor of Accounts, Orion M. Barber; Presidential Electors, Truman C. Fletcher, Horace F. Graham, George E. Fisher, Fred G. Fleetwood.

The platform contained no definite declarations on State issues.

The Democratic convention met in Montpelier June 14, elected delegates to the national convention, and made nominations for State officers and presidential electors. The resolutions contained the following declarations:

"We demand a tariff for revenue only, to take the place of the present Dingley tariff; denounce the creation of corporate trusts; demand the urgent enforcement of all antitrust laws; reiterate our faith in the larger benefits to be derived from bimetallism as compared with monometallism; demand the restoration of silver to its original and natural place as a redemption currency, and indorse the principles of the Chicago platform of 1896.

"We favor home rule for the Filipinos under the protection of the United States; we demand absolute free trade between Porto Rico and all parts of the United States; the independence of Cuba; no subject peoples; no colonial dependencies.

"We express our cordial sympathy with the cause of the Boers; we favor an income tax; the election of United States Senators by direct vote of the people; the immediate construction of the Nicaragua Canal under the control and protection of the United States."

The ticket follows: For Governor, John H. Senter; Lieutenant Governor, E. S. Harris; Secretary of State, H. O. Cummings; State Treasurer, Elisha May; Auditor, C. A. Fitzpatrick.

The Prohibition ticket was: For Governor, Henry C. Barnes; Lieutenant Governor, Charles B. Wilson; Treasurer, Lucien C. Kimball; Secretary of State, Fenimore H. Shepard; Auditor, Frederick A. Collins.

The Social Democratic party made the following nominations: For Governor, James Pirie; Lieutenant Governor, C. H. Barber; Secretary of State, John McMillan.

The Republican candidates were elected, the vote standing: Stickney, 48,441; Senter, 17,129; Barnes, 950; Pirie, 567. There are 30 Republicans in the Senate and 196 in the House; 48 Democrats and 1 Independent in the House. The election was affected to some extent by the question that was to come before the Legislature of substituting local option for the prohibition law. There were but 42 Democrats in the preceding Legislature. At the November election the presidential vote was: McKinley, 42,568; Bryan, 12,849; Woolley, 308; Barker, 367; scattering, 64.

VICTORIA, Queen of Great Britain and Empress of India, born in the palace of Kensington, May 24, 1819; died in Osborne House, Isle of Wight, Jan. 22, 1901. Her father was Edward, Duke of Kent, fourth son of George III, and her mother was Princess Victoria Maria Louisa of Saxe-Coburg-Gotha, whose first husband was Prince Charles of Leiningen. At the time of the birth of the Princess Victoria two sons of George III, older than the Duke of Kent, were still living—the Duke of York, then Prince Regent and afterward George IV, and the Duke of Clarence, who became William IV. William had two daughters, both of whom died in infancy, so that Victoria's father, had he lived, would have succeeded to the throne at the death of William IV. The princess was christened Alexandrina Victoria at Kensington Palace, June 24, and in January of the following year the Duke of Kent died.

The princess was educated under the supervision of the Duchess of Kent and Baroness Lehzen, who had gone to England as governess to Princess Feodora of Leiningen, half-sister of Victoria, and who

became private governess to the Princess Victoria when the latter was five years of age. Up to her ninth year all the princess's education was in German, but at ten years of age she was placed under English masters; Rev. George Davys, whom she made Bishop of Peterborough after her accession, taught her Latin; her master in music was Mr. J. B. Sale; in history, Mr. Westall; in penmanship, Mr. Thomas Seward, writing master of Westminster School. When King George IV died, in 1830, and was succeeded by his brother William, Duke of Clarence, whose wife was Princess Adelaide of Saxe-Meiningen, the Princess Victoria was recognized as heir to the throne. During his reign there was great bitterness of feeling between the King and the Duchess of Kent, the chief cause of which was the refusal of the latter to allow her daughter to pass a part of the year at court. In May, 1837, when the Princess Victoria became of age, the King determined to settle upon her an allowance of £10,000 a year, of which she should have absolute control, although the Duchess of Kent desired to be appointed her daughter's trustee. The King, however, did not live to make the settlement, as he died on May 20.

Immediately on the death of the King, the Archbishop of Canterbury, the Marquis of Conyngham, and Dr. Howley set out for Kensington, which they reached at 5 A. M., and announced to the Princess Victoria the death of the King. The Privy Council assembled at Kensington at 11 o'clock, and the usual oaths were administered to the Queen by Lord Chancellor Cottenham, after which all present did homage. By the death of William IV his brother, the Duke of Cumberland, became King of Hanover, a throne to which Victoria could not succeed because in that state the Salic law prevailed. The public proclamation of the Queen took place on the 21st, at St. James's Palace. The Queen opened her first Parliament in person, and before the close of the year a civil list bill was passed settling £385,000 a year on her Majesty. There was also passed a bill to increase by £30,000 the income of the Duchess of Kent.

The coronation of the Queen took place June 28, 1838, in Westminster Abbey, and Parliament voted £70,000 to be spent for the ceremonial. It was arranged that the sovereign's procession to the Abbey through the streets should be made a finer show than on previous occasions; and it drew to London 400,000 country visitors—an enormous number, considering how few were the railways and how scanty was the hotel accommodation which the capital had to offer. On the night of June 27 more than 40,000 people bivouacked in the streets, and long before daybreak a vast multitude thronged Whitehall and all the streets leading to the Abbey; but order was so well kept that no uninvited person forced his way into the building. The Queen made the passage from Buckingham Palace to Westminster Abbey in the state coach. After her entrance there the Archbishop of Canterbury made the presentation of the Queen to her subjects; after prayers and a sermon by the Bishop of London, her Majesty stood by the altar, and with her hand on the Bible took the oath, afterward kissing the book; then, seated in the coronation chair above the mystic stone of Scone, she was anointed with holy oil, presented with swords and spurs, invested in the imperial robe, and handed the scepter, the orb, and the royal ring; then the Archbishop of Canterbury took the crown from the altar and placed it on her head, and as he did so all the peers and peeresses donned their coronets, and a deafening acclamation of "God save the Queen" arose, to be repeated again and again, while the organ pealed

forth the national anthem. When the tumult had subsided trains of peers ascended the steps of the throne to do their homage—first touching the crown with the right hand, then bending the knee and kissing the Queen's hand.

Within a year the court was brought into sudden disfavor with the country by the political crisis known as the Bedchamber Plot. In May, 1839, the Whig ministry had a majority of only five in the House of Commons upon a proposal to suspend the Constitution of Jamaica, and therefore it resigned. The Duke of Wellington declined the premiership, but recommended Sir Robert Peel, who undertook the task of forming an administration, but was met at the beginning by a difficulty for the solution of which there was no precedent. The whole theory of the parliamentary responsibility of the ministry had been developed since the time of Queen Anne. Peel stipulated, on forming his Cabinet, that the mistress of the robes and the ladies of the bedchamber who had been appointed by the Whig administration should be removed; but to this the Queen would not consent, and she wrote curtly that the course proposed by Sir Robert Peel was contrary to usage and repugnant to her feelings; the Tory leader then had to inform the House of Commons that, having failed to obtain the proof which he desired of her Majesty's confidence, it was impossible for him to accept office. The Whig ministry under Lord Melbourne was recalled, and the Premier declared by resolution in Cabinet that the offices held by ladies in her Majesty's household should be exempt from political changes. The Queen acknowledged later that she had been in the wrong in the matter, and repaired the blunder when the Tories again formed the ministry.

It had been arranged even in the Queen's infancy, by the Duchess of Kent and her two brothers—Leopold, whose first wife was the Princess Charlotte of Wales, daughter of George IV, who died in 1817, and who became King of the Belgians in 1831, and the Duke of Saxe-Coburg-Gotha—that Victoria should marry Prince Albert, younger son of the latter, who was born in the same year as the Queen. Although the arrangement was fully understood and acquiesced in by Queen Victoria and Prince Albert, the Queen wrote to King Leopold in 1839 that she did not wish to marry for some years. A few months later Prince Albert, with his brother, Prince Ernest, arrived in England, and during his visit to Windsor Castle the Queen offered him her hand. On Nov. 23, after the return of the prince to his home, the Queen announced to the Privy Council her intended marriage with her cousin. Baron Stockmar was sent to England in January, 1840, as representative of Prince Albert to settle the treaty of marriage and to make arrangements for the prince's future household. But now the court's quarrel with the Tories in 1839 brought disagreeable consequences. The Queen's announcement of her betrothal was made in the House of Lords on Jan. 16 before a brilliant assemblage of the most eminent people in the land, and it was enthusiastically received. When the Government proposed that Prince Albert should receive an annuity of £50,000 they sustained a severe defeat. An amendment moved by Mr. Hume for reducing the allowance to £21,000 was negatived; but the amendment of Col. Sibthorp—a politician of no great repute—for making the annuity £30,000 was carried against the ministers by 262 votes to 158, the Tories and Radicals going into the same lobby and many ministerialists taking no part in the division. All this mortified Prince Albert exceedingly and gave him a poor idea of the welcome

that awaited him in England. Parliament also withheld the title of Prince Consort until 1857, and this left the rank of Prince Albert uncertain and led to many disputes and mortifications not only in England, but during the royal visits to the Continental courts.

The Queen's marriage was solemnized on Feb. 10, 1840, in the Chapel Royal, St. James's. The one regret of the London people was that a ceremony so fair did not take place in Westminster Abbey; for Holbein's small chapel in St. James's was ill suited for a great display. However, all that was seen or heard of the wedding pleased the people well.

During the Queen's reign several attempts were made on her life. The first was by Edward Oxford, who fired at the Queen as she was driving with Prince Albert up Constitution Hill in an open carriage; the second attempt was that of John Francis in 1842, at about the same place, and was followed about a month later by that of a hunchback named Bean made as the Queen was passing from Buckingham Palace to the Chapel Royal; in 1882 Robert Maclean fired as the Queen was leaving the station at Windsor, and there were other so-called attacks made with unloaded pistols.

Queen Victoria had nine children—four sons and five daughters—namely, Victoria Adelaide, Princess Royal, born Nov. 21, 1840, who married in 1858 the Crown Prince Frederick of Prussia, afterward Emperor of Germany; Albert Edward, Prince of Wales, born Nov. 9, 1841, married in 1863 to Princess Alexandra of Denmark; Alice Maud Mary, born April 25, 1843, who was married in 1862 to Louis IV, Grand Duke of Hesse, and died in 1878; Alfred, Duke of Saxe-Coburg-Gotha, Duke of Edinburgh, born Aug. 6, 1844, married in 1874 the Grand Duchess Marie, daughter of Alexander II, Emperor of Russia, died in 1900; Helena, Princess Christian, born May 25, 1846, married in 1866 Prince Frederick Christian of Schleswig-Holstein; Louise, born March 18, 1848, married the Marquis of Lorne in 1871; Arthur, Duke of Connaught, born May 1, 1850, married Princess Louise of Prussia in 1879; Leopold, Duke of Albany, born April 7, 1853, married in 1882 Princess Helena of Waldeck-Pyrmont, died in 1884; and Beatrice, born April 14, 1857, married Prince Henry of Battenberg in 1885.

The residences most used by the Queen were Buckingham Palace, Windsor Palace, both belonging to the sovereign, and Osborne House, Isle of Wight, purchased by the Queen, who took possession of it in 1843, and Balmoral, in the Scottish Highlands, also purchased by the Queen from the Earl of Aberdeen in 1848.

In March, 1861, the Queen's mother, the Duchess of Kent, died, and in November of the same year the Prince Consort died. Throughout England the death of the Prince was wholly unexpected, and the news caused great surprise and grief. The Prince was buried in the mausoleum at Frogmore, which the Queen had built.

The Prince of Wales's marriage was solemnized at Windsor on March 10, 1863. The public entry of the bride-elect into London on March 7 was a sight which afforded a remarkable display of loyalty and enthusiasm. The Queen witnessed the wedding from the private pew or box of St. George's Chapel, Windsor, but she wore the deep mourning which she was never wholly to put off to the end of her life, and she took no part in the festivities of the wedding. In January, 1864, a son was born to the Prince of Wales, and was christened Albert Victor after both his grandparents.

In 1867 the Queen published *The Early Days of*

the Prince Consort, and in 1869 her diary, *Leaves from the Journal of our Life in the Highlands*, of which a second installment appeared in 1885.

On Feb. 17, 1876, Disraeli introduced in the House of Commons a bill to authorize the Queen to take, in addition to her other titles, that of Empress of India. The proposition was received with disfavor by the Liberals, and excited general disapproval among press and people. It was the subject of long and fierce debates in the house, but was insisted upon and carried through by the ministry. The bill passed the House of Commons March 23, the House of Lords April 7, and received the royal assent April 27, and on April 28 the Queen issued a proclamation assuming her new title. At the time of the passage of the bill in the Commons the Government made pledges that the new title should be used only with regard to Indian affairs.

In 1878 the death of the Princess Alice took place; in 1888 those of the German Emperors William I and Frederick III; in 1884 that of Leopold, Duke of Albany, youngest son of the Queen; in 1892 that of Prince Albert Victor, Duke of Clarence and Avondale, eldest son of the Prince and Princess of Wales; in 1896 that of Prince Henry of Battenberg, husband of the Queen's youngest daughter, who died on board the ship *Blonde* near the West African coast, whither he had accompanied an expedition against the King of Ashanti. In 1899 the grandson of the Queen, the hereditary Prince of Saxe-Coburg, died; in 1900 his father, the Duke of Edinburgh, second son of the Queen, and Prince Christian Victor, son of Princess Christian.

On the occasion of the coming of age of the Queen's sons and the marriages of her daughters Parliament made provision. The Prince of Wales, in addition to the revenues of the duchy of Cornwall, had £40,000 a year, the Princess £10,000, and an addition of £36,000 a year for their children was granted by Parliament in 1889. The princess royal received a dowry of £40,000 and £8,000 a year for life; the younger daughters £30,000 and £6,000 a year each. The Dukes of Edinburgh, Connaught, and Albany were each voted an income of £15,000 and £10,000 on marrying. All these grants were voted under the conditions of the general financial settlement accepted by Parliament at the beginning of the Queen's reign, according to which certain Crown lands were transferred to the nation.

June 20, 1887, was the fiftieth anniversary of the coronation of Queen Victoria, and the country threw itself into the celebration with enthusiasm; large sums of money were everywhere subscribed; in every city, town, and village something was done both in the way of rejoicing and in the way of establishing some permanent memorial of the event. In London the day itself was kept by a solemn service in Westminster Abbey to which the Queen went in state, surrounded by the most brilliant royal and princely escort that had ever accompanied a British sovereign, and cheered on her way by the applause of hundreds of thousands of her subjects. Around her carriage rode her sons and sons-in-law, and some of her grandsons, conspicuous among them being the noble figure of the ill-fated crown prince, afterward the Emperor Frederick, with his son, the present German Emperor. Waiting to receive her Majesty in the Abbey were the ambassadors and ministers of all nations, the peers and the peeresses, the members of the House of Commons, the judges, the most distinguished officers of both services, and a multitude of all that is eminent in every branch of the national life, while grouped together and gazed

upon by every eye stood a representative body of the Indian princes. Other ceremonials connected with the celebration of the jubilee were the opening of the People's Palace on May 14, a review of volunteers on July 2 at Buckingham Palace, the laying of the foundation stone of the Imperial Institute on July 4, a review of 58,000 troops at Aldershot on July 9, and on the 23d a review of the fleet at Spithead, in which 135 vessels of war were gathered together, including 26 armored and 9 unarmored ships, 38 first-class torpedo boats, the same number of gunboats, and 12 troop ships.

In September, 1896, the reign had reached a point at which it exceeded in length that of any other English sovereign; but by her special request all public celebrations of the fact were deferred until the following June, which marked the completion of sixty years from her accession. The prime ministers of all the self-governing colonies, with their families, were invited to come to London as the guests of the country to take part in the jubilee procession; and at the same time drafts from the troops that preserve order in every British colony and dependency were brought home. The programme of the procession was quite different from that of 1887. In the latter case the Queen had driven from the palace to Westminster Abbey, surrounded by the princes of her family; had there taken part in a service which was almost a repetition of the coronation service; and had quickly returned home. On the present occasion her purpose, as officially announced, was "to see her people and personally to receive their congratulations"; and with this intention the route chosen was three times as long, and three times as many persons were thus enabled to offer their greetings to the Queen. The route taken was from Buckingham Palace, along Constitution Hill, Piccadilly, St. James's Street, Pall Mall, and the Strand to St. Paul's Cathedral, where the procession halted while a short service was held on the steps, the Queen not leaving her carriage on account of her lameness. Thence she proceeded to the Mansion House, where she received an address, and then—the great novelty of the day—crossed London Bridge, traversed south London amid crowds as great and enthusiastic as those which thronged the West End, and returned home by way of Westminster Bridge and St. James's Park. Some time later the Queen gave a garden party at Buckingham Palace, and held numerous receptions at Windsor, including that of the colonial troops and that of the members of the House of Commons and their wives. The Queen herself held a great review at Aldershot; but a much more significant display was the review by the Prince of Wales in her behalf of the fleet at Spithead on Saturday, June 26.

In May, 1899, the Queen performed what proved to be her last ceremonial function in London, the laying of the foundation stone of the buildings that were to complete the museum—to be called the Victoria and Albert Museum—which had been planned forty years before by the Prince Consort, and one week later she celebrated her eightieth birthday. In the spring she visited Dublin, where she spent four weeks at the vice-regal lodge. The following autumn her health began to fail, but she continued her usual occupations, and before Christmas journeyed to Osborne, where she died Jan. 22, 1901. The first portion of the ceremonies in connection with the funeral took place on Friday, Feb. 1, when the remains were removed from Osborne and placed on board the royal yacht *Alberta*, which conveyed them across the Solent to Portsmouth harbor. The coffin was carried

out of the house by Highlanders and bluejackets, and placed on a gun carriage adapted as a funeral car. The yacht left East Cowes a few minutes before 3 p. m., and proceeded through a long avenue of saluting war vessels, British and foreign, followed by the Victoria and Albert with the royal mourners on board, and other vessels. The Alberta arrived in Portsmouth harbor shortly before 5 p. m. The members of both houses of Parliament were on board the liners Scot and Dunvegan Castle, which took up positions between some of the war ships. On Saturday, after a short service on board the Alberta, the coffin was carried from the yacht to the train at Gosport, and arrived at Victoria at 11 o'clock. The procession moved by way of Buckingham Palace Road, the Mall, St. James's Street, Piccadilly, Hyde Park from Apsley Gate to the Marble Arch, Edgware Road, and London Street to Paddington station. The route for the whole distance was lined by 33,000 regular troops and volunteers, with police, behind whom had assembled, hours before the time fixed for the passing of the procession, the largest crowds that have ever gathered, even in London. The first part of the procession consisted of troops, including representative detachments of all arms of the service, and also of the navy and marines. Then came the military *attachés* to the foreign embassies, the headquarters staff of the army, the commander in chief, the earl marshal (the Duke of Norfolk), and other high officers of the household, and a large number of the royal aids-de-camp. The coffin was followed by the King, the German Emperor, and the Duke of Connaught riding abreast, and after them the Kings of Portugal and Greece, nearly 40 princes, representing every royal house in Europe, and a long array of ambassadors and other representatives of foreign powers. The march past occupied nearly an hour. At Paddington the coffin was placed in a catafalque prepared for it in the late Queen's railway carriage. The train reached Windsor shortly after 2 p. m. The coffin was drawn by bluejackets—the artillery horses proving unmanageable—to St. George's Chapel, where the funeral service was conducted by the Archbishop of Canterbury and the Bishop of Winchester, and at its close Norroy, deputy to Garter king-of-arms, proclaimed the death of Queen Victoria and the accession of King Edward VII. The interment took place on Monday afternoon at the royal mausoleum, Frogmore. Shortly before 3 o'clock the coffin was brought out of the Albert Memorial Chapel and placed on the gun carriage, and a procession was then formed, composed almost exclusively of the royal, imperial, and princely mourners, which proceeded through the castle precincts and down the Long Walk. The route was kept and lined by troops, behind whom were gathered many thousands of spectators. For a portrait of Queen Victoria, see Annual Cyclopædia for 1897, page 365.

Victorian Reign, Events of the.—The reign of Queen Victoria, as it was the longest in English history, so also was it the most illustrious when judged by the great events that distinguish it, the progress of the nation in power and wealth, the spread of the empire, the advancement in the comforts and conveniences of life, and the achievements of British subjects in the arts, in science, in literature, as well as in vast schemes of business enterprise, in war, and in diplomacy.

Extent and Population of the Empire.—At the beginning of the reign the empire comprised 8,340,000 square miles and had a population of 168,000,000. At the close, the area had increased over 3,000,000 square miles—it was estimated in 1898 at 11,712,170 square miles—and the popula-

tion had reached nearly 400,000,000. The United Kingdom alone had about 25,000,000 population in 1837, and in 1898 the number of inhabitants was estimated at 40,188,927. The population of England and Wales had more than doubled; that of Scotland has almost doubled; but Ireland's has fallen from about 7,500,000 to about 4,500,000; the highest number was reached in 1845, when the population was 8,295,061. The population of London, which was not more than 1,500,000 in 1837, was in 1898 4,504,766 in the registration district, and, including the whole of greater London, 6,408,321.

The British Empire in India and the feudatory states extend over an area of over 1,800,000 square miles, and has a population of more than 287,000,000. The protectorates and spheres of influence in Africa and Asia cover about 2,240,000 square miles, and have a population of over 36,000,000. The various colonies on continents and islands have a total area of 7,550,533 square miles and a total population of 21,657,782. At the beginning of Victoria's reign England was in control of a small territory in the southeastern part of Australia, a little colony at the southern extremity of Africa, part of Hindustan, the Straits Settlements, British Guiana, and British North America. Now the whole of Australia, parts of Borneo and New Guinea, New Zealand, and other neighboring islands, a vastly extended region in India, and a large part of South Africa, with territories on the eastern and western coasts of that continent, are included in the empire. British North America has been enlarged by the southwestern corner and by the islands discovered in the northern sea.

Growth in Revenues and Military Strength.—The public revenues of the United Kingdom have more than doubled during the period under review. The receipts for the year ending March 31, 1898, were £106,614,004, about 83 per cent. of which was from taxation.

The total strength of the armed forces of the Crown was 101,000; it is 920,000. The navy in 1837 consisted of less than 200 wooden sailing ships; at the present time it consists of more than 400 iron-built ships propelled by steam.

Prime Ministers.—When Victoria came to the throne a Whig ministry under Lord Melbourne had been in power four years except for a short period in 1834-'35, when Sir Robert Peel's first ministry was in office. The law then required that a new Parliament should be summoned at the accession of a sovereign; there was therefore a dissolution; the elections reduced the Whig majority, but did not radically alter the position of parties, and Lord Melbourne's administration continued. The Duke of Wellington was then in the House of Lords and wielded great influence as a Tory leader. Lord Brougham and Lord Lyndhurst were the leading debaters in that house. Benjamin Disraeli took his seat in the House of Commons for the first time in 1837 as member for Maidstone. Other names then on the roll of Parliament have since become famous, among them those of Mr. Gladstone, Edward Lytton Bulwer, George Grote, Lord Palmerston, Lord Stanley (afterward Lord Derby), Lord Morpeth (afterward Lord Carlisle), Daniel O'Connell, and Richard Lalor Shiel. Lord John Russell was Home Secretary and leader of the House of Commons; Sir Robert Peel was leader of the Opposition. It was about this time that the party name "Conservative" began to be substituted for "Tory."

Sir Robert Peel's second ministry began in 1841 and lasted till 1846, when the Whigs came in again with Lord John Russell as Premier. He

went out of office in 1852, but resumed it as Earl Russell in 1865, to remain only about eight months, but in the time intervening between his two premierships he was in every Whig Cabinet. The Earl of Derby, who became Prime Minister as a Conservative in 1852, in 1858, and in 1866, remained in office each term but a short time. The Earl of Aberdeen was the head of a coalition ministry from 1852 to 1855. Lord Palmerston's two Whig administrations were from 1855 to 1858 and from 1859 to 1865. Mr. Disraeli, who was Chancellor of the Exchequer under Lord Derby, succeeded him in February, 1868, but near the close of the year gave place to Mr. Gladstone, who had been a Conservative in his earlier parliamentary career. Mr. Disraeli was Premier again in 1874, but in 1880 the Government had become unpopular for many reasons; the wars in Afghanistan and in Zululand and the general state of financial depression, together with the Irish agitation, combined to turn the feeling against the party in power; the Conservatives were defeated and the Liberals had a large majority. The Queen sent for Lord Hartington, and then for Lord Granville; but Mr. Gladstone was the only possibility. The rivalry of the two great party leaders, Mr. Disraeli and Mr. Gladstone, ended with the death of Mr. Disraeli, then Lord Beaconsfield, the following year. Mr. Gladstone was succeeded by the Marquis of Salisbury in 1885, but began his third administration in February, 1886. In August of the same year Salisbury became Premier for the second time; his party was defeated in 1892 and Mr. Gladstone again became Prime Minister. He resigned in 1894, and Lord Rosebery, the Foreign Secretary in his Cabinet, took his place. In 1895 the Government, having been beaten in Parliament, resigned, Parliament was dissolved, and the election resulted in favor of the Conservatives and Liberal Unionists against the home rulers; Lord Salisbury formed a Unionist Cabinet, and was still Prime Minister at the close of the reign.

The Canadian Rebellions.—One of the earliest events of the reign was the rebellion in Canada in 1837. It began with discontent in Lower Canada, where grievances against the Government had been strongly felt for years. The Representative Assembly protested against the arbitrary conduct of the governors, illegal appropriation of public money, and the composition of the Legislative Council, which they desired to have made elective. The Governor issued warrants for the arrest of the leaders of the agitation, and resistance to the arrests led to the breaking out of the rebellion. There was some fighting and bloodshed, but the insurrection was speedily suppressed, though the discontent continued; and Upper Canada also had its grievances. The home Government felt the justice of the complaints, and Lord Durham was sent over to investigate and report on the best measures of reform, with the understanding that he was to have dictatorial powers. The bill which passed Parliament after his departure gave him much less power; he, however, continued to act as if endowed with full authority for reconstruction, in consequence of which he was recalled. But the wisdom of his report was acknowledged and its recommendations adopted. It laid down the lines for government of colonies, which were followed not only for Canada, but for other British colonies, and have proved so eminently successful, giving a large measure of home rule and placing the internal affairs of the colony in the hands of the colonists themselves. His recommendation that the two provinces should be united was carried out in 1840, and the other reforms were gradually introduced. Lord Durham also recommended that

provision be made for the admission of the remaining colonies of North America into federal union with the Canadas whenever their Legislatures should agree upon such union. In 1867 the plan was carried out by the formation of the federation as the Dominion of Canada, in which the North American provinces are united. In 1869 the charter of the Hudson Bay Company expired, and most of its territory was transferred to the Dominion for £300,000. Upon this a rebellion arose in the Red river country, led by Louis Riel, and troops were sent over under command of Col. Wolseley; but before his expedition could reach the Red river country (the Canadian Pacific Railroad did not then exist) the trouble was practically over, owing to a promise of amnesty through Archbishop Taché.

The Rebecca Riots.—These are chiefly memorable for their odd name and the quaint reason for it. They were outbreaks during one of the early years against the toll charges on the roads in Wales, and took their name from a verse in Genesis, where it was said to Rebecca, "Let thy seed possess the gate of those which hate them." The gate, according to the interpretation, was of course the toll gate, and mobs of men dressed as women gathered at night and destroyed the bars and tore up the roads. There was some bloodshed before the rioters were subdued. An inquiry showed that there was reason in the complaints; the large toll charges pressed heavily on the poor people in the country districts; and measures were taken by which the wrongs were redressed.

The Repeal of the Corn Laws.—The grain-protection law, which was the cause of the anti-corn-law agitation that raged for several years, had been passed in 1815. It was a measure in favor of English agriculturists; it practically forbade the importation of foreign wheat till the price of the home-grown had risen to a certain high figure. Subsequently acts were passed establishing sliding scales by which the duty on imported grain was lowered in proportion as the price of the home-grown advanced. Naturally the commercial and manufacturing classes were opposed to this policy, while it was upheld by the landowners and farmers whose products were protected. An Anti-Corn-Law Association formed in London came to nothing, but free-trade principles began to gain adherents, and in 1838 the Manchester Chamber of Commerce sent to Parliament a petition for the repeal of the corn laws. Manchester now became the headquarters of a movement that spread rapidly in the manufacturing and commercial centers, where associations were formed. Charles Villiers was the nominal leader of the free-trade party in Parliament, but Richard Cobden and John Bright are the names most prominently associated with the movement for repeal and the principle of free trade. While the doctrine was making gradual progress the potato famine in Ireland, in 1845, brought matters to a sudden crisis. A demand arose throughout Ireland for the opening of the ports, and the ministry was denounced for not calling Parliament together to pass a measure of relief. Lord John Russell, leader of the Whig party, wrote a letter to his constituents about this time announcing his adhesion to the principles of free trade. Sir Robert Peel, Prime Minister and leader of the Conservative party, was likewise converted to the views of the Anti-Corn-Law League. But his Cabinet was divided on the question, and he offered his resignation to the Queen, who sent for Lord John Russell; but the Whig leader found it impossible to form a ministry, and upon the Queen's request Sir Robert Peel withdrew his resignation; Lord Stanley, who

would not give up his opposition, left the Cabinet; Mr. Gladstone took his place as Secretary of State for the Colonies; and Parliament was summoned to meet Jan. 22, 1846. Meantime the protectionists were not inactive. They declined to believe in any prospective famine, and denounced the proposed measures as a blow at the agricultural interests. It was as a champion of their cause during the discussion of the corn importation bill that Mr. Disraeli made his first brilliant success in Parliament, though he had been a member for nine years; and from this time on he was recognized as a Tory leader. The bill was passed June 26, 1846.

The Chartist Agitation.—Chartism, which took its name from what was called the "People's Charter," arose about 1838, and was a source of agitation for ten years. The charter demanded six reforms—manhood suffrage, equal electoral districts, vote by ballot, annual Parliaments, payment of members, and abolition of the property qualification for representatives. There were noisy meetings and processions; there were riots at Newcastle, Birmingham, and Newport. A monster petition, the size of a cart wheel, was rolled into the House of Commons; it was said to have 1,250,000 signatures. In 1842 another petition with, as was alleged, 3,000,000 names, was brought to the Commons. Newspapers advocating the principles of chartism were established all over the country, and the general poverty and privation among the working classes helped to swell the ranks of the agitators. Feargus O'Connor, the leader of the movement, was returned for Nottingham at the general election of 1847. In 1848, encouraged, or excited, perhaps, by the revolutionary movements on the Continent, the chartists planned a great demonstration. They were to form on Kennington Common and march in military order to present another monster petition to Parliament, and give it one more opportunity to accede peaceably to the demands of the reformers. London was filled with apprehension at the prospect of hostile encounters and bloodshed. But the Duke of Wellington had taken great precautions for guarding the public buildings and protecting all parts of London. Nearly 200,000 persons, it is said, were sworn in as special constables, one of whom was Prince Louis Napoleon, afterward the Emperor Napoleon III. Their services were not needed, however; the demonstration fell far short of what had been expected; the petition had not nearly so many signatures as had been claimed; the gathering was comparatively small, and composed in large part of mere onlookers; the procession was not formed, for O'Connor insisted on obedience to the order of the authorities; and chartism died out. Some of the reforms it called for have since been effected.

Wars with the Afghans.—In 1838 England declared war against Dost Mohammed, ruler of Cabul, who had attacked her ally, Runjeet Singh. Shah Soojah-ol-Moolk had a hereditary claim to the throne, and England proposed to restore it to him. British troops were sent into the country in 1839, and in 1840 Dost Mohammed surrendered and Shah Soojah was installed. But, Nov. 2, 1841, the greater part of the troops having been withdrawn, the Afghans in Cabul rose against the British and murdered their representatives. The natives attacked the English in their forts with success. Sir W. Macnaghten was in charge, and when the situation seemed hopeless he received a proposal from Akbar Khan, a son of Dost Mohammed, who led the Afghans, that they two should form a secret alliance, should combine against the other chiefs, and keep Shah Soojah on the throne

as nominal ruler, with Akbar as his Vizier. Unfortunately, the base proposal was listened to, and an agreement made to treat on these terms; but when, accompanied by three of his officers, the English representative went out to a conference with Akbar Khan and his company, he was treacherously slain, one of the three officers was killed, and the other two taken prisoners. Notwithstanding this, Gen. Elphinstone treated with the Afghans and accepted their terms, which were the withdrawal of the British from the country, leaving behind all their treasure and all their guns but six, which were allowed them for their protection in their winter journey through the wild country that had to be traversed and amid the murderous savages that beset the way. It led through the great dark gorge known as the Koord Cabul pass. The army consisted of about 4,000 fighting men, of whom a small proportion were Europeans; of camp followers there were about 12,000, including many women and children. Gen. Elphinstone and two other officers, with the women and children, were taken from the army on the march by Akbar Khan, to be kept as hostages. Of the remainder of the 16,000, only one came through alive—Dr. Brydon.

Gen. Sale, commander of the garrison at Jelalabad, refused to be bound by the terms of the forced treaty; he held his post against a siege by Akbar Khan, and when he was certain that re-enforcements were coming through the Khyber pass under Gen. Pollock he went out to battle and defeated the besiegers. Other successes followed, and those of the hostages taken by Akbar Khan that were alive were rescued. Gen. Elphinstone had died. Lord Ellenborough, who had in the meantime become Governor General, issued a proclamation announcing that the British Government would make no further attempt to interfere with the Afghans in their choice of a sovereign. Shah Soojah, who had not been popular with the people, had been assassinated, and Dost Mohammed was restored to power in Cabul.

Another Afghan war broke out in 1878, nearly forty years later. Russia seemed to be intriguing with Shere Ali, son of Dost Mohammed and ruler of Cabul. A special mission was sent by the Indian Government to induce him to allow a British resident to remain at his capital. Shere Ali refused to receive the embassy, which numbered about 1,000 men. Troops were then massed on the frontier and Shere Ali placed a force in the Khyber pass. The Indian Government, therefore, under instructions from England, required an apology and the reception of a permanent British mission in his territory, and he was notified that unless he replied satisfactorily his intentions would be considered hostile and he would be treated as a declared enemy. He made no satisfactory reply and hostilities were begun, Gen. Roberts commanding the British forces. The Russian embassy was withdrawn at the request of the British with the statement that there was no ground for the belief that the Russian Government had influenced Shere Ali to reject the British embassy. The Afghans made little resistance; Shere Ali fled from Cabul, and soon after died. His son and successor, Yakoob Khan, signed a treaty at Gandamak, May 5, 1879, agreeing to admit a permanent British resident at Cabul; his foreign affairs were to be conducted under advice of Great Britain, and he was to be protected from foreign aggression. The British authorities were to have complete control over the Khyber and Michnee passes, and the frontier was settled in a way not disadvantageous to Great Britain. The Ameer was to receive £60,000 a year so long as the treaty

was observed. But on Sept. 3 the British residency was attacked by mutinous troops; Sir Louis Cavagnari, the British envoy, with most of the others at the residency, was murdered. The Ameer represented that he was not responsible for the outbreak, but he was sent as a prisoner to India after the British troops had again taken Cabul, at the close of the year. Abdurrahman Khan was placed on the throne in July, 1880, and received an annual subsidy of 1,200,000 rupees, which has since been increased to enable him to hold his territory independently. A British garrison held Candahar.

When the new Government came in it was announced that the troops would be withdrawn from the country. Lord Beaconsfield protested against the Government "doing everything they could to inform every being in Central Asia, and in every other part of Asia, that they meant to cut and run from the scene of a splendid conquest." Following the British withdrawal there was a rebellion by Ayoob Khan, in which the English troops did not interfere; he was finally defeated, and Abdurrahman kept the throne.

In 1883 Russia made some advances in the neighboring country, and Great Britain thereupon took measures to have the frontiers defined; this was followed by more or less alarm in regard to the designs of Russia before the delimitation was accomplished. There was some trouble with the Ameer in 1893-'94, and the boundary between the British possessions and Afghanistan was more definitely settled. Various hill tribes on the frontier have been subdued in recent years; the public attitude of the Ameer has been neutral during these wars.

Relations with China.—The Opium War began in 1839 with the confiscation by the Chinese authorities of a large quantity of opium brought into China, contrary to Chinese law, by English traders, who bought from the East India Company the opium grown in India. The superintendents appointed by the English Government to have charge of the commerce between the countries gave no aid to the Chinese authorities in their efforts to stop the illicit traffic, and the Chinese believed that the British Government intended to protect it. Announcement was made, however, that her Majesty's Government would not protect British subjects in violating the laws of any country with which they were trading, and that they themselves must bear any loss they might meet in consequence of such acts. Notwithstanding this, the Government honored the request the chief superintendent made after the opium was seized for as many ships as the Governor General of India could spare. Ships were sent, the island of Chusan was taken, Ningpo and Amoy fell, and the British troops were before Nanking when the Chinese, who had fought bravely, saw that resistance was useless and sued for peace. By the treaty, in 1842, the island of Hong-Kong was ceded to England, five of the chief ports were thrown open to British traders, and the right to establish consuls in them was conceded. An indemnity of £4,500,000 sterling was exacted, besides £1,250,000 to the merchants for the destroyed opium.

A second Chinese war broke out in 1857, in consequence of the seizure by the Chinese authorities of the *lorcha Arrow*, a small boat or cutter, in October, 1856, on a charge of piracy. The owners claimed that it was a British vessel, and it was so registered; but the registration had been fraudulently obtained. The *Arrow* was a Chinese vessel. Nevertheless, the cause of the owners was taken up by the plenipotentiary at Hong-Kong, Sir John Bowring. At his demand the Chinese Governor

of Canton, Yeh, sent back the men that had been taken from the boat, and promised that in future care should be taken not to interfere unlawfully with British vessels; but he would not offer an apology, which was demanded, for the case of the *Arrow*, because he maintained that it was not properly a British vessel. Then Sir John Bowring ordered the bombardment of Canton by the English fleet, and Gov. Yeh retaliated by offering a reward for every head of an Englishman. A motion censuring the acts of the British representatives in China was defeated in the House of Lords by a vote of 146 to 110; a similar motion was carried in the Commons by 263 to 247. The treaty of Tientsin was concluded after the British had taken the Taku forts (1858); it granted an indemnity of £4,000,000 and a reduction of transit dues. The treaty was violated in 1859, when, after some further hostilities, it was ratified. During these hostilities, in which France took part, the summer palace was pillaged and burned, destroying property, Gen. Gordon said, that could not be replaced for £4,000,000; there were over 200 buildings, and the grounds covered an area 8 by 10 miles in extent. The destruction was in retaliation for the murder of Englishmen. It was soon after this that Major Gordon, "Chinese Gordon," assisted the Chinese Government in putting down the Tai-ping rebellion.

In 1875 relations with China again became strained in consequence of interference with travelers and the murder of one on the frontier, and a convention was entered into which guaranteed the right of foreign travelers to protection. In 1886 England seized Port Hamilton at the time when a war with Russia seemed imminent, but restored it the following year on demand of the Chinese Government. In later years the demand for concessions has occasionally brought about trouble between representatives of the nations. The events of the year 1900 are given elsewhere in this volume.

Relations with France.—The friendly relations between France and England were more or less disturbed several times during the reign. Once was in connection with the intrigues of Louis Philippe to bring about the "Spanish marriages" which were to give to France virtual control of Spain. The first project was to marry the two sons of Louis Philippe to the young Queen Isabella and her sister; but this was too sure to bring about trouble with other powers, and so the marriage with the Queen was given up, but the other took place in 1846; at the same time the Queen was married to the Duke of Cadiz, the choice also of the French King. This was deemed an act of perfidy on his part, as he had declared to Queen Victoria that he "would not hear of" his son's marriage to the Infanta.

Another incident that raised unfriendly feeling between the two countries was that of Queen Pomare, of the island of Tahiti, who appealed to England for protection when her island was seized by a French admiral in retaliation for some indignity shown to French residents by her subjects, with whom the protectorate of France which she had accepted was unpopular. There had been feeling in England at the time when the protectorate was forced upon the island. Now the indignation was heightened by the seizure of a missionary. Mr. Pritchard, who acted as British consul; he was only released on condition of his instantly leaving the island. After some months of negotiation the affair was settled, 1844, by the payment of an indemnity to Mr. Pritchard by France.

Louis Napoleon lived in obscurity in London from 1837 to 1840, and again from 1846 to 1848.

There lived, too, for a time, the Italian Orsini who formed the conspiracy to murder the Emperor, with a view to removing what he believed to be the influence that kept England from interfering to release Italy from Austrian rule. It was believed in France that the plot was arranged in England; the bombs thrown by the plotters, which killed 10 persons and wounded 156, were made in Birmingham. The French were very angry, and accused England of harboring conspirators and murderers. The French Minister for Foreign Affairs sent a dispatch asking if England considered that hospitality was due to assassins. The English people were likewise excited, and the fact that Lord Palmerston made no reply to that insulting dispatch, but brought in a bill to suppress conspiracies to murder, gave the impression that he was currying favor with Napoleon, and that "the very right of asylum which England had so long afforded to the exiles of all nations was to be sacrificed at the bidding of one who had been glad to avail himself of it in his hour of need." The result of the feeling aroused by this episode was the fall of Lord Palmerston's ministry, which just before had seemed secure in the favor of the people.

Louis Napoleon once more found a refuge in England after the disasters of the Prussian War and the loss of his throne, and he died there as had Louis Philippe more than twenty years earlier on his abdication, in consequence of the revolution that opened the way of the third Napoleon to power.

In 1860 a commercial treaty was concluded with France, by which some duties were removed and others greatly reduced.

When Louis Napoleon set up the empire in Mexico during the war of secession, England, which had united with him in a movement ostensibly to obtain satisfaction for certain claims against the Mexican Government, withdrew when his designs became evident. During the Franco-Prussian War the sympathies of the English people appear to have gone over to the French after their reverses, with the idea that Prussia was dealing too hardly with a fallen foe.

Great Britain and France entered into a controversy over their respective rights in East Africa about 1890. England obtained from Germany and Italy recognition of her right to the whole valley of the upper Nile as coming within her sphere of influence. France protested, and the diplomatic correspondence that ensued ended in the withdrawal of France from the post she had taken on the Nile. This was the much-discussed "Fashoda incident."

The alliances with France in the Crimean War and the troubles with China are spoken of elsewhere in this article.

Relations with Greece.—An Athenian mob in 1847 came very near involving England in war with France and Russia. The name of Don Pacifico, a Jew and British subject living in Athens, became a familiar word in Europe, though there was nothing remarkable about Don Pacifico except the exalted value which he placed upon his household effects. In that year orders were given in Athens prohibiting the usual Easter entertainment of Christians, consisting of the burning of an effigy of Judas Iscariot. The disappointed Christian mob, by way of consolation, wrecked and robbed the house of Don Pacifico, which stood near the place where the effigy was usually burned. He appealed to the Greek Government for compensation, placing his loss at £32,000. Among the items was a bedstead and its belongings which occupied a large place in the discussions of the sub-

ject. He valued the bedstead at £150, the sheets at £30, the coverings at £25, and a pillowcase at £10. About the same time another British subject, Mr. Finlay, made a claim against the Greek Government for some of his land which had been taken for the King's grounds; he had declined to accept the price offered. Further, a British midshipman had been arrested by mistake at Patros, and there were complaints from some subjects of the Queen in the Ionian Islands, which had been placed under a British protectorate by the treaty of Vienna. The English Government in 1850, by Lord Palmerston, who was the Foreign Secretary, made the claims a national demand, and as the Greek Government did not respond, the British fleet was ordered to the Piræus and seized all the Greek vessels found there. France and Russia protested, but Palmerston replied that it was a question between Greece and England. In time, however, the Government accepted an offer from France of arbitration; but this was not successful, and a difficulty arose which caused the withdrawal of the French minister from London, and the peace of Europe seemed to be in danger. At length, however, England yielded, and the claims were arbitrated, Don Pacifico receiving something over £1,000. The incident is noteworthy for the celebrated speech Lord Palmerston made in defense of his policy. The House of Lords passed a resolution which was in effect a vote of censure; in the Commons a resolution commending the action of the Government was passed after a debate of four days, in which Mr. Gladstone, Mr. Cobden, Mr. Disraeli, Mr. Sidney Herbert, and Sir Robert Peel took part against Lord Palmerston, and Mr. Cockburn, afterward Lord Chief Justice, spoke in favor of his action. Lord Palmerston's speech lasted about five hours, and his victory probably had much to do with his subsequent elevation to the premiership. He assumed that the question was whether England should protect her subjects wherever they might be or should leave them defenseless to foreign oppression. He said in conclusion: "I therefore fearlessly challenge the verdict which this house, as representing a political, a commercial, a constitutional country, is to give on the question now brought before it—whether the principles on which the foreign policy of her Majesty's Government has been conducted, and the sense of duty which has led us to think ourselves bound to afford protection to our fellow-subjects abroad, are proper and fitting guides for those who are charged with the government of England; and whether, as the Roman in days of old held himself free from indignity when he could say *Civis Romanus sum*, so also a British subject, in whatever land he may be, shall feel confident that the watchful eye and the strong arm of England will protect him against injustice and wrong."

The debate is also memorable as being the last in which Sir Robert Peel engaged. Going home from a ride in the park on the afternoon of the day when the division was taken, he was thrown from his horse, which shied in sudden fright, and after two or three days the injuries he had sustained resulted in his death.

In 1858, when Sir Edward Lytton was Secretary for the Colonies, Mr. Gladstone was appointed Lord High Commissioner to the Ionian Islands, the people of which had become restless under the British protectorate and desired union with the kingdom of Greece. The effect of the appointment, as described by Mr. McCarthy, is interesting: "The appointment created much surprise, some anger, and a good deal of ridicule at home. Sir Edward Bulwer Lytton had alluded in his dispatch to Mr.

Gladstone's Homeric scholarship, and this was, in the opinion of some politicians, an outrage upon all the principles and proprieties of routine. This, it was muttered, is what comes of literary men in office. A writer of novels [Mr. Disraeli] is leader of the House of Commons, and he has another writer of novels at his side as Colonial Secretary, and between them they can think of nothing better than to send a man out to the Ionian Islands to listen to the trash of Greek demagogues merely because he happens to be fond of reading Homer." The mission was unsuccessful, not from want of effort on the part of the commissioner, but because the islanders had set their hearts on union with Greece and did not care for any adjustment of their grievances against England. He drew up for them an elaborate system of constitutional government, but all they wanted of him was to send to the Queen their petition for release.

On account of the pledges made by the protecting powers and on the advice of England, the second son of the King of Denmark was elected in 1863, and has since reigned as George I. Then England gave over the islands, and they became part of the kingdom.

The Great Exhibition.—The idea of the great exhibition of 1851, if it did originate with the Prince Consort, was taken up by him and owed to him its realization. It was carried out in the face of much opposition. The popular notion appears to have been that England would be overrun with foreign thieves, revolutionists, and all sorts of rogues, and a prophecy to that effect was made in the House of Commons, while in the House of Lords Lord Brougham supported a petition against allowing the use of Hyde Park for such a purpose. Prince Albert was accused of a design to bring in foreigners to the subversion of English manners and morals. The prince persevered notwithstanding, and carried the project to complete success. The idea of the glass building was suggested by Mr. (afterward Sir) Joseph Paxton, head gardener on the Chatsworth estate of the Duke of Devonshire. The exhibition was open one hundred and thirty-eight days, and was visited by 6,007,944 persons. The profits amounted to £150,000; they were devoted to the establishment and endowment of the South Kensington Museum. The buildings of glass and iron were removed to form the Crystal Palace at Sydenham, which was opened in 1854. None of the doleful prophecies were fulfilled. The crowds were orderly and gave no trouble. Undoubtedly the exhibitions of foreign manufactures were of value as enlarging the ideas of British manufacturers, and it is probable that something of the insular terror of foreigners was driven from the minds of the common people. But the expectation that seems to have been entertained that the great exhibition was to usher in an era of brotherhood among the nations of Europe and a reign of universal peace has been cruelly disappointed. The history of the last half of the century is filled with one long series of wars in Europe, Asia, Africa, and America.

The Crimean War.—The first great war of the reign was that in the Crimea, between Russia on the one side and England, France, Turkey, and Sardinia on the other; Sardinia joined the allies in January, 1855. It began in 1854 and ended practically with the fall of Sebastopol in September, 1855, though the treaty of Paris was not made till March 30, 1856. The ostensible subject of quarrel between Russia and Turkey was the desire of Russia to protect the subjects of the Turkish Empire belonging to the Greek Church. But the real object of the Czar was supposed to be the extending of his dominions to Constanti-

nople. Indeed, the Emperor Nicholas had very frankly laid before the English Government a plan for dividing between them the territories of "the Sick Man" when the end should come. Napoleon III was anxious for a foreign war, to turn the attention of his people from affairs at home. July 3, 1853, two divisions of the Russian troops crossed the river Pruth to take possession of the Danubian principalities; war was declared Nov. 1, and Nov. 30 the Turkish fleet was destroyed in the harbor of Sinope, on the southern shore of the Black Sea. This event produced a great feeling in England against Russia, and the popular sentiment was for war. There was a large peace party, however, and the Prime Minister, Lord Aberdeen, did his utmost to avoid war. Lord Palmerston, Foreign Secretary, resigned because the Cabinet would not consent to a strong course against Russia; but they yielded, and he resumed his place. France and England demanded that the Emperor of Russia should withdraw from the territory of the Porte, and declared their intention to use force if necessary to compel him; they sent fleets to the Black Sea, and war was declared in February, 1854. Lord Raglan was placed in command of the English forces, and the invasion of the Crimea was decided upon. The allied English and French forces landed at Kalamita Bay in September, and gained a victory in the first battle, Sept. 20, at the passage of the Alma river. The victory was not followed up, and the exultation over it in England was very soon followed by indignation against the authorities when it became known that the army was wretchedly provided for. The hospitals were not properly organized, stores of food and medicine were spoiling in places where they could not be procured for use, and cholera was carrying off the men. The Russians used the interval after the battle of the Alma to protect the entrance to the harbor of Sebastopol by sinking 7 ships there, thus making speedy capture of the stronghold impossible. The allies went on to Balaklava, where the Russians attacked them, Oct. 25, and were repelled. In this battle occurred the famous charge of the Light Brigade, celebrated by Tennyson. Of the 607 men who made the charge in obedience to the strangely mistaken order, only 198 returned alive. Another attack the following day was likewise repelled. The battle of Inkerman, the hardest of the campaign, was fought Nov. 5, and was another victory for the allies; the Russian loss was estimated at 12,000.

When news of the wretched management of army supplies reached England a motion for a committee of inquiry resulted in a defeat of the Government, and Lord Aberdeen was succeeded by Lord Palmerston. The popular indignation, for some inscrutable reason, was at first turned against Prince Albert, and the most absurd charges of being in collusion with the enemies of England to humble and subdue her were brought against him. The parliamentary inquiry showed the suspicions to be baseless, and the agitation ceased. Some of the instances of mismanagement that came to the knowledge of the people at home during the winter sound strangely familiar. "Shameful frauds," says Mr. McCarthy, "were perpetrated in the instance of some of the contracts for preserved meat. Great consignments of boots arrived, and were found to be all for the left foot. Mules for the conveyance of stores were contracted for and delivered, but delivered so that they came into the hands of the Russians. Medical stores were left to decay at Varna, or were found lying useless in the holds of vessels in Balaklava Bay, which were needed for the wounded at Scutari."

The accounts of these things were sent to Eng-

land by the distinguished war correspondent William H. Russell, who was perhaps the first of the modern special war correspondents. It was at this time, too, that Florence Nightingale became famous.

The siege of Sebastopol lasted nearly a year. Emperor Nicholas died March 2, 1855, and Lord Raglan June 28. On Aug. 16 occurred the battle of Tchernaya. The allies attacked the Redan and Malakoff forts without success, June 18; on Sept. 8 the French carried the Malakoff by storm; seeing that the fall of Sebastopol was inevitable, the Russians evacuated it, having first set it on fire. By the treaty Kars, which had been taken by the Russians, was restored to Turkey, and Russia received back the places the allies had taken. The Black Sea was made neutral, the Danube was thrown open to navigation, the integrity of the Ottoman Empire was guaranteed, and the Sultan issued an edict for improving the condition of his Christian subjects. The loss of England by the war was about 24,000 men, of whom about 20,000 died of disease. The French and Russian losses were much greater. The national debt was increased by about £41,000,000.

The Indian Mutiny.—There was trouble in 1843 with the people of Scinde, and some hostilities which ended in the subjugation and annexation of the three principalities comprising that province. The rulers, called ameurs, were pensioned. Sir Charles Napier is reported to have said of the transaction: "We have no right to seize Scinde, yet we shall do so, and a very advantageous, useful, and humane piece of rascality it will be." When Scinde became a British province the Sepoys lost the extra allowances they had had for service in the enemy's country, and therefore mutinied. There were other mutinies among the Sepoy troops upon the annexation of the Punjab in 1849, after the wars with the Sikhs, and again in 1850 there was a mutiny at Govindgar, which was soon quelled.

The great Indian Mutiny broke out in 1857. It was probably due to the alarm with which the natives saw the rapid progress of the British power, but the immediate occasion appears to have been the notion that the cartridges, which at that time the soldiers had to prepare by biting off the ends, were made in paper greased with the fat of cows and hogs. Such use of the fat of the cow would be sacrilege to the Hindu, while the hog was an abomination to the Mohammedan, and to touch it a degradation. The first show of mutiny was made at Barrackpore, where the Sepoys refused to bite the ends of their cartridges, though they had been assured that none of the grease they objected to had been used in them. There were other similar demonstrations. The mutineers were tried, there were some executions, and at Meerut sentence to hard labor for ten years was given to others. The following day they were rescued by their comrades, who fired upon the officers and killed some of the European inhabitants. Then they marched to Delhi and announced their intention to restore the aged King of Delhi to the throne. Bahador Shah, the hereditary ruler, a descendant of Timour, was about eighty years of age and was living in the palace at Delhi, a pensioner of the East India Company. The siege of Delhi, the awful massacre at Cawnpore by the orders of Nana Sahib, and the relief of Lucknow by Sir Colin Campbell followed, and in December, 1858, the rebellion was at an end. Among the English officers who were distinguished in the suppression of the rebellion were Sir John and Sir Henry Lawrence, Sir Henry Havelock, and Sir James Outram. One result of the mutiny was the transference of the administration from the

East India Company (called by the natives "John Company") to the Crown. Lord Canning, who was Governor General during the rebellion, was the first Viceroy of India.

The Indian Famine.—One of the most terrible events of the reign was the great Indian famine that began in 1896—not the first, but the most widespread and disastrous. It is stated that there were 13 famines from 1802 to 1854, with an estimated loss of 5,000,000 lives; and from 1860 to 1879 there were 16 famines, with a loss of more than 12,000,000 lives. This increase is not due to the fact of decreased production so much as to the draining of the resources of the country by taxes. The Government maintains a famine insurance, but from time to time the fund is diverted for military defense on the frontiers, and it has been used in the construction of railroads, which, by bringing in foreign products, discourage native industries and add to the poverty of the people. The irrigation system begun after the famine of 1877 was not completed, and in the drought of 1896 all crops failed. In June, 1897, more than 4,500,000 persons were receiving relief. Large sums were subscribed in Great Britain, the United States, France, Germany, and other countries; the charitable contributions from all sources amounted to nearly £1,750,000. After the drought came the bubonic plague, which broke out in Bombay and spread to other places. The deaths in the Bombay presidency rose to 4,300 a week in October, 1898.

Trouble with Japan.—In 1862 a British subject was murdered in Japan on a road the freedom of which was granted to Englishmen by treaty; the murder was committed by some of the adherents of Prince Satsuma. The Japanese Government was called upon for an indemnity of £100,000, which was paid; and demand was made on Satsuma for £25,000 and punishment of the murderers; he did not respond, and an English fleet under Admiral Kuper went to his capital, Kagosima, to demand reparation. The forts fired upon him, and he bombarded the town, destroying the greater part of it, after which Satsuma yielded.

Insurrections in New Zealand.—The Maoris have from time to time risen against British rule. An insurrection in 1843-'47 was not so serious as one that took place in Lord Palmerston's second administration. The Maoris resented the intrusion of the colonists on lands they regarded as their own, and they fought surprisingly well. In August, 1864, they were subdued, and submitted. There were other outbreaks in 1868 and 1869.

The Rebellion in Jamaica.—The slaves in Jamaica had been freed in 1834, and were afterward apprenticed as laborers. This system was abolished in 1836, as it was shown to be little less oppressive than slavery. In 1839 a motion to suspend the Constitution of the island for five years in consequence of continual disagreements between the Assembly and the home Government came so near to failure that it led to the resignation of the Melbourne ministry, though, in consequence of the Bedchamber Plot (noticed on page 737, this article), they returned to power directly after, and a milder bill was passed. In 1865 an insurrection broke out in the island which was so quickly suppressed that it would scarcely have raised a ripple in England but for the severity with which the participants and those suspected of participation had been punished after the rebellion was over. Edward John Eyre was then Governor of the island. The insurrection, which was little more than a series of riots, was brought about by an attempt to evict some negroes from land which they had improved under a promise that if they would pay the arrears of quitrent due the Crown

they might have the lands rent free. After order was restored a member of the Assembly, against whom no participation in the insurrection was shown, was condemned by an illegal court-martial and hanged because he was believed to have encouraged the blacks by his sympathy and championship whenever their rights were supposed to be in danger. Then, by order of the Governor, homes were burned, men and women to the number of more than 600 were flogged, many under circumstances of hideous cruelty, and 439 persons were executed. Property of the families of some who had been executed was confiscated. The cruelty and injustice of the punishment were strongly condemned in England, though there was a party which maintained that Gov. Eyre was justified. That party was led by Thomas Carlyle—naturally enough, for he had been one of the loudest supporters of the party of slavery in this country, declaring that “the Almighty Maker appointed the nigger to be a servant.” He praised Eyre as “a just, humane, and valiant man, faithful to his trusts everywhere, and with no ordinary faculty of executing them,” and declared that he merited “honor, thanks, and wise imitation (I will further say) should similar emergencies arise, on the great scale or on the small, in whatever we are governing.” Much more surprising are some other names that appear on the same side with Carlyle’s. John Ruskin headed the subscription to the defense fund for Eyre with £100, explaining that he was able to do it by the sacrifice of an intended journey to Switzerland, partly for his health and partly to complete some notes on the geology of the great northern Swiss valley. Charles and Henry Kingsley, Tennyson, Sir Roderick Murchison, the Earl of Shrewsbury, Tyndall, and Earl Manners also contributed to the fund, and the sympathies of Dickens were on the same side. Active on the committee that undertook the duty of prosecuting Eyre and his associates after the Government declined it were John Stuart Mill, John Bright, Thomas Hughes, Goldwin Smith, Herbert Spencer, Frederic Harrison, Francis W. Newman, Thorold Rogers, Prof. Fawcett, Sir Wilfrid Lawson, and others. Carlyle denounced their action as “un-English and disgraceful,” and Ruskin said he was “glad to make any sacrifice to show his much more than disrespect for the Jamaica committee.” Finally, in 1872, the Government paid the expenses of Eyre in the prosecutions the committee had brought against him; all the indictments had been thrown out by the grand juries, though the report of the commission of investigation had condemned the punishments as excessive, barbarous, wanton, and cruel. The representative assembly of the island was then abolished, and the government administered by an appointed governor and council.

War with Abyssinia.—This took place in 1868. A British consul at Massowah, an island in the Red Sea belonging to Turkey, who was appointed in 1848, became a great friend of Theodore, King of Abyssinia, and helped him to quell an insurrection among his subjects, in the course of which the consul was killed. His successor, Mr. Cameron, was warned that his service was not due to Abyssinia. Theodore suspected him of a secret understanding with Egypt, and regarded the attitude of England as unfriendly. He wrote to the Queen asking aid against Egypt, but received no answer. There was even a story that he aspired to marry the Queen, and that as he boasted descent from the Queen of Sheba he did not think his aspirations presumptuous. There does not appear to be any record of such proposals, but for some reason he felt resentful toward the

English, and he took Capt. Cameron and other British subjects and held them prisoners; demands for their release were disregarded, and Sir Robert Napier was ordered to go against him with a force from Bombay. After a difficult march through a mountainous country they reached the capital, Magdala. The natives fought well, but were beaten. Theodore offered to treat, and sent the captives to Napier. The English general would hear of nothing but unconditional surrender; Theodore would not surrender, and his rock-built capital was carried by assault. He was found just within the gate, having died by his own hand. Magdala was destroyed lest it should be used as a stronghold by a fierce tribe of Mohammedans in that region. Sir Robert was made Baron Napier of Magdala, in recognition of his service.

The Treaty of Berlin.—In 1875 an insurrection broke out in Bosnia and Herzegovina against the Turkish Government, which spread rapidly and received aid from Serbia and Montenegro. The Turkish Government appealed to England to prevent assistance from being given to the insurgents from surrounding countries. A note drawn up by Count Andrassy, the Austrian minister, called after his name, became quite famous in the history of the negotiations entered into for the purpose of adjusting the difficulty. In this note Austria, Russia, and Germany joined in declaring that the Turkish Government had failed to carry out its promised reforms, and that the other powers would insist upon immediate fulfillment of them. The note was signed by France and Italy, but not by England until a request came from the Porte that England should sign. Upon receipt of the note promises of immediate action upon the reforms were made, but nothing was done. Then the three powers that had first united in the note drew up what was called the Berlin Memorandum, giving Turkey to understand that force would be used unless the reforms were at once instituted, but England refused to join with them, and the memorandum was not sent. Following this were outbreaks in Turkey; a Mohammedan mob murdered the French and German consuls at Salonica; the Sultan was deposed and committed suicide; his nephew, who succeeded, was deposed three months later and his brother enthroned in his place. Then an insurrection broke out in Bulgaria, and the Turkish troops sent there not only put down the revolt, but proceeded to wholesale massacre of men, women, and children. In the district of Philippopolis 12,000 were killed. The whole civilized world was stirred by the accounts of the “Bulgarian atrocities,” as it was in later years by the Armenian massacres. The indignation in England was intense. Mr. Gladstone led in denunciation of the Turkish Government and the policy of allowing such a power to tyrannize over the Christians in the provinces. But the humanitarian sentiment that called for immediate interference was checked by the chronic dread of Russian aggression. So there came to be a distinct division of sentiment between those who held that Turkey must be sustained as a barrier against Russia and those who believed that the Turk should no longer be allowed to control Christian peoples, since all his promises of reforms had been proved worthless. A conference of the powers at Constantinople effected nothing. In April, 1877, Russia declared war against Turkey, and after some repulses secured victories that seemed to mean final success. A large party in England was for war. It was at this time that the word jingoism came into use as a name for those eager for an aggressive foreign policy. It was taken from the refrain of a song popular in the music halls:

"We don't want to fight, but, by jingo, if we do, We've got the ships, we've got the men, we've got the money, too."

The fleet was ordered to the Dardanelles, but recalled on account of the Liberal opposition and the unwillingness of some members of the Cabinet to be responsible for war. Before further war measures were taken Turkey had yielded, agreed to an armistice and the treaty of San Stefano, which granted independence to Bulgaria and made the other Christian provinces almost independent. Preparations for war against Russia now went on in England, which would not consent to the treaty or allow Russia to dictate terms to Turkey. Lord Derby, the Foreign Secretary in Lord Beaconsfield's Cabinet, resigned—he had been for preserving peace—and Lord Salisbury took his place. War now seemed certain, but Prince Bismarck came forward with a proposal for a congress in Berlin, to discuss the treaty of San Stefano. Lord Beaconsfield and Lord Salisbury represented England. The result was the Treaty of Berlin. Lord Beaconsfield came home in triumph, bringing the island of Cyprus, the price Turkey paid for England's guarantee that she should be left in possession of her territory in Asia. To the crowds that gathered to hear him speak he proclaimed that he had brought home "peace with honor," a phrase that at once became current in England and America. At this time the great Conservative leader touched the highest point of his popularity and Mr. Gladstone his lowest point of unpopularity. Parliament was dissolved in 1880, however; popular feeling had changed; the wars in Asia and Africa were not going well; the elections brought the Liberals back to power with a great majority. The Earl of Beaconsfield died April 19, 1881.

Events in Africa.—British explorers have been very active in Africa during the past half century. In 1849 Dr. Livingstone discovered Lake Ngami, in 1859 Lake Nyassa, and in 1868 Lake Bangweolo; he explored the Zambesi and its tributaries and the Lualaba, and traveled from coast to coast. Capt. Speke discovered Victoria Nyanza in 1858, and the same year, in company with Burton, Lake Tanganyika; and Sir Samuel Baker found Albert Nyanza in 1864; others have followed and filled out the map of Africa in connection with the explorers of other nations. Colonies have been planted and the lines of British protectorates and spheres of influence extended in eastern, western, and southern Africa.

The colonies in West Africa have given trouble from time to time during the reign. In 1863 an expedition sent against the warlike Ashantis had to return on account of the deadly climate. In 1872, after some Dutch possessions had been gained by England through purchase and exchange, the King of the Ashantis refused to evacuate the territory, claiming that tribute was due to him. Sir Garnet Wolseley was sent against him with a force in 1873, defeated him, burned his capital, Kumassi, and forced him to accept the terms of England, which included the prohibition of human sacrifices. In 1895 another expedition was sent against the then King of Ashanti, or of the part that was left of it, Prempeh, who had refused to accept a British resident and had proposed to send envoys to England, refusing to treat with the Governor of the Gold Coast. An ultimatum was sent to him, demanding that slave catching and human sacrifice should be stopped. Denying charges of these things, he talked defiantly, but yielded without resistance when the English reached Kumassi. Lagos was taken in 1851 and formally ceded in 1861, and other adjacent territory has been since annexed.

The British possessions in South Africa were greatly extended during the reign; Natal was added in 1842; British Kaffraria, taken about 1848, was added to Cape Colony in 1866; Basutoland in 1868; Griqualand West in 1872; Griqualand East and neighboring territory in 1874-'75. The Transvaal was annexed in 1877, but restored to the Boers under British suzerainty in 1881.

There were wars with the Kaffirs in 1846 and in 1851-'52, with the Galekas and Gaikas in 1877-'78, and with the Basutos in 1880-'81. Of the wars with native tribes, the most important was that made on the Zulus, about 1879. Under their King, Cetewayo, they seem to have been friendly to the English; but some trouble having arisen with the colonists, arbitrators were appointed who decided that certain disputed territory claimed by the Zulus was theirs by right. But Sir Bartle Frere was made Lord High Commissioner, and he seems to have avoided a settlement with the intention of bringing the Zulu territory under British rule. However this may be, the war was regarded in England as unnecessary. The English army sustained a complete and sudden defeat at Isandlwana, Jan. 22, 1879. The loss was given as 30 officers and 500 men of the imperial troops and 70 men of the colonials, together with the whole train of supplies. There was another serious reverse March 12. In July the Zulus were completely defeated at Ulundi, where they met a loss estimated at 800 to 1,500, while the British lost 10 killed and 53 wounded. Cetewayo was captured in August. Zululand was apportioned among 13 chiefs, but some of them proved to be cruel oppressors, and at length, in 1882, in accordance with the wish of the Zulus and on the recommendation of Bishop Colenso of Natal, Cetewayo was restored under conditions. He was taken to London first, with a view to impressing him with the strength and glory of the English nation. In 1883 he attempted to regain his former sovereignty over territory that had been assigned to another chief. He was wounded, and afterward kept prisoner till his death, in 1884.

An incident of the Zulu War was the death of the prince imperial of France, the only son of Napoleon III and the Empress Eugenie. He had gone out with a reconnoitering party; they were surprised by the enemy, who killed the prince and two troopers with their assegais. The English Government was assailed for having accepted his services, but it was found that the prince had wished to serve in the army, and had been refused by the home authorities, but allowed to go out upon his own account to see something of war, which he was very anxious to do.

The troubles with the Boers of the Transvaal, the aggressions upon their territory, the annexation, the war of 1880-'81, culminating in the defeat of the British army at Majuba Hill—when the British commander, Sir George Pomeroy Colley, who was the Lord High Commissioner for South-east Africa, was slain, with 82 others, and 184 were wounded or captured—and the terms of settlement afterward, have been so exhaustively reviewed during the recent South African War that it is unnecessary to enter into them here. They are given in detail in the articles on CAPE COLONY and SOUTH AFRICA in former volumes of the Annual Cyclopædia. The incidents of the Jameson raid in 1896 and of the war with the Boers which is still in progress are fresh in memory, and need scarcely be alluded to.

About 1839 the Pasha of Egypt, who had conquered Syria, turned his arms against the Sultan, whereupon the English and Austrians went to the rescue of the Turks, bombarded Acre, and forced

the rebellious Pasha to yield. A treaty was signed in 1841 which left him his Egyptian, but took away his Syrian possessions. In 1875 the Government bought the shares of the Khedive of Egypt in the Suez Canal, and Parliament voted £4,080,000 to pay for them. The measure was opposed by Mr. Gladstone and others of the Opposition. The Government explained that they had negotiated the purchase, not as a financial investment, but as a political move for the purpose of strengthening the empire. In 1876 France and England interposed to secure the payment of the debts that had been incurred by the Khedive, Ismail, the interest on the bonds not having been met. The expenditures were placed under the supervision of French and English comptrollers. In 1880 an international Commission of Liquidation was appointed. The debt amounted to about \$500,000,000. The loans had been negotiated with English and French banking houses at from 7 to 9 per cent. interest, yet the Khedive had actually received only about 50 per cent. of the nominal loans, the rest having gone in bankers' commissions and the discount at which they were taken. The annual interest and sinking-fund charges on the nearly £33,000,000 owing in 1870 were about 12 per cent. Crops were pledged in advance and interest mounted; the miserable ruler had to pay as high as 28 per cent. for advances from the Anglo-Egyptian Bank. The poor Egyptians were robbed on every hand. A proposal to reduce the land tax so that the people might live was rejected on behalf of the bondholders. In February, 1879, the unpaid army officers had mutinied. The Khedive dismissed the European ministers, fearing, as he said, a massacre. The English and French governments retaliated by compelling the Sultan to depose him and appoint his son Tewfik to be Khedive in his place. In 1880 the floating debt was converted into bonds, the whole amounting to £105,876,630. The Khedive had used the borrowed money largely on public works, the Suez Canal, the Nile canals, bridges, mills, docks, harbor improvements, lighthouses, waterworks, railroads, and telegraphs; he established public schools and built opera houses and palaces.

The salaries paid to foreign officials was one source of discontent to the Egyptians. From a report made in 1882 it appeared that the total annual salaries to foreigners in public office was 373,491 Egyptian pounds, and this and other grievances gave rise to the so-called National party. It did not seek to deny the obligation of the debt, but complained of the employment of foreigners at great salaries for work the natives would have been glad to do for small ones; of the exemption from taxation of the fine dwellings of Europeans while the poor huts of their neighbors paid 12 per cent. on their valuation.

An attempt at a constitutional government was made, but the Assembly and the Khedive with his counselors were at odds. The French and English sent squadrons to make a naval demonstration, to fortify the authority of the Khedive, which anchored in the harbor of Alexandria. Arabi Pasha, who stood for the National party, was Minister of War. He was forced from the Cabinet, but the Khedive was afterward compelled to reinstate him.

The powers interposed, and it is possible that arrangements might have been made by which the worst abuses complained of would have been done away with, but the resentment of the long-suffering people broke out in a riot in Alexandria. An Arab was stabbed in a fight by a Maltese; the Arabs gathered in mobs and set upon the Europeans, of whom about 70 were killed, while the

number of slain Arabs amounted to over 600. The Europeans fled. The army took possession. The fact that the Egyptian soldiers were throwing up earthworks and mounting guns was made the occasion for action on the part of the British squadron in the harbor, and the city was bombarded July 11, 1882. There was great loss of life among the Egyptians, but the British lost only 6 killed and 28 wounded. Arabi Pasha was expelled from his office as Minister of War and treated as a rebel, but he continued the hero of the army and the people.

A conference of representatives of the powers had been going on for some time, but England continued with preparations for war, and sent out a force under Sir Garnet Wolseley, who arrived Aug. 15. In a month the Egyptians were completely defeated. Arabi and two of his colleagues were sentenced to death as rebels, but the sentence was commuted to perpetual banishment. The army of Egypt was reorganized under a British officer.

The rebellion in the Soudan under the leadership of Mohammed Achmed, known as "the Mahdi," began about 1881. In November, 1883, an Egyptian army under Hicks Pasha was defeated near El Obeid and completely annihilated; not a single European came away alive. Again in February, 1884, Gen. Baker's Egyptian force, marching from Trinkitat to Tokar to relieve the beleaguered garrison there, was attacked near Suakim by a detachment of Osman Digma's Arabs, defeated with scarcely any resistance, and utterly annihilated as a military force, with the loss of nearly two thirds of its numbers. Meantime Gen. C. G. Gordon, known as "Chinese Gordon," had been sent to the Soudan, to report on the military situation there, to take measures for the security of the Egyptian garrisons and the safety of Europeans in Khartoum; also to consider what steps could be taken "to counteract the stimulus which it is feared may possibly be given to the slave trade by the present insurrectionary movements." On the advice of the British Government, Egypt had agreed to give up her possessions in the Soudan except those bordering the Red Sea, and Gen. Gordon was to arrange for the evacuation by the Egyptian troops in the interior, and the restoration of their ancestral powers to the chiefs who had been suspended from them during the Egyptian occupation.

His task of pacifying the Soudan was complicated rather than forwarded by the campaign of Gen. Graham against Osman Digma, in which the Arabs were defeated at El Teb and Tamanieb. Then Berber was taken by the rebels, who were again repulsed at Dongola.

The siege of Khartoum began about March, 1884, but Gen. Gordon found means to send dispatches, in which he asked for help and reinforcements, which he did not receive. After that the town was so closely invested that it was difficult to send dispatches; the siege was maintained for seven months, all the dispatches received during the time showing the desperate need of assistance. This seems to have been delayed because the Government believed that he was not in accord with their policy for evacuating the Soudan. They were severely criticised for their inaction, and have since been held responsible for the sacrifice of Gen. Gordon. The truth seems to be that Mr. Gladstone's Government were not in accord with the general policy of England, which was particularly tangled in regard to the affairs of Egypt. Mr. Gladstone did not recognize the right of the Anglo-Egyptian Government over the Soudanese apparently, and it is possible that Gen. Gordon's proclamation at the beginning of his Khartoum experience that he

would not interfere with the slave trade indicated to the Government that he did not intend to carry out his instructions.

At length, in August, a relief expedition was planned, and reached Egypt, under Lord Wolseley, Sept. 9; but it was a long time before they arrived at the scene of action. An advance body under Gen. Stewart was attacked, Jan. 17 and 19, 1885, and suffered terrible loss. Gen. Stewart was killed, and the force went on under command of Sir Charles Wilson, who came in sight of Khartoum Jan. 28. The flagstaff still stood on the Government house, but Gen. Gordon's flag was gone. Sir Charles therefore returned without going to Khartoum; he was told that the place had fallen through treachery, and that Gordon had been killed. The Mahdi was reported to have died the following June. Subsequent reports showed that there was great suffering during the siege from famine, and that the fall of the city was followed by horrible scenes of pillage and murder. The English expedition, having failed in its mission, was withdrawn. The disorders in the Soudan continued, and it was not until 1899 that the power of Mahdism was finally broken by the defeat of the Arab forces by the army under Lord Kitchener at Omdurman.

Gradually the finances of Egypt have been placed on a better basis, judicial and other reforms have been introduced, and some engineering works of great benefit to the country have been undertaken, and in part carried out.

Affairs of Ireland.—In 1838 the collection of tithes in Ireland, which had been a fruitful source of discontent and had led to frequent severities on the part of the authorities and almost ceaseless struggles on the part of the people, was at length abolished and a tax upon the land was substituted. Daniel O'Connell was the leader of a movement for the repeal of the act of union between Great Britain and Ireland. Great mass meetings were held at various places. "The year 1843," said O'Connell, "is and shall be the great repeal year." A meeting intended to surpass all previous gatherings was appointed to take place at Clontarf, near Dublin, Oct. 8, 1843. The Lord Lieutenant forbade the meeting. O'Connell, who was opposed to violence, yielded, much to the disgust of those of his followers who were prepared to go to greater lengths and make the movement something more than a peaceable protest. O'Connell and some other leaders were tried and found guilty of conspiring to excite disaffection. They were sentenced to imprisonment for a year, and heavy fines were imposed upon several of them. The sentence was not carried out, the House of Lords, on appeal, having reversed the judgment; but the repeal agitation was ended.

The failure of the potato crop in 1845-'46 brought on the great famine in Ireland, in consequence of which the population was reduced by starvation and emigration by about 2,000,000, and the country received a blow from which it never has recovered. It is doubtful if the repeal of the corn laws, which was hastened by the supposed necessity for opening the ports to foreign grain as a relief measure, did not really militate against the prosperity of Ireland, since it was and is mainly an agricultural country, and the protection afforded by the corn laws formed something of an offset to the other disadvantages under which it labored. Be that as it may, some excesses and outbreaks took place about this time, so that Sir Robert Peel thought it necessary to propose another coercion act at the time when the free-trade bill was before Parliament. The latter passed, but the protectionists joined with the Irish party and

the Radicals against the coercion bill; the minister was defeated, and three days later resigned his office and was succeeded by Lord John Russell.

The awful disaster in Ireland—famine and the diseases that came in its train—naturally disturbed the quiet of the country, and the old device of coercion measures was resorted to. The Young Ireland party, which had been in existence for some years, came forward in 1848, and under the leadership of John Mitchel, who edited the *United Irishman*, attempted to raise an insurrection. The Government brought in a bill, which was passed, making it a felony, punishable with transportation, to publish any incitement to insurrection or to offer any resistance to the enforcement of law. Under its provisions Mitchel was arrested and his paper suppressed. He was tried, convicted, and sentenced to fourteen years' transportation. The habeas corpus act was suspended in Ireland; warrants were issued for the arrest of other leaders; they came into collision with the police at Ballingarry, in Tipperary, where, after a slight resistance, they were arrested. They were tried before a special commission; Smith O'Brien and Thomas F. Meagher were sentenced to be hanged, beheaded, and quartered, the punishment for high treason, but the sentence was commuted to imprisonment for life, and all the convicts were transported to Australia.

The Fenian uprising in 1866 was the next chapter in the revolt of Ireland against English rule. The invasion of Canada from the United States was checked by our Government. In March, 1867, a general uprising in Ireland was planned; but a heavy snowstorm interfered with the gatherings of the people, and the attempt failed. A scheme to seize Chester Castle, take possession of the arms there, and invade Ireland with such steamers as could be taken in the port had been betrayed, and the fiasco in Ireland ended the struggle. Large numbers of men were arrested and sentenced to prison. Three men who tried to rescue some prisoners in Manchester were hanged—a policeman having been killed during the attempt—though John Bright and John Stuart Mill, with others, tried hard to save their lives. Another man was hanged for an attempt to blow up Clerkenwell prison for the rescue of some Fenians. The crime failed of its object, but some innocent persons were killed. The habeas corpus act was suspended in Ireland till March 1, 1869. The Fenians made two other feeble attempts upon Canada, and then the movement went to pieces.

One great source of the misery of Ireland and the discontent there was the tenure by which land was held. Farming was the only dependence of the peasantry. The land was owned largely by absentee landlords, who employed agents to collect the rents, and the agents were expected to wring from the tenants the very utmost possible. Hence the rack-rent, and when it failed the eviction. If a tenant improved his land or buildings, the result was that he must pay a higher rent or give up the holding to a tenant who would bid more, and there was no redress. "The greatest concession," says a historian of Ireland, "that Government made for many generations to the misery of the Irish tenant was to pass an act prohibiting evictions on Christmas Day and Good Friday, and enacting that the roof of a tenant's house should not be pulled off until the inmates had left." He says again that from 1829 to 1880 "the country has been governed by the ordinary law for scarcely a single year. Arms acts, suspension of habeas corpus, changes of venue, peace preservation acts, and coercive measures of all kinds succeed, accompany, and overlap each other with melancholy per-

sistence. Roughly speaking, Ireland, from the union to 1880, was never governed by the ordinary law. The union, according to its advocates, was to be the bond of peace and lasting affection between the two countries; it was followed by eighty years of coercive legislation."

The home-rule movement began quietly about 1870, and in 1874 was made an issue at some of the elections—about 60 Irish members being returned as pledged to it. What they asked was an Irish parliament to deal with affairs concerning Ireland only. Mr. Parnell entered Parliament in 1875, and became the leader of the home-rule party, of which Mr. Isaac Butt had been, if not the originator, an active member. A rather ineffective land act had been passed in 1870; the demand now came to be for three things which were called the three F's—fair rent, fixity of tenure, free sale.

About this time (1876-'79) Ireland was threatened through three poor harvests with another famine. Mr. Parnell was joined by other energetic Irish patriots, who organized the great association known as the Land League. Its object was to change the system of land tenure, to abolish landlordism, and enable the peasant to own the land he tilled. There were 1,200 evictions in 1876, over 1,300 in 1877, over 1,700 in 1878, and nearly 4,000 in 1879. Mr. Parnell came to America to raise money for the sufferers, and went back with nearly \$250,000 for that purpose, besides a large amount for carrying on the work of the Land League. A bill for compensating evicted tenants passed the Commons, but failed in the House of Lords.

The Conservative Government went out in 1880, and Mr. Gladstone's ministry came in. It was expected that the Government and the Irish party would work together, but the expectation was disappointed. The Government would not go as far as the Land League desired. The Irish people were advised to refuse to pay rent above a certain valuation, and to refuse dealings with rack-renters and evicting landlords and agents. This form of warfare took the name boycotting—Boycott being the name of the first man against whom it was used. All violence was steadily discouraged by the leaders, but the advice was not always followed by the starving evicted peasants.

The breach between the Government and the Irish party came to a head when the Government brought in a coercion bill; the Irish members resorted to obstruction tactics until the Speaker forbade further debate. The arrest of Michael Davitt just after this was the occasion of the expulsion of a large number of Irish members—36, it is said—who tried to speak against it in the Commons.

Even Mr. Bright was now against the Irish party, and the proposed coercion act was carried. A land act also was passed. It created a land court or courts, to which a tenant might appeal if he thought the landlord fixed his rent too high. This was much criticised, but it has been productive of great good in bringing relief to tenants from exorbitant demands. Mr. Parnell and the other leaders thought it did not go far enough. They advised that no appeals be taken to the land court till after they had been approved by the Land League authorities. Mr. Gladstone had five of them arrested for defiance of law and sent to Kilmainham jail. They put out a manifesto advising tenants to pay no rent till they were released and constitutional rights restored. Crime increased under what Mr. Bright had called "the ever poisonous remedy of coercion." The historian says: "Ministerialists argued that within ten months the mutilation of animals in Ireland had

increased to 47, therefore the liberties of a nation of 5,000,000 should be suspended. They forgot that in the same ten months of the same year there was a total of 3,489 convictions in England for cruelty to animals, many cases of which were of the most horrible kind."

Then, while still the prisoners were at Kilmainham jail, a peace was concluded between them and the Liberals. The agreement was called the Kilmainham treaty. Parnell agreed to act with the Liberal party if provision were made for canceling the arrears of rent that had accumulated against the smaller tenantry, and the coercion act abandoned. It was abandoned, and the prisoners were released.

On May 6, 1882, occurred the horrible crime in Phoenix Park, Dublin—the murder of the Chief Secretary for Ireland, Lord Frederick Cavendish, and the Undersecretary, Mr. Burke. This was a blow to the cause of Ireland. The arrears bill was passed, the franchise was extended to every householder in Ireland, and a land-purchase bill was prepared but not carried through on account of the fall of the Gladstone ministry. The Land League, which had been suppressed, was revived under the name National League. When Mr. Gladstone became Premier again in 1886 he presented a home-rule bill which had the support of the Irish members, but divided his own party and led to another change of ministry. The scandal against Mr. Parnell led to a division in the Irish party in 1890, and a bitter fight ensued between his partisans and those who believed that his continued leadership would be damaging to the cause.

Under the Salisbury ministry another great step was taken recently toward good government by the establishment of a system of local legislation and administration, to take the place of the old scheme of executive control of the affairs of communities through grand juries.

The Australian Federation.—The Australian colonies act was passed in 1850 for the better administration of the Government there. It gave the colonies of New South Wales, Victoria, Van Diemen's Land, and South Australia representative government. Other colonies have been established from time to time and made mainly self-governing. In recent years the colonies have been taking steps toward a federation: the question was submitted to a referendum in the various colonies, and in January, 1899, the premiers met in a new Federal Council to recast the commonwealth bill that was ratified in 1898 in Victoria, Tasmania, and South Australia; and the amended scheme of federation was accepted by five of the colonies.

Relations with the United States.—In the early years of the reign there were several causes of friction between England and the United States. One difficulty arose out of the arrest in New York of a Canadian who had killed an American in the fray over the destruction of the *Caroline*, a steamboat fitted out on the American side of the Niagara for use by the rebels, but which was fired and sent over the falls by loyal Canadians. This was settled when, after the British Government had declared the raid to have been a public act, the Canadian was released. Another complication was caused by the question of the right of search for impressing British seamen and suppressing the slave trade. The *Creole*, a slave ship, had been taken into an English port in the West Indies by the negroes who had mutinied; the authorities had refused to assist the crew, and the negroes had gone free. The northeastern boundary was still unsettled. In 1842 Lord Ashburton, who was known to be friendly to the United States, was sent over as commissioner, and he concluded

with Daniel Webster, then Secretary of State, the treaty that bears his name. The boundary defined by the treaty was regarded as fair to both countries, the United States undertaking to indemnify the States that suffered loss by it, while others gained. The treaty also included a "cruising convention," a clause stipulating that the squadrons on the coast of Africa, while each enforcing the laws of its own nation, should work in co-operation. The cases of the *Caroline* and the *Creole* were disposed of in the treaty; it was made clear that England was not expected to return fugitive slaves, but the extradition of criminals was provided for; in the case of the *Creole* the United States had demanded the surrender of the negroes as mutineers and murderers. The right of impressment was not touched in the treaty, but Mr. Webster wrote a letter to Lord Ashburton, in which he declared that the crews of American merchant vessels would be protected by the flag over them. Thus a war that seemed impending was averted, though the terms of the treaty were violently attacked in Parliament and in the Senate before it was finally ratified.

The northwestern boundary still remained unsettled. The extreme claim of Great Britain was for the line of Columbia river, beginning where it crosses the forty-ninth parallel. The extreme American claim was for the line 54° 40', which was the original claim of Spain. This gave rise to the party cry, "Fifty-four-forty or fight!" But the forty-ninth parallel had been proposed on the part of the United States as a compromise. A treaty was concluded June 15, 1846, between Mr. Packenham for England and Mr. Buchanan for the United States, giving Vancouver Island to Great Britain. The interpretation of some parts of the treaty, which was drawn up in England, was found obscure and was not settled till 1871, when it was referred to the Emperor William for arbitration. The island San Juan de Fuca he decided to belong to the United States.

In 1850 was concluded the celebrated Clayton-Bulwer treaty in regard to a ship canal between the Atlantic and Pacific, by which its neutrality was guaranteed, and each nation bound itself not to obtain or keep exclusive control of the canal, not to construct or occupy any fortifications in its vicinity, or to make alliance with any state for the purpose of having such fortifications made; not to colonize or assume any dominion over any part of Central America; and not to take for its citizens any rights or advantages of commerce or navigation not accorded on the same terms to the citizens of the other.

Treaties for the suppression of the African slave trade were made from time to time, for extradition, and in regard to naturalization and renunciation of citizenship.

At the close of 1854 a little flurry of disagreement arose over enlistments under the foreign enlistment act, authorizing the raising of a foreign legion for service in the Crimean War, and the English minister was sent away from Washington. England apologized, and diplomatic relations were restored.

The most serious difficulties arose in connection with the war of secession. On the sentiment in England at that time it is best to quote an English historian. Justin McCarthy says in his *History of Our Own Times*: "The Southern scheme found support only in England and France. In all other European countries the sympathy of people and government alike went with the North. . . . Yet in France the people in general were on the side of the North. Only the Emperor and the Government were on that of the South. In Eng-

land, on the other hand, the vast majority of what are called the influential classes came to be heart and soul with the South, and strove to bring or force the Government to the same side."

On May 8, 1861, it was announced in the House of Commons that the Government were of opinion that the Confederacy must be recognized as a belligerent power; on May 13 a proclamation of neutrality was issued, warning all British subjects against giving aid in any way to either side. On Nov. 8 occurred the affair of the *Trent*, which caused intense feeling on both sides the Atlantic. Mr. Mason and Mr. Slidell, sent as envoys of the Confederacy to England and France respectively, escaped from Charleston to Havana, where they embarked in the English mail steamer *Trent* for Southampton. The *Trent* was intercepted by Capt. Wilkes in the United States sloop of war *San Jacinto*, and the envoys were seized and carried to New York. The United States Government did not sustain Capt. Wilkes, though popular feeling throughout the country was with him. On demand of the English Government the envoys were released, and the action of the authorities commended itself to the second thought of the American people, when they read Secretary Seward's masterly explanation of the case, in which he showed that the English Government now for the first time stood on a principle for which the United States Government had always contended.

Far more serious was the trouble about the building of Confederate privateers in Great Britain. The *Florida*, first known as the *Oreto*, was built at Birkenhead under the pretense of being designed for the Italian Government, and was allowed to sail, although the American minister, Mr. Adams, had warned the British Government of her real destination. She captured 15 vessels within three months. The *Alabama*, built also at Birkenhead, was launched in May, 1862, as the "290," or the *Enrica*, under pretense of a trial trip, while the American minister was vainly trying to arouse the English authorities to enforcement of international law; and her builders immediately began work on two rams ordered by the Confederate Government, but ostensibly built for French owners. Great Britain was indeed becoming "the naval base of the Confederacy." The Government did not interfere until the rams were ready for starting, when, on Sept. 5, 1863, Mr. Adams sent a last dispatch on the subject to Earl Russell, then in Scotland, containing the sentence since become famous, "It would be superfluous in me to point out to your lordship that this is war." On the 8th it was announced that orders had been given to prevent their departure. In June of this same year Mr. John Arthur Roebuck made a motion in the Commons that the Government be instructed "to enter into negotiations with the great powers of Europe for the purpose of obtaining their co-operation in the recognition" of the Confederacy, and made a speech in favor of it, in which he quoted an interview he had had with Napoleon III, who was most eager to unite with England in recognition; but this was very ill advised and set the house against him, although the majority was strongly inclined toward the South. Mr. Bright answered him in an eloquent speech, and his motion was withdrawn, though not until after news had reached England of the fall of Vicksburg and the National victory at Gettysburg.

No more Confederate ships were built in England, and the question of claims against the Government for the damage done was allowed to rest for the time being. In 1868 it was taken up, and a convention was entered into by representatives

of the governments which was rejected by the United States Senate. Later commissions from the two countries met at Washington, where it was announced that "her Britannic Majesty has authorized her high commissioners and plenipotentiaries to express in a friendly spirit the regret felt by her Majesty's Government for the escape, under whatever circumstances, of the Alabama and other vessels from British ports, and for the depredations committed by these vessels." After laying down some rules in regard to neutrals, the treaty provided for the settlement of the Alabama claims by five arbitrators, to meet at Geneva and to be appointed by the Queen, the President, the Emperor of Brazil, the King of Italy, and the President of the Swiss Confederation. It provided also for a tribunal to settle individual claims between the countries, and a commission to take up the fisheries question; and referred the dispute about the Oregon boundary to the German Emperor. When the arbitrators met they refused to allow all the American claims, and those for indirect losses, which were immense and which raised a storm of indignation in England, were withdrawn. But by unanimous vote England was held responsible for the acts of the Alabama, and a majority found her responsible for those of the Florida and some of those of the Shenandoah. The award was \$15,500,000, and all claims of citizens were disallowed. On the other hand, Great Britain received an award of \$5,500,000 in gold on account of the Canadian fisheries claims.

The trouble about the taking of fur seals in Bering Sea by Canadians and the claim of the United States to exclusive jurisdiction there as coming with the purchase of Alaska from Russia began as far back as 1872, but the United States did not attempt to enforce its rights till 1886, when some schooners belonging to a large fleet from British Columbia were seized and taken to Sitka; but on protest of the British minister the President ordered them to be released, without conclusion of the questions involved. Others were taken in 1887. At the request of the United States the governments interested entered into negotiations in 1888, which were not concluded. Other seizures were made and diplomatic controversy went on till 1892, when, at Secretary Blaine's suggestion, the matter was referred to arbitrators, who met at Paris and delivered a decision contrary to the contention of the United States, Aug. 15, 1893. This made good the claims of the Canadians for damages, and the commission appointed to make the award placed it at \$473,151.26.

The dispute between Great Britain and Venezuela in regard to the boundary between Venezuela and British Guiana came up about 1894. The President sent a warlike message to Congress. In 1895 an extended diplomatic correspondence ensued between the representatives of the two countries which aroused much feeling on both sides of the Atlantic, and war talk was quite current until the matter was referred to a commission.

After gold was discovered in Alaska a boundary controversy arose and commissions were appointed. On Jan. 30, 1897, a treaty was signed providing for the demarcation of as much of the boundary as lies along the one hundred and forty-first meridian.

The Franchise.—The franchise, which had been extended by the reform bill of 1832, was still further extended by a reform bill in 1867. Reform bills had been brought in by Lord Russell without effect in 1852, 1854, and in 1862; and in 1866 Mr. Gladstone introduced one that he had joined with Lord Russell in preparing. On the occasion of the second reading Mr. Disraeli re-

mindful Mr. Gladstone of his opposition to the reform bill of 1832, when he was a Conservative. The speech of Mr. Gladstone, who was then Chancellor of the Exchequer under Lord John Russell as Prime Minister, is regarded as among the best of his speeches. In its conclusion he said: "This bill is in a state of crisis and of peril and the Government along with it. . . . We stand with it now; we may fall with it a short time hence. If we do so fall, we, or others in our places, shall rise with it hereafter. . . . At some point of the contest you may possibly succeed. You may drive us from our seats. You may bury the bill that we have introduced, but . . . you can not fight against the future. Time is on our side. The great social forces which move onward in their might and majesty, and which the tumult of our debates does not for a moment impede or disturb—those great social forces are against you; they are marshaled on our side; and the banner which we now carry in this fight, though perhaps at some moment it may droop over our sinking heads, yet it will soon again float in the eye of heaven, and it will be borne by the firm hands of the united people of the three kingdoms, perhaps not to an easy, but to a certain, and a not far distant victory."

The bill failed and the Liberals went out of office; but the next year the Tories brought in a bill for extending the suffrage which went even further than the one of the preceding year, and further still after it had been through the committee and been modified by Liberals and Radicals. Lord Cranborne described it as "a leap in the dark," a phrase ascribed usually to Lord Derby. In 1868 the borough franchise was slightly extended in Ireland.

In 1884 Mr. Gladstone introduced another reform bill, which was carried. It extended the franchise in the counties to the same extent as that in the boroughs. The rural laborers had not theretofore been considered politically; but a movement of organization among them, begun in 1872 under the leadership of Joseph Arch, had drawn attention to the injustice done in leaving them out of the provisions of the former franchise acts.

A measure to introduce voting by ballot was introduced in 1871, but not passed until 1872, when it was carried as an experiment to continue in force till 1880. The property qualification for members of Parliament was abolished about 1858, and about the same time the civil disabilities were removed from Jews, who were allowed thenceforth to omit from the oath "on the true faith of a Christian."

The House of Lords.—The privilege of voting by proxy was given up by the House of Lords in 1868. Later the Crown was given power to create life peerages, a proceeding which had aroused great opposition when it was proposed about 1858 to bestow a life peerage on one of the judges.

Church Affairs.—The early years of the reign saw the so-called "Oxford movement," which culminated in the withdrawal of John Henry Newman and other scholars from the Church of England to that of Rome and the establishment of the Puseyite, or ritualistic, party in the Church. The interest which the movement awakened and the ability of the converts, and the fact that they came from the great university where they were leaders of thought, no doubt led to a belief in Rome that England was on the verge of a great reaction which would carry her back to the ancient communion; and this belief was perhaps the inspiring cause of a papal bull issued in 1850,

directing the establishment of "a hierarchy of bishops deriving their titles from their own sees, which we constitute by the present letter in the various apostolic districts" in England. Cardinal Wiseman, as Archbishop of Westminster and Administrator Apostolic of the diocese of Southwark, was to be the head of the Church in England; and he issued a pastoral, in which he said: "Catholic England has been restored to its orbit in the ecclesiastical firmament from which its light had long vanished, and begins now anew its course of regularly adjusted action around the center of unity, the source of jurisdiction, of light, and of vigor." Lord John Russell wrote a letter to the Bishop of Durham on the subject, in which he condemned the bull as an assumption of authority in England to give titles representing territorial distinctions. The day following the appearance of the letter was Guy Faux day, and instead of the usual effigies of that famous personage effigies of the Pope and the cardinal were burned all through the country. The excitement led to the introduction of Lord John Russell's "ecclesiastical titles" bill, forbidding Catholic prelates to take titles from names of places in the kingdom under penalties. Although the bill was opposed as petty and bigoted not only by all the Catholic members, but by Liberals like Cobden and Bright and many of the other members, it was passed by a vote of 395 to 63, probably with the feeling that something must be done to satisfy the excited feeling in the country. But the act does not seem to have been enforced, and in 1871 it was repealed.

About the time that the Oxford movement was going on in 1843 occurred the secession of the Free Church of Scotland, which was a revolt against the appointment of ministers by lay patrons. It was led by Dr. Thomas Chalmers. In 1874 the bill for the abolition of Church patronage in Scotland was passed, giving the congregations the choice of their ministers, the point for which the Free Church had contended.

The question of disestablishing the Church in Ireland was brought forward in Parliament in 1865 by Mr. Dillwyn, who moved that the position of that establishment was unsatisfactory and called for the early attention of the Government. Mr. Gladstone's speech admitted that the position of the Irish Church was unsatisfactory, as it ministered to only one eighth or one ninth of those who were taxed to support it, but declared that the Government was not able at that time to deal practically with the question. This speech, showing Mr. Gladstone's hostility to the Irish establishment, caused great excitement and drew upon him the censure of the Church party, who believed that his principle, if carried out, would interfere with the Church in Wales, where the dissenters were in a majority, and might even be pushed still further. Nothing more was done at that time, but in 1868 Mr. Gladstone offered a bill abolishing compulsory church rates, which became a law; and in 1869, the bill abolishing the Irish Church establishment, to take effect in 1871, received the royal assent. A bill for disestablishing the Church in Wales was defeated in 1895.

In 1871 the university tests were abolished, thus permitting students of every faith to enter Cambridge and Oxford on equal terms.

A bill for the regulation of public worship was passed in 1874. Its purpose was to do away with ritualism, which has for years been a disturbing element in the Church. The bill has apparently been a failure.

Various Reforms and Improvements.—Many old abuses not mentioned above have been

done away with during the past sixty years. In 1842 an act was passed forbidding the employment of girls and women in mines and collieries. This was in consequence of the report of a commission which had been appointed upon motion of Lord Ashley, afterward Earl of Shaftesbury, that the subject of such labor might be investigated. The report showed that in many of the mines and collieries these poor women had been set to draw carts and carry loads like beasts of burden. Other acts regulating labor and doing away with abuses have been passed from time to time. Formerly the laws against combinations of workmen were very stringent. Any effort to effect an advance in wages was treated as a conspiracy. Trades unions were not regarded as entitled to the protection of the civil laws and could not prosecute a dishonest member or secure themselves against robbery. Their aims were looked upon as destructive to society; strikes were held to be immoral, without regard to their provocation or purpose. Some outrages on the part of trades unions in Sheffield and Manchester about 1868 led to an investigation, which, while it showed that some of them used intimidation and crime to carry out their projects, the majority were innocent of such methods; and the inquiry led to discussion of the laws, and in time to reforms in them, placing the workmen on a better footing in many respects; in the matter of contracts, where the law had been all on the side of the employer, the employee was placed on an equality with him.

The abolition of the duty on paper was an important reform, as it enabled newspapers to be sold much more cheaply, and thus contributed to the spread of intelligence. The price of a daily paper at the beginning of the reign was 6d. Besides the heavy duty on paper there was a stamp duty and a duty on advertisements. All these were in time removed, the last, the duty on paper, about 1860.

In 1840 the uniform penny rate of postage was established. The postal telegraph went into operation about 1868.

In 1857 an act to make the celebrated Gretna Green marriages no longer possible, provided that a residence of at least twenty-one days in Scotland should be required to make marriages legal.

Prince Albert made strenuous efforts to banish the practice of dueling from the army, and it has gradually disappeared.

The purchase system for commissions in the army was abolished under peculiar circumstances. Mr. Gladstone introduced a bill to do away with it and make promotion depend upon merit; the bill also provided for compensation to officers then holding commissions which they had bought and expected to sell again, and which therefore represented an investment, so that the bill would be an act of confiscation virtually without that provision. It passed the Commons, but the Lords attempted to delay and perhaps defeat it entirely. They passed an amendment to the motion for the second reading which was to the effect that it was better not to take any action until a complete plan for the reorganization of the army could be effected. The Prime Minister thereupon devised a plan for defeating the scheme of the Lords. The purchase of commissions was made legal only by royal warrant, and he advised the Queen to issue a royal proclamation canceling the permission which had been given by the warrants of herself and her predecessors. This she did. The House of Lords had then no option but to pass the bill, as that was the only way to save the provision providing for compensation. The action of Mr. Gladstone in thus overriding the legislative power

by royal prerogative was severely criticised, even by a large section of his own party, to whose principles it was clearly opposed. Flogging in the army was abolished in 1879.

In 1868 a bill was passed in Parliament to do away with public executions, which had long been a source of scandal to the better elements of the population; it had come to be understood that they were only a source of hardening and brutalization to the very class they were intended to impress by terrible warning. Transportation for crime came to an end in 1857, and debtors' prisons had been abolished.

Strangely enough, up to the year 1870 England had no system of national education. There were private schools and church schools and charity schools, but no system of free public education; more than two thirds of the children were without school advantages. In 1870, during Mr. Gladstone's first administration, a bill was brought in by Mr. Forster to establish a system of schools, and after much opposition, not perhaps to the establishment of schools, but to some features of the plan, it was carried, and the present system of board schools was instituted; improvements have been made from time to time.

About 1874 the country was stirred by the revelations made by Mr. Plimsoll in Parliament concerning the practice of sending out seamen in merchant vessels which were unseaworthy but insured, so that the owners were indifferent to their fate, while the law allowed seamen who failed to fulfill their agreements to be sent to prison. A sailor, therefore, who found himself committed to sailing in a crazy vessel had the alternative of risking his life or going to prison. Mr. Plimsoll offered a bill for securing close inspection of ships, which was opposed as too stringent by ship-owners and others; a bill affording temporarily a measure of relief was passed in 1875, and in 1876 its provisions with others were embodied in a permanent act, which was passed.

The great advances in the comforts and conveniences of life, the improvements in methods of travel and communication, the multiplication of machinery, the discoveries of science, the new applications of known scientific principles—all these advantages of the wonderful progress of the past sixty years England has shared with all other civilized nations, and they need only be referred to here.

In the year following Victoria's accession steam communication was established between England and America: the Sirius, the Great Western, and the Royal William crossed the Atlantic. The Cunard line was established two years later. The same year (1837) that Prof. Morse applied to Congress for aid for his electric telegraph, two Englishmen—Wheatstone and Cooke—took out a patent for improvements "in giving signals and sounding alarms in distant places by means of electric currents transmitted through metallic circuit." The first successful Atlantic cable was laid in 1866; now all the oceans are traversed in this way, the Atlantic by 14 lines.

"In 1837-'38," says Alfred Russel Wallace, "I was living near Leighton Buzzard while the London and Birmingham Railway, the precursor of the present London and Northwestern system, was in process of construction; and when the first section was opened to Watford I traveled by it to London third class in what is now an ordinary goods truck, with neither roof nor seats, nor any other accommodation than is now given to coal, iron, and miscellaneous goods. If it rained or the wind was cold the passengers sat on the floor and protected themselves as they could."

The half-centenary jubilee of the first use of locomotives on the road from Stockton to Darlington in 1825 was celebrated at Darlington in September, 1875, under the auspices of the North-eastern Railway Company. The Liverpool and Manchester line had been opened in 1830; the London and Birmingham was first opened throughout in 1838. The Queen made her first journey by rail from Windsor to Paddington in 1842. The London Times says of it: "The master of the horse, whose business it was to provide for the Queen's ordinary journeys by road, was much put out by this innovation. He marched into the station several hours before the start to inspect the engine as he would have examined a steel. But greater merriment was occasioned by the Queen's coachman, who insisted that, as a matter of form, he ought to make believe to drive the engine. After some dispute he was told that he might climb on to the pilot engine which was to precede the royal train, and the good fellow actually did this; but his scarlet livery, white gloves, and wig suffered so much from soot and sparks that he made no more fuss about his rights in after trips. The run to Paddington was successfully accomplished, and the motion of the train was found to be so pleasant that the Queen readily trusted herself to the railway for a longer journey a few weeks later, when she paid her first visit to Scotland."

About this time the mania for railway speculations set in. Vast sums were subscribed for projected lines; in the autumn of 1845 a table published by the Times showed that 1,428 companies had been registered and were pledged to the outlay of £701,243,208. A panic followed. "For a while railway scrip was not only unsalable, but not to be parted with as a gift. Holders of half-paid-up shares resigned themselves to bankruptcy and men who had raved at Parliament for not passing railway bills with sufficient speed leaped with joy when it happened that the project of their particular company was thrown out, thereby enabling the concern to be wound up and the shareholders to be discharged from further liability." At the time of the first jubilee (1887) the railway mileage in the United Kingdom was 277,131.

VIRGINIA, a Southern State, one of the original thirteen, ratified the Constitution June 25, 1788; area, 42,450 square miles. The population, according to each decennial census, was 747,610 in 1790; 880,200 in 1800; 974,600 in 1810; 1,065,116 in 1820; 1,211,405 in 1830; 1,239,797 in 1840; 1,421,661 in 1850; 1,596,318 in 1860; 1,225,163 in 1870; 1,512,565 in 1880; 1,655,980 in 1890; and 1,854,184 in 1900. Capital, Richmond.

Government.—The following were the State officers in 1900: Governor, J. Hoge Tyler; Lieutenant Governor, Edward Echols; Secretary of State, Joseph T. Lawless; Attorney-General, A. J. Montague; First Auditor, Morton Marye; Second Auditor, Josiah Ryland, Jr. (succeeded, Oct. 17, by John G. Dew); Treasurer, A. W. Harman, Jr.; Adjutant General, W. Nalle; Superintendent of Public Instruction, Joseph W. Southall; Commissioner of Agriculture, George W. Koimer; Railroad Commissioner, James C. Hill; Commissioner of Labor, Archer Montague (succeeded, Feb. 1, by J. B. Doherty); Register of the Land Office, J. W. Richardson; President of the Supreme Court of Appeals, James Keith; Justices, John W. Riely (succeeded, Oct. 1, by A. A. Phlegar), John A. Buchanan, George M. Harrison, and Richard H. Cardwell. All are Democrats.

Population.—The census of 1900 shows the increase of population for the State to have been

198,204, or 11.9 per cent. The largest gains were made in the cities and in counties contiguous to cities. The increase in the southwestern mining section was also large. The population of Richmond, 85,050, is larger than in 1890 by 3,662, a gain of 4.5 per cent. During the decade thousands of people removed from the city proper to the suburbs, and, taken together, the urban and suburban inhabitants comprise a population of about 125,000. In 1801 the population of Richmond was about 6,000. The population of other cities in 1900 was: Petersburg, 21,810; Roanoke, 21,495; Newport News, 19,635; Lynchburg, 18,891; Portsmouth, 17,427; Danville, 16,520; Alexandria, 14,528; Manchester, 9,715; Staunton, 7,289.

Finances.—The operations of the treasury for the fiscal year ending Sept. 30 are indicated in the following synopsis of the Treasurer's report:

On account of the Commonwealth: Balance on hand Oct. 1, 1899, \$605,942.45; received in the fiscal year 1899-1900, \$3,739,267.92; total, \$4,345,210.37. Disbursed in the fiscal year 1899-1900, \$3,530,875.33. Balance on hand Oct. 1, 1900, \$814,335.04.

On account of the literary fund: Balance on hand Oct. 1, 1899, \$204,280.54; received in the fiscal year 1899-1900, \$271,107.56; total, \$475,388.10. Disbursed in the fiscal year 1899-1900, \$269,879.01. Balance on hand Oct. 1, 1900, \$205,509.09.

On account of interest on the public debt: Balance on hand Oct. 1, 1899, \$4,005.39; received in the fiscal year 1899-1900, \$696,388.32; total, \$700,393.71. Disbursed in the fiscal year 1899-1900, \$683,509.73. Balance on hand Oct. 1, 1900, \$16,883.98.

On account of the sinking fund: Balance on hand Oct. 1, 1899, \$437,860.63; received in the fiscal year 1899-1900, \$138,129.39; total, \$575,990.02. Disbursed in the fiscal year 1899-1900, \$507,169.60. Balance on hand Oct. 1, 1900, \$68,820.42.

On account of the Miller fund: Balance on hand Oct. 1, 1899, \$10,271; received in the fiscal year 1899-1900, \$70,339.35; total, \$80,610.35. Disbursed in the fiscal year 1899-1900, \$64,569.65. Balance on hand Oct. 1, 1900, \$16,040.70.

The total balance in the treasury to the credit of the several funds Oct. 1, 1900, was \$1,221,589.23. In addition to this the United States direct tax fund had to its credit \$1,162.74.

From the annual report of the State Board of Fisheries it appears that the net income to the State from its oyster beds for the fiscal year ending Sept. 30 was about \$70,000. During the thirty months of its existence the board had saved to the State \$150,000.

Education.—The cost of public schools in Virginia from the inauguration of the system in 1870 to 1900 amounts to \$36,919,186. According to the census of 1900, the school population was 691,320. In 1900 the State Superintendent of Instruction made two apportionments of the school funds among the counties and cities. Apportionment No. 1 disposed of \$196,334.88; apportionment No. 2, of \$789,487.44.

At the commencement of the University of Virginia, in June, degrees were conferred upon 97 graduates of the various departments.

Washington and Lee University conferred degrees upon 25 graduates. The commencement was marked by the dedication of the John Randolph Tucker Memorial building.

At the commencement of Roanoke College 13 graduates received the degree of A. B., and the degree of A. M. was conferred upon 3 former graduates.

The College of William and Mary, the oldest in the State, founded in 1693, graduated 30 in all departments.

A class of 25 was graduated at the Virginia Military Institute. A statue, Virginia Mourning her Dead, has been cast in Rome for the institute. As soon as the necessary funds are obtained a date will be announced for its unveiling in honor of the cadets who fell at the battle of New Market, May 15, 1864.

Randolph-Macon College, Ashland, conferred degrees upon 23 graduates. This is a college for men.

The Randolph-Macon Woman's College, at Lynchburg, which in 1900 conferred degrees upon 8 graduates, is only about eight years old, but has won remarkable success. Its fine buildings were formally dedicated Feb. 15. (See Annual Cyclopædia for 1896, page 833.)

The Virginia Polytechnic Institute, at Blacksburg, conferred degrees upon 35 graduates. Ninety per cent. of the graduates of this institution are engaged in industrial pursuits. It has the advantage of both State and national aid, and of grounds comprising over 400 acres. Its administration building, all but one wing, was destroyed by fire Feb. 1, 1900, and many valuable records, etc., were lost.

At the annual meeting of the trustees of the Peabody Educational fund, Oct. 3, the general agent presented a favorable report from Virginia on the work of the Hampton Normal and Agricultural Institute. The portion of the Peabody fund allotted to Virginia for the year ending Oct. 1, 1900, was \$5,300.

Delegates representing more than 500 teachers, members of the Virginia Teachers' League, which has a total membership of more than 1,000, held an important meeting at Richmond in December.

Penitentiary.—According to the October report of the Superintendent, the number of prisoners in the Penitentiary showed recent increase. The average number for 1899 was 1,262. The number in October, 1900, was 1,457—male and female, white and black. From July to October, 5 white and 11 colored convicts were pardoned on recommendation of the Board of Pardons.

New Charitable Organization.—Nov. 23 was the date of the organization, under a charter secured from the last Legislature, of the Children's Home Society of Virginia. It may be maintained as an independent State organization or may affiliate with the national organization, which has headquarters at Chicago. Similar organizations exist in 26 other States. The Virginia society has the whole State for its field. Its principal work will be to secure legal control of orphan children and provide homes for them in families.

Agriculture.—The State Board of Agriculture, in March, appointed 10 inspectors of fertilizers to fill places created by the Legislature of 1899-1900. One inspector was appointed from each congressional district, at a salary of \$50 a month while performing the duties of the office, the term of service being till the end of 1900. Samples of every brand of fertilizer offered for sale in the State are analyzed at the department, and the results are made known in printed bulletins, which are sent free to all farmers who apply for them. The importance of this official action may be estimated from the fact that the farmers of Virginia spend for fertilizers more than \$4,000,000 annually.

In November the State Board of Agriculture decided in favor of locating in Charlotte County the tobacco test farm to be established by the board. The Board of Supervisors of Charlotte County have agreed to give the State 500 acres for this farm.

Six prizes for Virginia apples were awarded at the Paris Exposition of 1900.

Jamestown Tercentenary.—At its annual meeting the Association for the Preservation of Virginia Antiquities appointed a committee to promote an exposition to be held at Richmond in 1907, to mark the three hundredth anniversary of the planting at Jamestown of the first permanent English colony on this continent.

Monument to Confederate Dead.—At Charles City Courthouse, Nov. 21, a beautiful monument to the Confederate dead of Charles City County was unveiled with elaborate ceremonies. The shaft, 21 feet high, is of Virginia granite, and rests upon a block of white granite 5 feet square.

Railroads.—According to official reports, the net receipts of the railroads of Virginia were greater in 1900 than in any previous year. Coal shipments to deep water were the principal feature of the traffic, but in general transportation there was enormous increase. An important event was the acquisition by the Pennsylvania Railroad of the control of the Chesapeake and Ohio and Norfolk and Western lines. Another was the consolidation of the various seaboard air-line roads.

The last spike, completing the Seaboard Air-line Railway from Richmond to Tampa, Fla., was driven at Richmond, June 2. Seven States are traversed by the Seaboard system, and its completion was celebrated as a Southern triumph in commercial enterprise.

Legal Decisions.—The Supreme Court of Appeals handed down in February a decision affirming the constitutionality of the Virginia fence law. In September the court handed down a decision holding that a judge may sue and be sued within the jurisdiction of his own court. In December an opinion was handed down by the court that the State can not sue for collection of taxes, but is confined to statutory remedies—distress of personalty or sale of land upon which the taxes have not been paid. The State can not go into equity and enforce the lien for the collection of taxes.

Lawlessness.—At Emporia, March 24, two men, one white, the other colored, were taken from the jail by a mob and hanged to a tree in front of the courthouse, no effort, apparently, having been made, either by citizens or by officers of the law, to prevent the lynching, which was participated in by both white men and negroes. The negro who was lynched had shot and killed two of the most popular citizens of Greenville County, and the white victim was hanged because he had been in company with the murderer when his crime was committed.

A young negro charged with the murder of an aged farmer near Buffalo Springs, April 22, was saved from lynching at the hands of a mob, which several times gathered and demanded his life, by the resolute action of the constable having him in custody.

In the lower part of Wythe County, Dec. 6, a young negro who had committed a criminal assault was taken from an officer and put to death by a mob near the scene of his crime. A negro companion who was arrested along with him escaped the same fate through a "compromise verdict" of the mob, who "tore his clothing from the upper portion of his body and whipped him unmercifully."

On the night of Dec. 1 the house of a justice of the peace, at Goode, Bedford County, was surrounded by a mob, who poured into it "a perfect rain of bullets and buckshot," the fire being directed particularly toward the justice's room and bed. He was badly wounded in the arm, but returned the fire, and the mob soon retired. A re-

ward of \$50 was offered by the Governor for the conviction of the men who fired upon the house.

Legislative Session.—The General Assembly, after a three months' session, adjourned March 7. The session was marked by the great amount of work accomplished, and by the extraordinary number of local and special bills passed. Some of the most important were these:

To require railroad companies to provide separate cars or compartments for white and colored passengers. This bill was passed without a dissenting vote in either house.

To provide for separate accommodations for whites and blacks on steamboats, etc.

To provide for a recodification of all legislation as to oysters, clams, crabs, fish, etc.

To prescribe the weight of a barrel of apples, and the size of barrels to be used in packing and shipping the same.

To prevent riotous conduct on trains.

To incorporate the John Marshall Memorial Association.

To incorporate the Jackson Memorial Association.

To submit to the qualified voters the question of calling a constitutional convention.

To provide for submission to the people amendments to sections 1 and 2 of Article VII of the Constitution, and also of Article X.

To create a State Department of Insurance and provide for an insurance commissioner.

Authorizing cities and towns to maintain free libraries.

To create the office of commissioner of valuation in every county and city of the State. The Supreme Court of Appeals, on March 30, declared this act unconstitutional.

To amend the delinquent land law, popularly known as "the land-grabbers' law" of the preceding Legislature. This law had met with strong public disfavor, and the amendments of 1900 eliminated many of its objectionable features.

To provide for the appointment of State and local boards of health.

Incorporating various railroads.

To incorporate the Negro Agricultural and Industrial Society of Virginia.

To incorporate the Children's Home Society of Virginia.

The Senate, on March 3, by a vote of 20 to 2, passed a resolution, which had already passed the House of Delegates, calling on the Virginia Senators in Congress to vote for an amendment to the Constitution of the United States making United States Senators elective by direct vote of the people.

The Legislature granted to the Virginia Fair Association a charter whereby horse racing and "glove contests" are authorized.

By the general pension bill passed by the Legislature, in addition to numerous private bills, the sum of \$135,000 was appropriated. The bill makes some changes in the pension law, one of the most important of which provides for payment to widows of Virginia soldiers, sailors, or marines who have died since the civil war the sum of \$25 per annum, upon conditions prescribed in the bill.

Important action was taken by this Legislature in the direction of removing the disabilities and extending the rights of married women in respect of property and various matters of individual legal status.

Political.—The Republican State Convention met in Norfolk, April 10. Candidates for presidential electors at large were nominated. The resolutions approved the administration at Wash-

ington, commending its financial and foreign policies; approved the ship subsidy bill in Congress, and opposed the civil service laws and urged their repeal or modification. They denounced the Legislature of 1899-1900 for adding to the "iniquitous election laws" and increasing the number of officeholders, and for the provision for holding a constitutional convention, which would result in the formation of an office-holding oligarchy that could only be overthrown by revolution.

The Democratic State Convention met in Norfolk, May 2. Presidential electors at large were nominated. In the platform the principles of democracy as enunciated in the Chicago platform of 1896 were approved, and the delegates to the national convention were instructed to vote for William J. Bryan as the candidate for President. The Republican policy of imperialism was denounced as undemocratic, un-American, and unconstitutional. The platform demanded that the Philippine Islands be turned over as soon as practicable to their own inhabitants; that a just territorial government be given to Porto Rico; and that the solemn declarations of our Government concerning Cuba be promptly and honorably made good. Opposition was declared to militarism and great standing armies as the worst enemies of the republic. Criminal trusts and other illegal combinations of capital were denounced as a serious menace to the public welfare, and the Republican party was arraigned for failing to enforce existing laws and to enact others against them. The State administration was approved and the people were congratulated upon its liberal support of the public schools and of disabled Confederate soldiers and Confederate widows. The platform approved the action of the General Assembly in submitting to the people the question of calling a constitutional convention, and counseled that in framing a new Constitution no effort should be made to disfranchise any citizen of Virginia who had a right to vote prior to 1861, nor the descendant of any such person.

At the elections of May 24 the Democrats were generally successful in the election of local officers. The most important question before the people, that of calling a constitutional convention, was decided in the affirmative, and it remained for the next Legislature to fix a date for the convention to meet. The total vote on this question was 137,732, and the majority in favor of the convention was about 17,000.

At the general election of Nov. 6 the Democrats of the State elected their full congressional ticket by a majority of more than 60,000. The presidential vote was divided as follows: Bryan, 146,080; McKinley, 115,865; Woolley, 2,150.

VISUAL INSTRUCTION, information that reaches the mind chiefly through the sense of sight, aided by the explanation of the teacher. A picture of the subject to be studied, or a series of pictures of different parts of the subject, is

THE AMERICAN MUSEUM OF NATURAL HISTORY, SOUTH FRONT.

AUDITORIUM IN MUSEUM OF NATURAL HISTORY, SHOWING SPECIAL GALLERY FOR LANTERNS.

projected upon a white screen or background in a dark room by means of a stereopticon. This picture is magnified many times so that it can be seen in minutest detail by the class or audience. Visual instruction is not a new method of imparting knowledge, but it is now carried to such perfection, and is found so helpful in the study of science, history, travel, and domestic economy, that it is worthy to be termed an art.

The Pictures.—A photographic negative of the object to be studied is first made, from which a positive is printed upon a prepared glass $3\frac{1}{2}$ by 4 inches in size. The glass for these positives must be clear and bright to give the best results. All objects covered by the picture will appear in light and dark shades, showing upon the canvas without color, but these positive pictures may be so tinted by a skillful artist that Nature will be reproduced quite accurately. Especially is this true of landscapes, birds, mammals, and flowers.

The Projecting Instrument.—The primitive method of projecting these pictures upon a screen was by means of the magic lantern, beginning with its use as a mere toy, where a common oil lamp was employed for a light, and coming by degrees to the use of the stereopticon, single, double, and triple. The stereopticon consists of a case of metal in which is placed the light, the condenser for concentrating the rays of light, the lenses or object glasses for magnifying the pictured object, and the slide holding the positive picture in place.

The Illuminator.—The oil lamp can not be made to throw a light strong enough to bring out the pictures distinctly without the use of many wicks and consequent imperfect combustion, im-

parting a yellow color to the flame, and frequently causing smoke annoying to the lecturer as well as to the audience. House gas, by means of the Welsbach burner, may be used in a parlor or schoolroom, but the extreme delicacy of the "mantle" employed prevents its general use as an illuminator even as a stationary light. Acetylene gas is of recent use, and has been found to be superior to oil light. The oxyhydrogen or lime light projects a very clear, bright picture, and is in common use for illumination in illustrated lectures. The electric light is more intense and penetrating than the lime light, and the mechanism of the lamp has been so simplified and brought to such a state of perfection that it is easily manipulated, and that light is now used exclusively at the American Museum of Natural History.

Other Methods.—Visual instruction may be imparted in other ways than by the use of the stereopticon. The microscope permits of the investigation of infinitesimal objects in Nature in all their complicated structure and in their natural, variegated coloring, but only one person can use the instrument at a time unless the microscope be connected with the stereopticon. Thus few students could become familiar with the natural objects beyond their own immediate vicinity. For the popular purposes of visual instruction the stereopticon and the photograph have established themselves permanently in the principal educational centers.

The American Museum of Natural History.—The present standing of visual instruction and its development are best shown as exemplified at the American Museum of Natural History, of

which Mr. Morris K. Jesup is president of the Board of Trustees, and which is located at Seventy-seventh Street and Central Park West, where this method of public instruction has attained its highest perfection under the direction of Albert S. Bickmore, A. M., Ph. D. In 1882 Prof. Bickmore began his work in visual education by means of illustrated lectures in a single room at the museum, before an audience of 28 persons, mostly school-teachers. In 1884 his subjects illustrated were the skeleton, muscular system, arteries and veins, nervous system, digestion, respiration, hygiene, granites and sandstones, limestones and marbles, evergreen trees (pine, spruce, cedar), deciduous trees (oak, elm, and maple). In 1885 two rooms were necessary to accommodate the growing classes. Then Chickering Hall, at Eighteenth Street and Fifth Avenue, was filled, and shortly afterward a hall at the museum, accommodating about 1,000 persons, was fitted up with all the appliances necessary for the presentation of illustrated lectures in a form as nearly perfect as could be conceived of at that time. The desire of the teachers and general students to get the benefit of this visual instruction became so great that for several years each new lecture has been repeated four times to entirely different audiences.

Within the last year there has been completed and dedicated at the museum a new hall, the most complete in the world devoted entirely to visual instruction. It will accommodate 1,366 persons with chairs. It is so arranged as to double screens, galleries, and auditorium that each listener may have a direct view of both pictures on the screens at the same time.

The museum gives its instruction under the auspices of the Department of Public Instruction of the State of New York. The provisions for 1900, passed in 1895 and 1899 were: An act to provide that additional facilities for free instruction in natural history, geography, and kindred subjects, by means of pictorial representation and lectures, may be furnished to the free common schools of each city and village of the State that has, or may have, a superintendent of free common schools. In section 1 the State Superintendent of Public Instruction was authorized to furnish the facilities called for by this act. The local school authorities are allowed to "cause the aforesaid illustrated lectures to be repeated to their artisans, mechanics, and other citizens on the legal holidays and at other times. Any institution instructing a teachers' training class, or any union free school, may have the free use of the apparatus upon payment to the Superintendent of Schools, loaning the same, the necessary expenses incurred in such use, or injury to said property." In section 2 an annual report of each school superintendent to the Department of Public Instruction is made necessary, containing a full statement of the extent to which the prescribed instruction has been given, with the usefulness of the same. In section 3 the sum of \$38,000 was appropriated for the support and maintenance of

said instruction for the year beginning Oct. 1, 1900. In section 4 the State Superintendent of Public Instruction was authorized to permit the sale of the slides for illustrative teaching to such educational institutions of the State as give free instruction to their pupils. The slides are sold at the cost of manufacture.

Subjects Treated.—Under similar previous statutes, up to the close of 1900, 354 lectures had been given, covering 187 different subjects, the slides having been furnished to the State normal schools, to the conductors of teachers' institutes, to the office of the Department of Public Instruction at Albany, and to the several cities and towns. These lectures concerned the following subjects: Human anatomy and physiology; building and ornamental stones; physical geography; birds, fishes, reptiles; geography and ethnology; astronomy, the sun, moon, and tides; gold, silver, and iron; planets, the earth; geology, botany, forestry; Columbian Exposition; tea, coffee, and sugar; useful minerals; coal and oil; foods. From the above-mentioned lectures a committee, representing the Council of School Superintendents of the State of New York, have made their selection. The subjects chosen for 1899-1900 were: Luzon and Manila, the Visayas and Sulus, the Hawaiian Islands, and Alaska; and for 1900-1901, Exposition of Paris in 1900, Paris and South America.

Prof. Bickmore often travels thousands of miles at his own expense to secure the materials for one lecture. He is usually accompanied by an expert photographer, who takes many pictures of every important place and object of interest. The best negatives are then selected, and 72 slides are prepared for one lecture; 85 sets of these slides are then made, and a full set is sent to the following educational centers: Albany, Amsterdam, Auburn, Binghamton, Buffalo, Cohoes, Corning, Cortland, Dunkirk, Elmira, Geneva, Gloversville, Hornellsville, Hudson, Ithaca, Jamestown, Johnstown, Kingston, Little Falls, Lockport, Middletown, Mount Ver-

HALL OF PALEONTOLOGY.

non, Newburgh, New Rochelle, to each of the boroughs of New York city, Niagara Falls, North Tonawanda, Ogdensburg, Olean, Oswego, Poughkeepsie, Rensselaer, Rochester, Rome, Schenectady, Syracuse, Troy, Utica, Watertown, Watervliet, and Yonkers, besides the villages of Albion, Batavia, Canandaigua, Catskill, Glens Falls, Haverstraw, Herkimer, Hoosick Falls, Ilion, Lansingburg, Malone, Mechanicsville, Medina, Norwich, Nyack, Oneonta, Owego, Peekskill, Penn Yan,

Plattsburg, Port Chester, Port Jervis, Saratoga Springs, Seneca Falls, Sing Sing, Tonawanda, Waterford, and White Plains. About 26,000 stereopticon slides are furnished by the museum each year to these cities and towns in the State of New York, and with each set of views is sent a copy of Prof. Bickmore's lecture on that subject.

Slides for Other States.—Arrangements are now perfected whereby the museum will send the slides and lectures to the State superintendents of other States and to Canada, at a nominal charge to cover the cost of manufacture and delivery, under these restrictions, as stated in the circular letter:

"We are not dealers in slides, but we are desirous of promoting free public education throughout our land by means of illustrated teaching; and the State Superintendent of Public Instruction of the State of New York, under whose auspices our entire system is carried on, has given us authority to supply, as a matter of interstate courtesy, the superintendent of public instruction of each other commonwealth with one series, and no more, of our slides at cost, after we have finished the work which is required of us by the statutes of our own State. We do not keep a stock of slides on hand, but fill each order separately; hence considerable time must elapse before a shipment can be made, and we can only

lectures will be repeated many times at the American Museum of Natural History, and in all the educational centers of the State of New York. In this way the people will become familiar with coming events, and will be educated up to a point where they may derive the greatest benefit from the exposition.

For the Kindergarten.—One of the most beautiful lectures ever prepared by Prof. Bickmore is for the kindergarten. It consists of 24 views of natural objects seen in the country—as boys riding on horseback, children of a district school at recess, driving the cows, gathering apples, etc.; 24 pictures of buildings and street scenes in the city; and 24 views of the seashore—lighthouse, sailing vessel, waves, etc. Each view is explained by a children's song, or in such words as are familiar to children. This lecture has demonstrated that visual instruction is as valuable for children as for their parents.

A Gold Medal.—At the Exposition of Paris in 1900 an exhibit was made by Prof. Bickmore, representing conjointly the American Museum of Natural History and the Department of Public Instruction of the State of New York, of the slides and general methods of visual instruction as carried on in New York State, and showing the wide system of free public education. The International Jury of Fifteen, eleven of whom were Frenchmen, unanimously awarded to the lecture department of the museum a gold medal, the museum having outstripped all competitors in the excellence of its exhibit of colored slides and in the perfection of its system of educational work. While in Paris, Prof. Bickmore, at the request of the *École Internationale*, gave three illustrated lectures on the United States and their dependencies at its annual meeting. So highly was his work appreciated that he was invited to attend the next annual meeting of the *École Internationale* in 1901, to be held at the International Exposition in Glasgow, Scotland, and give a series of lectures, and then repeat them in the principal cities from Glasgow to London, that the British public might

THE JESUP COLLECTION OF NORTH AMERICAN WOODS.

undertake the preparation of such illustrations between May 1 and Sept. 1. Each lecture is sold complete, and not a selection of slides therefrom."

The New York State Superintendent's restrictions on the use of this visual instruction material are: "In no case shall the use of said apparatus be permitted at any lecture where an admission fee shall be charged, or which shall be given in connection with any other entertainment of any nature, or for the benefit of any private school, church, Sunday school, hospital, or any purpose not connected with the free common schools of the State. No copies in any form may be made from our manuscripts or slides."

The Purpose in New York State.—It is known that in the year 1901 a Pan-American Exposition will be held at Buffalo, N. Y. That this exhibition of the material and intellectual progress of the North and South Americas may be duly appreciated, Prof. Bickmore, in 1900, prepared a series of three lectures on the scenery and natural resources of South America. These

become acquainted with the latest phase of visual instruction in the New World. Mr. W. F. Stead, of the *Review of Reviews*, London, commended the American Museum's system of visual instruction, and showed the demand for it in England and throughout the English-speaking colonies. The system will soon be introduced into Madras, southern India, whence it will probably spread through the peninsula.

In the City of New York.—For the season of 1899-1900 the school authorities of the city of New York appropriated \$100,000 to be expended under the supervision of Dr. Henry M. Leipziger for free public lectures for the people. Two thousand lectures were given at various educational centers in the boroughs of Manhattan and the Bronx. These lecture centers are all fitted out with lanterns and screens and all the necessary apparatus for visual instruction. A count of the people present at each lecture shows that 550,000 persons availed themselves of the privilege of this system of education; and the lectures included

almost every subject about which information may be imparted. The free visual instruction in the city of New York was begun thirteen years ago in only a few centers and at a small expenditure of money. Each year the system has been enlarged by the earnest demand of the public for this form of education, until it is now come to be recognized as a prominent and important branch of the city's educational work. In the past year a similar system of free public lectures to the people was inaugurated in Brooklyn, under the auspices of the Board of Education of that borough.

VOTING MACHINES, mechanical devices used in place of paper ballots in elections, which also count and add the votes cast. Some operate by the deposition of balls or disks, some by perforations in a sheet of paper, which are afterward counted, and others, of the self-registering type, are supplied with an indicator adjacent to the name of each candidate, which is operatively connected with an internal mechanical register—one for each candidate. In this last type of machine the voter makes his selections by placing the different indicators in position to signify his choice of all the candidates, and by the subsequent operation of a lever or turnstile registers his selections as indicated.

According to the present election laws in force in the United States, a voting machine must be so constructed that it enables a voter to cast his vote in secret; that it counts positively each vote cast; that it permits a voter to make such selection among the candidates as he wishes—for all of one party, or in part for those of one party and in part of those of other parties; that it permits the voting for persons nominated by any party, and at the same time prevents voting for candidates in excess of the number to be elected; that it be convenient in its operation for the voter, with little instruction, and so constructed that it may be arranged for use by unskilled persons; that it be so constructed that it will not become inoperative during an election; that it be so arranged that the blind and illiterate are able to operate it without assistance; that it will permit a voter having made an error to change his vote while in the booth; that it will permit voting for or against questions or amendments; that it will permit the voter both to indicate and register his own vote, and place it beyond the power of any one else to deprive him of it; that it will permit limited voters, women and certain nontaxpayers, to vote for certain candidates and on certain questions, and at the same time prevent them from exceeding their privileges.

In 1848 a patent was issued in England for a mechanical device for the registering of votes, but no voting machine was manufactured until the invention of the Myers ballot machine in Roch-

ester, N. Y. The Myers machine consisted of a steel booth 5 feet square and 7 feet high. The voter entered by a door, which was closed, and

A VOTING MACHINE IN USE.

found names of candidates arranged in the form of an Australian ballot upon one side of the machine, and opposite each candidate's name a push knob, which the voter pressed to indicate his choice. Then by his passing through a small vestibule and out of an exit door, the mechanical counters of the candidates he had chosen were actuated and the machine was arranged for the next voter. The Myers machine was first used in April, 1892, and for a few years following, with some success, but for some reason the manufacture was discontinued in 1898.

The United States voting machine, manufactured under the S. E. Davis patents of 1894 and 1895, is arranged to be used without the aid of a booth, the face of the machine being turned away from the public, and screens at either end of the machine rendering the casting of the ballot secret. In this machine the party nominations are arranged in horizontal lines from left to right, and below each candidate's name is a small pull knob, which is connected with the counter for that candidate, and at the left of each party line is a large knob, the pulling of which will vote a straight party ticket. The ballot may be cast by first pulling out a party knob and returning the knobs of such candidates as are not to be voted for, and in their stead knobs pulled out for such candidates as are desired. Or the voter may, if

he wishes, operate the individual knobs without first pulling out the straight-vote knob. At the close of the election the fronts of the counters are exposed to view, and a record is taken of the result. This machine has been in use in Hornellsville since 1896, and lately in Jamestown and Syracuse, N. Y., and Detroit, Mich. This was the

A VOTING MACHINE, OPEN.

first machine to fulfill completely all the requirements of the present election law.

The Standard voting machine, patented by A. J. Gillespie, of Atlantic, Iowa, in 1897, is about 4 feet square and 8 inches deep, and is supported by legs, the top being about 6 feet from the floor. The ticket is arranged upon the face of the machine in the form of an Australian ballot, the party

nominations being in vertical columns, with a numbered pointer at the left of each candidate's name and a large lever at the top of each party column. Extending from the top of the machine outward about 4 feet is a semicircular rod, upon which a curtain is drawn by the voter as he enters the machine, thus inclosing himself in a booth and unlocking the machine for voting. To vote on this machine, a straight-vote lever is pulled down, which turns a pointer over the name of each candidate in that party. Should the voter then desire to split, he can do so by turning back any of the individual pointers and in their places turning others over the names of the candidates he wishes to favor. This machine fulfills every requirement under the present election law. The Standard voting machine was first used at a city election in Rochester in 1898, and since then it has been adopted in Buffalo, Utica, Ithaca, Elmira, Auburn, Oswego, Niagara Falls, Rome, Poughkeepsie, Hudson, Johnstown, Gloversville, and many towns. In no case where this machine has been adopted has there been a return to the paper ballot.

Dr. R. H. Thurston, one of the three voting-machine commissioners of New York State, and head of the mechanical department of Cornell University, in his report on this machine for the election in Ithaca in November, 1899, says:

"1. The voting machine is a simple, reliable, durable, and convenient apparatus for its purpose.

"2. The machine compels the deposit of a perfect and accurate ballot, of the form chosen by the voter.

"3. It restricts the voter absolutely to the limits of the law and permits him freedom as absolute in voting within that limit.

"4. Defective ballots, the usual fault of ordinary methods of voting, are entirely done away with, and no man loses his vote through defect of the system, or fault of his own, if he votes at all. The disfranchised voter becomes unknown.

"5. Fraudulent voting is impossible, as well as errors in voting.

"6. The vote cast is registered, vote by vote, with absolute accuracy and certainty.

"7. The result can be declared immediately upon the close of the polls, having been already completely counted.

"8. The cost of the system is so much less than that of the old method that the machines usually pay for themselves in three to seven years."

W

WASHINGTON, a Pacific coast State, admitted to the Union Nov. 11, 1889; area, 69,180 square miles. The population, according to each decennial census since admission, was 349,390 in 1890 and 518,103 in 1900. Capital, Olympia.

Government.—The following were the State officers in 1900: Governor, John R. Rogers; Lieutenant Governor, Thurston Daniels; Secretary of State, W. D. Jenkins; Treasurer, C. W. Young; Auditor, Neal Cheatham; Attorney-General, P. H. Winston; Adjutant General, E. H. Fox; Superintendent of Education, F. J. Browne—all Populists except Winston, who is a Silver Republican; Commissioner of Public Lands, Robert Bridges; Dairy Commissioner, E. A. McDonald; Veterinarian, S. B. Nelson; Insurance Commissioner, C. J. Heifner; Chief Justice of the Supreme Court, M. J. Gordon, who resigned Aug. 1; Associate Justices, R. O. Dunbar, Mark A. Fullerton, T. J. Anders,

James R. Reavis; Clerk, C. S. Reinhart—all Republicans except Reavis, who is a Democrat.

State officers are chosen for terms of four years, at the time of the presidential elections. The Legislature meets biennially in January of the odd-numbered years. It is composed of 34 Senators and 80 Representatives.

Population.—The State has gained 48.2 per cent. in the past decade. The census by counties in 1900 was as follows: Adams, 4,180; Asotin, 3,366; Chehalis, 15,124; Chelan, 3,931; Clallam, 5,603; Clark, 13,419; Columbia, 7,128; Cowlitz, 7,877; Douglas, 4,926; Ferry, 4,562; Franklin, 486; Garfield, 3,418; Island, 1,870; Jefferson, 5,512; King, 110,003; Kitsap, 6,767; Kittitas, 9,704; Klickitat, 6,407; Lewis, 15,157; Lincoln, 11,969; Mason, 3,810; Okanogan, 4,689; Pacific, 5,983; Pierce, 55,515; San Juan, 2,928; Skagit, 14,272; Skamania, 1,688; Snohomish, 23,950; Spo-

kane, 57,542; Stevens, 10,543; Thurston, 9,927; Wahkiakum, 2,819; Walla Walla, 18,680; Whatcom, 24,116; Whitman, 25,360; Yakima, 13,482.

The population of Seattle is 80,671; in 1890 it was 42,787. Tacoma has grown from 36,006 in 1890 to 37,714 in 1900. Spokane has 36,848 inhabitants. The population of incorporated places having more than 2,000 and fewer than 25,000 is as follows: Aberdeen, 3,747; Ballard, 4,568; Colfax, 2,121; Dayton, 2,216; Everett, 7,838; Fairhaven, 4,228; Hoquiam, 2,608; New Whatcom, 6,834; North Yakima, 3,154; Olympia, 4,082; Port Angeles, 2,321; Port Townsend, 3,443; Republic, 2,050; Roslyn, 2,788; Snohomish, 2,101; Vancouver, 4,006; Walla Walla, 10,049.

Finances.—The following statements are taken from the Governor's message at the beginning of 1901:

Four years ago the total State debt was \$2,176,347.64. This, in spite of the fact that our State Constitution, in the most explicit terms, forbids any indebtedness in excess of \$400,000. Of this total debt, \$1,777,916.03 was in the form of general fund warrants. These, with the military fund warrants, amounting to \$96,429.61, called for 8 per cent. interest, or a total of \$150,000 in interest per annum, approximately. Warrants were two and a half years in arrears, so that on each dollar used by the State in the conduct of its business 20 per cent. in interest was paid. During the past eight years there has been paid, as interest on State indebtedness, mostly to brokers and dealers in warrants, the enormous sum of \$916,713.36. During the past four years the total outstanding indebtedness has been reduced from \$2,176,347.64 in 1897 to \$1,392,639.60 on Jan. 1, 1901, and of this latter amount \$730,000, in the permanent school fund, has, under the law of 1899, been used by the State in the payment of general fund warrants and the issuance of 3½-per-cent. State bonds, which, in lieu of cash expended for this purpose, are placed in the permanent school fund. On general fund warrants thus redeemed, bearing interest at 8 per cent., there has been a direct and positive saving of 4½ per cent.; and as the 3½ per cent. accruing upon these bonds is added to the permanent school fund there has been a practical saving of all interest charges upon nearly \$750,000. Interest charges have been still further reduced by a reduction of the rate paid, from 8 to 5 per cent. Instead of more than \$2,000,000 of indebtedness, the greater part bearing interest at 8 per cent., as was the case four years ago, the following exhibit shows the condition of the State debt on Jan. 1, 1901: General fund warrants, bearing 5 per cent. interest, less cash on hand, \$516,398.02; State bonds, bearing 3½ per cent. interest, \$155,000; school bonds, bearing 3½ per cent. (interest covered into treasury), \$730,000; total, \$1,401,398.02; less cash in interest fund, \$8,738.36; total debt, \$1,392,659.66.

"Among the causes leading to an improved condition of the State's finances must be named the enactment of the revenue law of 1897. This has been found most efficient. The issuance of delinquent tax certificates, bearing 15 per cent. interest, operates to induce prompt payment of taxes. The Bedford law of 1899, calling for the investment of money in the permanent school fund in outstanding general fund warrants, is also to be credited with saving to the State large sums of interest."

The State levy as fixed this year is as follows: For schools, 3½ mills; general fund, 2½ mills. The military and interest fund levies are regulated by statute and are each ¼ of 1 mill. In 1899 the levy was as follows: For schools, 3½ mills; general

fund, 2½ mills. The general fund levy is considerably less than last year, but the school fund levy is more; the reason for this is that the levy for schools is based on the number of school children in the State. Last year there were 127,366, while this year the number is 139,554.

The Auditor's estimate of the receipts of the general fund during the biennial term beginning April 1, 1901, is \$1,820,000, and of expenses, \$1,116,800.

Education.—The law requires a State tax, not exceeding 4 mills, sufficient to produce \$8 for each child of school age; this is for the common schools. Five institutions of higher learning are supported by State appropriations: The University of Washington, at Seattle; the Washington Agricultural College and School of Science, at Pullman; and three State normal schools, one at Cheney, for the eastern portion of the State; one at Ellensburg, for the central; and one at New Whatcom, for the northwest. The ordinary expense of these institutions to the State is about as follows: Agricultural College, \$15,000; State University, \$40,000; normal schools, \$45,000.

Olympia is endeavoring to raise an endowment of \$15,000 for a university which certain capitalists have offered to found on condition of this fund being given by citizens. It is to be called the Olympic University. The formal offer to the committee appointed by the Chamber of Commerce describes the proposed institution, giving among other details the following peculiar feature: "Said parties propose to the best of their ability to make said Olympic University a national institution by operating in connection with it a 'department of travel,' which is an organized plan to combine the advantages of travel and observation with the usual text-book work, and by means of this organized plan they expect to bring students from all parts of the country and to build and maintain an institution at Olympia sufficient to accommodate them."

The text-books for the public schools are selected once in five years by the State Board of Education. Those for the coming five years were chosen in May. A large part of those adopted are publications of a local house lately established, and some were prepared by "local talent." Protests in regard to two of them have been made by the superintendents of many of the schools. One of them says: "We examined the geography at the last board meeting and agreed it was wholly unfit for use. Its maps are inaccurate and poorly colored. It contains bad spelling and ungrammatical sentences. The map of Washington is especially poor. The speller is full of errors, some of which are typographical and some apparently made through ignorance. No teacher will dare give out a lesson before going over it in advance and correcting mistakes. I should have preferred to use no text-book at all rather than these."

Militia.—The National Guard consists of 1 full regiment of infantry, made up of 3 battalions of 4 companies each, and in addition 2 companies of infantry unattached, 1 battery without guns, drilling as infantry, and 1 troop of cavalry. The last Legislature appropriated \$10,000 for the purpose of bringing from the Philippine Islands the remains of those Washington boys who died in their country's service. The bodies of 22 volunteers were brought back to their home State, and all but 9 were claimed by friends and taken to their homes. These 9 were brought to the capital city, where the Masonic fraternity of Olympia gave a handsome tract of land for their interment.

Charities and Corrections.—The maintenance expenses of the State institutions for the three and

a half years ending Sept. 30 were as follow: Western Hospital for Insane, total, \$279,194.90; daily per capita, 594.96 inmates, \$0.3673; Eastern Hospital for Insane, total, \$174,258.61; daily per capita, 307.36 inmates, \$0.4438; State Penitentiary, total, \$191,169.99; daily per capita, 357.2 inmates, \$0.4190; State Reform School, total, \$67,798.70; daily per capita, 133.38 inmates, \$0.3456; Soldiers' Home, total, \$86,148.43; daily per capita, 144.5 inmates, \$0.4667.

Banks.—The report of the condition of the 27 State banks, May 31, shows: Loans, \$4,708,893; real estate, \$1,267,987; surplus, \$10,745; deposits, \$7,572,469; undivided profits, \$211,701; cash, \$1,031,912. The report of the national banks in the State, April 26, shows deposits of \$20,420,954, and cash on hand, \$2,925,252.

Public Lands.—The figures from the General Land Office for the year ending June 30 include the following concerning Washington: Area unappropriated, unreserved, and unsurveyed, 5,888,581 acres; area unappropriated, unreserved, and surveyed, 5,237,302 acres; area reserved, 12,366,791 acres; area appropriated, 19,264,206. The reserves in Washington are: Mount Rainier reserve, 2,027,520 acres; Olympic reserve, 1,923,840 acres; Washington forest reserve, 3,594,240 acres. The Priest river reserve, in Washington and Idaho, comprises 645,120 acres.

A proclamation opening the northern half of the Colville Indian Reservation in the northwestern part of the State was issued in April, to take effect, according to the law, six months later, Oct. 10. The half that is opened contains 1,500,000 acres, 300,000 of which were allotted to the Indians under the treaty of cession. It is estimated that at least 300,000 acres are first-class agricultural land, about the same area mineral land, and the remainder is covered with a fine growth of fir, cedar, and hemlock. The lands chosen by the Indians lie chiefly along Kettle river.

The report of the Geological Survey on the Olympic forest reserve says that, taken as a whole, "this is the most heavily forested region of Washington, and with few exceptions the most heavily forested section of the country. The densest forests are found in the townships near the Pacific coast, in the northwestern part of the reserve, while in the mountains, as the altitude increases, the forests become less dense and the species become of less value for lumber. The total stand of timber upon the area examined—2,400 square miles—is 37,100,000,000 feet, an average of 24,000 feet per acre for the entire area. There is no section of equal area in the State so heavily clothed with forests as this." The timber is hemlock, red fir, silver fir, cedar, and spruce. Portions of this reserve were restored to the public domain this year because more suitable for farming than for forest culture.

The total amount of timber in the State, as estimated by Mr. Gannett, of the survey, is, under the Washington lumbering practice, 114,778,000,000 feet, board measure. Of this amount, more than nine tenths, or 103,504,000,000 feet, is west of the crest of the Cascade range, the remainder—11,274,000,000 feet—being upon its eastern slope and in the northern and eastern portions of the State. "With the exception of the redwoods of California," he says, "the forests of Washington are the densest, heaviest, and most continuous in the United States. Except for a few prairie openings, and except where removed by fire or the ax, they cover the country as a thick mantle from high on the Cascade range westward to the shores of the Pacific. Out of the 15,858 square miles of the State formerly covered with merchantable timber,

20 per cent. has been destroyed by fire, 22½ per cent. has been cut, and the remainder, 57½ per cent., is still covered by standing timber. The present supply, as it now stands, is sufficient to supply the sawmills of the United States for four years, under the present rate of cutting."

The report of the State Land Department for the four years past shows a great increase in the leasing of school and granted lands. The total receipts from the lands from 1892 to 1896 were \$945,521.32, and from 1896 to 1900, \$1,704,374.65.

Industries and Business.—Lumber shipments were as follow for the year ended June 30, 1900: Cargoes to foreign ports, 176,911,582 feet; cargoes to domestic ports, 238,855,465 feet; rail shipments, 304,205,000 feet; total, 719,972,047 feet. The value of the foreign cargoes was \$1,835,329. No other values are stated by the Trade Register. Assuming that the domestic cargoes and shipments averaged with the foreign cargoes—\$10.40 a thousand—the total of the shipments closely approached \$7,500,000.

The Puget Sound canneries have had an unusually poor season, the pack being only 432,301 cases, 50 per cent. less than that of 1899.

The report of the Dairy Commissioner shows great growth in the dairy industry.

The first bounty of 1 cent a pound on beet sugar, offered by the last Legislature, was paid in December. It amounted to \$2,168.90, and was paid to a company in Spokane County.

The stock industry of the State of Washington is valued at \$30,000,000. The loss to stock owners from contagious diseases approximates \$75,000 annually.

The discovery of shot gold running \$10 to the cubic yard was reported in December to have been made on Fourth-of-July creek, a branch of Kettle river.

The number of articles of incorporation filed with the Secretary of State in 1897-'98 was 1,852; in 1899-1900 it was 2,168. The receipts for the first two years amounted to \$74,773.47, and for the last two \$91,150.39.

The State Capitol.—An application was made in December for a writ of mandate against the Governor and the other Capitol Commissioners, to appear and show cause why they should not go on with the building of the new Capitol. The application was made by F. H. Goss, to whom the contract was awarded Jan. 30, 1896. The action was dismissed in the Superior Court, but may be appealed to the Supreme Court. The Governor explains the matter in his message. "The State has from the General Government," he says, "a grant of 132,000 acres of wild lands, donated for the purpose of aiding in the erection of public buildings at the State capital. But this donation is unproductive. It is agreed that these lands can not now be sold. Regarding their future value a great difference of opinion prevails. Two years ago it was said that if a State Capitol was immediately desired a proposition to purchase the Thurston County courthouse might be successfully managed. This is a beautiful building, centrally located, costing \$150,000. The State holds in the permanent school fund \$150,000 of Thurston County warrants. An exchange of paper might transfer the title. One hundred thousand dollars, carefully expended, would build an addition to the rear, in the same general style of architecture, containing comfortable quarters for the State Legislature."

Political.—State officers were elected in November. There were five tickets—Democratic (in which the Populists united), Republican, Prohibition, Social-Democratic, and Socialist-Labor. The

two members of Congress are elected by the State at large.

The Republicans held their first convention at Ellensburg, April 5, elected delegates to the national convention, and instructed them for President McKinley. The resolutions were mainly expressions of approval of the policy of the administration. The second Republican convention met at Tacoma, Aug. 15, and adopted a platform commending the national administration and the work of the State members of Congress, and said further:

"We favor the building of railroads within our State as an essential means of its development and growth, and we also favor the adoption and enforcement of just and equitable laws regulating and controlling them.

"We stand for loyalty to the flag; for the old standard of value for all our money; for protection and reciprocity; for the Nicaragua Canal, owned, operated, and defended by the United States; for the election of United States Senators by direct vote of the people; for the further enlargement of our trade and commerce; for such discrimination and national aid as shall speedily result in the upbuilding of our merchant marine; for the rigid enforcement of the law against trusts; for the loyal and liberal support of the nation's defenders—the army and navy—both in peace and in war; for the uncompromising suppression of the rebellion on the island of Luzon; for the unlimited defense of every foot of territory under the flag, and for the protection of every citizen in the land; for the immediate rescue of the people imperiled in China, and for ample restitution for loss of life and property therein; for a territorial form of government for Alaska, including protection to navigation, opposing relinquishing soil or sovereignty of any part of that district; for the construction of good and permanent wagon roads throughout the State; for the rigid enforcement of law and order and the economical administration of public affairs, national, State, and county."

Following are the nominations: For Governor, J. M. Frink; Lieutenant Governor, H. G. McBride; Secretary of State, S. H. Nichols; Treasurer, C. H. Maynard; Auditor, J. D. Atkinson; Attorney-General, W. B. Stratton; Land Commissioner, S. A. Calvert; Superintendent of Public Instruction, R. B. Bryan; Judges of the Supreme Court, Wallace Mount, R. O. Dunbar; Presidential Electors, Frank Hastings, S. G. Cosgrove, Charles Sweeney, J. M. Boyd; Congress, Francis W. Cushman, Wesley L. Jones.

The first Democratic convention, at Spokane, May 10, elected delegates to the Kansas City convention and adopted resolutions denouncing the attitude of the administration toward trusts and on bimetalism; opposed imperialism and the Porto Rican tariff; expressed sympathy for the Boers; opposed unrestrained Japanese immigration; approved the record of United States Senator Turner; commended the State administration; instructed the delegates for William J. Bryan, the "great commoner of the present day, who ranks with and will have a place in history with Jefferson, Jackson, and Lincoln"; and recommended James H. Lewis for Vice-President.

The Democrats, the Populists, and the Silver Republicans held conventions at Seattle, Aug. 27, and after conference met in a union convention, agreeing to pass under the Democratic name. The more significant declarations of the platform were:

"We oppose trusts and combinations which corner the products of industry and levy tribute on the people, and we denounce the Republican policy which corruptly creates and fosters these

harmful combinations. We are against monopolies of all kinds, and especially view with the gravest concern the attitude of the Republican administration in creating the greatest of all monopolies in its delegating to the national banks the sovereign right to make and issue the people's money.

"We witness with shame and humiliation the cowardly and inconsistent action of the present Republican administration in hauling down the American flag that for a third of a century has floated in honor and unchallenged over the Porcupine mining district of Alaska.

"We demand such legislation as will insure to the farmers and producers of the State of Washington a reduction of freight rates and fares to a just basis.

"We demand the inauguration of such measures as shall give the people the right to express themselves, when they so elect, upon all important questions, by the system known as direct legislation.

"We commend the official conduct of all our State officers, and call attention to the contrast between the present excellent financial condition of the State and the blight and ruin prophesied by the opposition to surely result from the election of our State officers."

The ticket follows: For Governor, John R. Rogers; Lieutenant Governor, William E. McCroskey; Secretary of State, James Brady; Treasurer, W. E. Runner; Auditor, L. J. Silverthorn; Attorney-General, Thomas M. Vance; Superintendent of Instruction, Frank J. Browne; Land Commissioner, O. R. Holcomb; Judges of the Supreme Court, E. C. Million, Richard Winsor; Members of Congress, F. C. Robertson, J. T. Ronald.

The candidates of the Prohibition party were: For Governor, R. E. Dunlap; Lieutenant Governor, C. I. Hall; Secretary of State, J. W. McCoy; Treasurer, C. C. Gridley; Auditor, A. W. Steers; Attorney-General, Ovid A. Byers; Superintendent of Instruction, A. H. Sherwood; Land Commissioner, J. C. McKinley; Judges of the Supreme Court, Everett Smith, Thomas Young.

The Socialist-Labor party named: For Governor, ——— McCormick; Lieutenant Governor, Matt Matson; Secretary of State, William J. Hoag; Treasurer, Eric Norling; Auditor, F. B. Graves; Attorney-General, John Ellis; Superintendent, Raymond Bland; Land Commissioner, W. L. Noon; Judges of the Supreme Court, Frank Martin, D. M. Angus.

The Social-Democrats nominated: For Governor, ——— Randolph; Lieutenant Governor, E. S. Reinert; Secretary of State, James H. Ross; Treasurer, J. J. Fraser; Auditor, Charles S. Wallace; Attorney-General, David W. Phipps; Superintendent, John A. Kingsbury; Land Commissioner, Jerome S. Austin; Judges, J. H. May, W. H. White.

Gov. Rogers was re-elected, the vote standing: Rogers, 51,944; Frink, 49,860; Dunlap, 2,103; McCormick, 843; Randolph, 1,670.

For all the other State officers and for members of Congress the Republican candidates were elected. The Legislature elected has 26 Republicans in the Senate and 60 in the House, and 8 Democrats in the Senate and 20 in the House.

A constitutional amendment was submitted to vote at this election. It authorizes the Legislature to exempt from taxation \$300 of personal property for every head of a family. It was carried by a vote of 35,398 to 8,975.

The State voted for President as follows: McKinley, 57,456; Bryan, 44,833; Woolley, 2,363; Debs, 2,006; Malloney, 866.

WEST AFRICA. The west coast of Africa north of the Congo State and the regions of the interior as far as the Egyptian Soudan have been divided between France, Great Britain, and Germany, save the republic of Liberia, which has suffered encroachment at both extremities, the small Spanish and Portuguese settlements on the Guinea coast, and the arid region south of Morocco, to which Spain lays claim, although France has claimed the greater part of it.

French West Africa.—The French possessions were reorganized under the decree of Oct. 17, 1899, by placing the region of the middle Niger under a separate military administration and uniting the western part of the Soudan province with Senegal. By the convention concluded between France and Great Britain on June 13, 1899, the boundary between the British Gold Coast and the French sphere is fixed on the north at 11° of north latitude; the limit between Dahomey and the British colony of Lagos extends in a northerly direction till it strikes the Niger 10 miles above Gere, and from that point the line runs up the Niger 7 miles to the dry river bed called Dallul Mauri, up that to a point 100 miles from Sokoto, round the arc of a circle, keeping the same distance from Sokoto, to its second intersection with the parallel of 14° of north latitude, then due east for 70 miles, south to 13° 20' of north latitude, east again for 250 miles, then north to 14° of north latitude, and then east to the shore of Lake Chad. All the countries north and east of Lake Chad were recognized in another Anglo-French convention as belonging to the French sphere, as far east as the watershed of the Nile. France thus extends her recognized sphere over the whole of the Sahara and the Libyan desert, and includes in it the partly civilized kingdoms of Wadai and Bagirmi. The French Congo, which has a coast line on the Atlantic from the Congo to the German colony of Kamerun, is separated from the latter by a line following, with some deviations, the meridian of 15° east of Greenwich, and comprises all the interior north of the Congo and Ubangi rivers, merges in the new French sphere in the north. The French Congo, Dahomey, and Senegal all come together in the interior of the great shoulder of Africa and through the Sahara are connected with Algeria and Tunis.

The *French Congo* has an estimated area of 425,000 square miles and from 12,000,000 to 15,000,000 inhabitants. Libreville, the capital, has about 3,000 inhabitants. The Commissioner General is A. Grodet, and the Lieutenant Governor of the Congo under him is J. B. P. Lemaire. The budget for 1900 makes the income and expenditure each 5,576,000 francs. The imports in 1898 were 4,844,000 francs, of which 1,274,000 francs came from France; exports, 5,695,000 francs, of which 1,488,000 francs went to France. The postal traffic was 7,821 letters, etc., in the internal and 363,717 in the international service; receipts, 16,000 francs; expenses, 57,000 francs. Including the military territory and the protectorates of the Lake Chad region the jurisdiction of the Commissioner General extends over 1,160,000 square miles.

Dahomey, with its dependencies, has an area of 125,000 square miles and a population of about 1,000,000. Col. Liotard, the Governor, has his residence at Porto Novo. The budget of income and expenditure for 1900 was 2,200,000 francs. The imports in 1899 were valued at 12,348,000 francs, and the exports at 12,719,000 francs. The postal traffic in 1897 was 29,102 internal and 73,818 foreign letters, the receipts being 25,000 francs, the expenses 80,000 francs. Porto Novo

has 50,000 inhabitants, and Abomey, the capital of the Dahomey kingdom, has 15,000. The Fon negroes who inhabit the country are skilled in agriculture, raising manioc, yams, and corn, and obtain oil and cocoanuts from the forests. A joint commission met in February, 1900, on the Opepara river at its intersection with 9° of north latitude, the point up to which the boundary between Dahomey and Nigeria was settled, and proceeded to delimit the French and English spheres northward to Gere, on the Niger, according to the terms of the convention of June 14, 1898. They also fixed the position of the two enclaves on the Niger to be leased by England to France, one of them between Liaba and the confluence of the river Mussa, the other on one of the estuaries of the Niger.

French Guinea, including Futa Jallon, has an area of about 48,000 square miles and a population estimated at 1,000,000. Konakry, the capital, is on the isle of Tombo. The Governor is M. Ballay. The revenue raised locally was 1,571,000 francs and the contribution of France 224,625 francs. The imports in 1898 were 9,019,875 francs in value, 1,453,400 francs coming from France, and the exports were 7,799,975 francs, 420,725 francs going to France. A railroad from Konakry to the Niger has been begun. Earthnuts, rice, millet, gum, and rubber are the chief products, and the natives of Futa Jallon raise cattle. In 1899 the value of the imports was 15,442,000 francs, and of the exports 9,863,000 francs. Of the imports 1,621,000 francs came from France, which took 962,000 francs of the exports. Konakry was a free port until in January, 1900, an import duty of 5 per cent. ad valorem was imposed.

Senegal within its extended limits has an area of 200,000 square miles and a population of 1,180,000 without and 3,800,000 including the military territory of the Soudan. N. E. Ballay, the Governor of Senegal, with residence at St. Louis, is also Governor-General of West Africa. The receipts and expenditures of Senegal for 1900 were estimated each at 7,139,602 francs. The imports in 1898 were 33,156,000 francs in value; exports, 28,190,000 francs. Of the imports France supplied 28,190,000 francs, and of the exports 23,176,000 francs went to France. The post office handled 388,774 internal and 775,174 foreign letters, etc., in 1898. In Senegal there are 164 miles of railroad, and in the Soudan 98 miles.

The *Ivory Coast* colony has an area of 100,000 square miles, including the kingdom of Kong, and a population of 2,500,000. The local revenue, which sufficed for the expenditures, was 1,290,000 francs. The Governor, residing at Grand Bassam, is M. Robardeau. The imports in 1899 were valued at 6,390,000 francs, and exports at 5,863,000 francs. Of the imports 1,621,000 francs came from France, and of the exports 2,627,000 francs went to France. The natives grow corn and rice and gather rubber and cocoanuts. Coffee planting is successful.

The imports of the *French Soudan* in 1898 were valued at 10,730,000 francs, and exports at 3,627,000 francs. The administrative territory of the Soudan extends from the western part of the bend of the Niger, Lake Debo marking the boundary between it and the territory under the administration of the civil Governor at St. Louis, across the whole of Africa to the borders of the Nile basin, and from the Sahara southward to the northern limits of the Ivory Coast colony, the British Gold Coast, the German protectorate of Togoland, Dahomey, and British Nigeria. There are two military territories, the western one de-

pendent on Senegal and the eastern one on the French Congo. The area is roughly estimated at 300,000 square miles, with 2,500,000 inhabitants. Timbuktu, the chief town of the western section, has about 12,000 inhabitants, and is a trading center for all this part of Africa. There were 3,408 troops in 1900, of whom 2,750 were natives. The expenditure of France for the Soudan in 1900 was 6,833,000 francs. The local budget of income and expenditure was 3,238,500 francs. The chief imports are cotton goods, and the largest export is caoutchouc. The agricultural products are millet, rice, wheat, and earthnuts.

The Sultan Rabah, who defeated the Bretonnet party in 1899 and compelled M. Gentil to return toward the French Congo with the other half of the expedition, and who was himself defeated by the larger force, under Capt. Robillot, that the Commissary General of the French Congo sent with M. Gentil, fled northward to Dikao, the capital of Cobalo, with the remnant of his army of 12,000 men that remained faithful after the disastrous battle in which nearly a quarter of that army fell. The French could not reap the full fruits of their victory because half their own men were disabled. Their march to Lake Chad was postponed, and they remained near Kuna, awaiting re-enforcements, while their steamer was sent down the Shari to meet the mission of M. Foureau which had come across the Sahara, but halted in the desert on learning that Rabah dominated the shores of Lake Chad. The Sultan of Bagirmi, who had taken refuge at Lai when Rabah defeated his army and usurped his throne, joined Capt. Robillot at Tunia, and the Sultan of Goaurang and other Soudanese chieftains whose power had been shattered by Rabah joined hands with the French, who with a small detachment had beaten their former conqueror and destroyed his strong place, although his artillery was served by trained gunners and his soldiers were armed with repeating rifles and were experienced shots.

In April the three missions that were sent to Lake Chad in 1899—the Gentil-Bretonnet mission from the French Congo, re-enforced anew from its base; the Central Africa or Voulet mission, whose leader went mad and killed Col. Klobb, who was sent to supersede him, led afterward by Capt. Joalland, next in command to Capt. Voulet, in conjunction with Lieut. Meynier, who succeeded to the command of Col. Klobb's party; and the Foureau-Lamy mission from Algeria—effected a junction at Kussuri, and by direction of M. Gentil the combined force marched on April 22, under Major Lamy, against Rabah, who had reassembled an army and was preparing to attack the French. Rabah's troops were concentrated near the French fort, numbering 5,000 men, 2,000 of them armed with modern rifles, with 600 horses and 3 guns. The French column consisted of 700 men armed with rifles, 30 horsemen, 1,500 Bagirmi auxiliaries, and 4 guns. After an exchange of artillery fire the French stormed Rabah's fort of palisades and earthworks, and when his men scattered tried to cut off their retreat, which the Sofas endeavored to cover by resuming the offensive. Major Lamy and Capt. de Cointel were killed, and 18 men, and 3 officers and 5 men were wounded. Rabah's army was utterly routed, and he himself, helpless from wounds, was decapitated by a black soldier. The French placed Omar Ibn Ibrahim, of the former dynasty, on the throne of Bornu, the last one that Rabah, the former slave of Zobeir Pasha, had usurped. The shores of Lake Chad were found to be desolate because they had been ravaged and depopulated by Rabah's bands, but the valleys were found to be fertile. After the victory

the French column, under the command of Capt. Reibell, marched on Dikoa, where Fadifallah, son of Rabah, had rallied an army even stronger numerically than the one with which Rabah had marched against the French, consisting of 5,000 men armed with rifles and a large number of irregulars. This army fled, however, at the approach of the French column of 700 rifles, 100 Bagirmi horsemen, 3 Soudanese spahis, and 3 guns. Capt. Robillot occupied Dikoa, while Capt. Reibell with 160 men and 1 gun gave chase, and on May 2 captured Fadifallah's camp, together with stores, treasure, and ammunition after a sharp engagement. Another fortified camp was taken on May 7, and, Fadifallah's power having been broken, this column returned and was disbanded. During the rule of Rabah the trade between Bornu and Tripoli practically ceased, and that with the Central Soudan became precarious and intermittent. But the trade with Wadai, under the new Sultan Ibrahim, became active once more.

British West Africa.—The colonies of the Gold Coast, Lagos, Gambia, and Sierra Leone have their boundaries inland defined in the recent conventions, and Nigeria also has its limits fixed, though it extends inland to Lake Chad and includes extensive productive and populous territories and the navigable water ways of the lower Niger and the Benue.

The *Gold Coast* has an area of 40,000 square miles and a population estimated at 1,473,882, exclusive of Ashanti and Adansi. Accra has 16,267 inhabitants, and Cape Coast Castle 11,614. The principal products are palm oil and kernels, rubber, and gold, which is found in numerous places and is being mined with European capital. A railroad from Sekondi to Tarkwa is being built and has been surveyed to Kumassi, the capital of the Ashanti kingdom subjugated in 1896. By the convention concluded with Germany on Nov. 14, 1890, the disputed zone between the Gold Coast and German Togoland, which was held neutral pending a settlement, has been divided by a line following the course of the river Daka up to 0° of north latitude and then running northward with deflections that leave Marapusi on the English and Yendi and Chakosi on the German side. There are 688 miles of telegraph. The Governor of the Gold Coast colony is Sir F. M. Hodgson, and the administrator of the northern territories is Lieut.-Col. H. P. Northcott. The revenue, £224,718 of it from customs, amounted in 1898 to £258,851, the expenditure to £377,976. An advance of £578,000 for railroads and £98,000 for harbor improvements was authorized in the colonial loans act of 1890. Previous to this none of the West African colonies had any debt. The value of imports in 1898 was £1,101,546, cotton cloth amounting to £230,641, spirits to £86,837, and tobacco to £21,725. The value of exports was £992,998, of which £551,667 stand for rubber, £114,288 for palm oil, £66,378 for kernels, and £63,838 for gold dust. The vessels entered and cleared during 1898 were in the aggregate of 1,122,016 tons.

The golden stool, which was the symbol of sovereignty in the kingdom of Ashanti, has never been seen since the downfall and imprisonment of King Prempeh in 1896. Prempeh before surrendering had two faithful servants bury it in the ground, probably also the royal treasure, which is supposed to be immense, and none besides them know the spot. When Sir Frederic Hodgson visited Kumassi city at the end of March, 1900, he found the people greatly excited, and learned that the cause was the discovery that some of the Kumassi chiefs had made or pretended to have

made of the golden stool. The search for the golden stool and for King Prempeh's buried hoard of gold has been going on ever since the British established themselves in Kumassi. Both natives and British officials have been active and persistent in the quest. When Sir Frederic Hodgson heard of the rediscovery of the golden stool he determined to get possession of it lest the Ashantis should set up a king and begin a serious rebellion. He determined also to get the royal hoard if it was found. He heard that the natives had twice sent money to Prempeh in Sierra Leone, and warned them that if they did it again their former king would be taken farther away. He called for the payment of 50,000 ounces of gold that the British Government had demanded in 1874, to which the cost of the expedition of 1896 would be added, and he peremptorily demanded of the chiefs the delivery of the golden stool, on which he should sit as the representative of the British Crown. When the chiefs failed to bring him the golden stool the Governor sent out detachments to search for it. The natives organized parties that resisted and attacked the detachments, killing some of the men and wounding others. Then the Governor, sending for re-enforcements, which speedily arrived, attempted to arrest some of the chiefs as ringleaders, upon which the whole Kumassi tribe rose in rebellion. The Governor retired to the strong stone fort that the British had built when they first occupied the country. It was armed with 6 7-pounders and 4 Maxims commanding the town, and was defended by 300 Hausa soldiers, having provisions for three months. The nearest British posts on the north were Kintampo, 100 miles, and Gambaga, 340 miles away, and the march from the coast was over 100 miles through a continuous morass, for it was the rainy season, when native troops could move but slowly and European troops not at all. In addition to the West African frontier force, numbering at the time over 4,000 men, the greater part of them stationed in Nigeria, there was an armed constabulary of 1,300 men in the Gold Coast colony, one of 800 Hausas under 20 British officers in Lagos. By orders from England 300 of the frontier force were sent from Nigeria overland through the Gaman country to the relief of the Kumassi garrison and 200 more by way of Forcados to the Gold Coast. A contingent of the Lagos constabulary set out at once when news of the siege arrived. From Sierra Leone 52 of the frontier force and 250 Hausas were sent later. Major A. Morris, commissioner of the northern territory, commanding the garrison at Gambaga, started on April 18, when he received an appeal from the Governor for aid, with his whole force of Hausas, Moshi cavalry, and native auxiliaries, and at Kintampo he picked up the detachment stationed there, so that his force consisted of 7 white officers, 230 non-commissioned officers and men, and native levies, with machine guns.

When the insurrection began many of the people took the side of the British, and there was fighting among the tribes before the rebels became strong enough to lay close siege to the fort. The Bekwais, whose country lies next to that of the Kumassis on the side toward the coast, undertook to keep communications open, but ceased aggressive acts when the Kumassis came and killed 500 of their number. On April 23 Capt. Parmenter, who commanded the garrison, sent a force to clear the way to the eastward which killed a great many rebels, but two days later they closed in on the fort, and began to build a ring of stockades around it, which were made proof against the light ordnance with which it was armed by means of earth embank-

ments. They first made a determined attack on the town in such strength that the Hausas were driven from their cantonments and compelled to concentrate round the fort. The garrison lost heavily, while inflicting on the rebels losses so severe that in spite of their numerical superiority they remained on the defensive thenceforth, camping behind the stockades that they erected and gradually strengthened, and keeping the Hausas closely confined within their own works. The besiegers numbered about 10,000, many of them good marksmen with their breech-loading rifles, for which they made cartridges themselves that were destructive in their effect. The line of intrenchments held by the Hausas surrounded the fort at a distance of 300 yards. The Lagos constabulary entered the fort on April 30, after two days of severe fighting, in which they had 135 casualties. The Ashantis, 8,000 strong, had erected a stockade across the road at Asagu, 2 miles from Kumassi, which they defended with pertinacity with their native weapons and some rifles. The Kumassis were joined in the rebellion by the Unansis, Ofensus, Atchumas, Beuposus, Ajasus, Nkoranzas, Mampons, Nsutas, Kokofus, Abadones, and Asuatins, all determined to throw off the British yoke and able to muster 50,000 fighting men.

Major Morris sent messages to the Nkoranzas, before resuming his march from Kintampo on May 9, to induce them to remain loyal. When he reached their town he found that the Ashantis had come and seized the King to compel him to take their side, but that the King's sister had persuaded him still to hesitate, and thus the adherence of this powerful tribe was secured by the fortunate arrival of the British force at that moment. The Ashantis contested the way from that point. At Sekedumassi the relief column encountered the enemy, who made an ambush in the tall grass, from which they were easily driven by the machine guns. The British force marched so rapidly that the Ashantis were not well prepared. Every town and village that the British passed through they burned. Most of them were deserted, the Ashantis falling back to concentrate near the capital. On May 14 the native auxiliaries walked into an ambush. There was incessant fighting on May 15 as the force approached the capital. The Ashantis had prepared a strong stockade across the road, which was carried after a cannonade by a charge in which Major Morris, leading his men, was wounded badly; but from a hammock he continued to direct the operations. A second stockade, 6 feet high, on which the 7-pounders made little impression, was likewise taken by assault, and the advance of the Hausas was so rapid that the Ashantis were disconcerted and did not defend their third and strongest stockade. A further march of 10 miles brought them to the line of stockades with which the Ashantis had invested the fort. There were none of the enemy at the particular stockade encountered, and in the evening the relief force marched into the fort without further opposition, having in the day's fighting killed several hundred Ashantis, including some important chiefs.

The town was invested on every side with a circle of very strong stockades with a radius of a mile, each one facing the fort, 6 feet in height, and loopholed at the top. They were made of heavy timbers banked up with earth, each connected with the next ones by paths, so that every fort could be quickly re-enforced. Other columns endeavored to press on to the relief of the garrison when it became known that it was short of provisions, but the Ashantis resisted the ad-

vance of the different detachments with great pertinacity. Capt. Hall with the first detachment of the relieving force got as far north as Esumeja, 16 miles from the capital, and was forced to retire when he found Kokofu on his right flank held by 8,000 Ashantis. Col. Borroughs, on attempting to advance by way of Kokofu, lost 72 men killed or wounded, and had likewise to fall back. The advance detachments of Col. Willcocks's force were accompanied by thousands of native auxiliaries. Capt. Hall went to Bekwai with his force, Col. Carter followed to Kwisa, and Capt. Melliss halted at Kumsu, having found his way blocked by rebels who gave him a hard battle at Dunpoassi. The rebels took the offensive against the advanced guard and several severe battles were fought. Col. Carter was compelled to fall back from Kwisa. The loyal Bekwais alone stopped the advance of the rebels.

The arrival at Kumassi of Major Morris and his men gave to the garrison an able commander and an accession of brave soldiers, but this was not sufficient to raise the siege, and only added to the difficulties of the situation, because ammunition and food were running low. Reconnoissances in force revealed the enemy in strong force at every stockade that was attacked. Relief from the coast was constantly expected, but when rations were reduced until the soldiers got only a biscuit and a half a day and five ounces of meat, when the native traders who obtained 10s. apiece for biscuits and £3 for a can of corned beef had no more to sell, and when 30 or 40 of the native civilians and camp followers died daily of starvation, the situation became desperate. Major Morris directed the reconnoissances to the discovery of a track by which he could get out of town. On June 23, when there were only three days' minimum rations for the entire garrison left, he led the greater part of the besieged out in a heavy mist at early dawn. The force was 600 Hausas of all ranks, with 800 noncombatants, escorting the Governor and his wife and the other British civilians, and followed by 1,000 native civilians. One of the stockades was forced by hard fighting, and during the day's rapid march of 18 miles bands of Ashantis were encountered continually. The march through swamps and deep rivers was more deadly than the enemy after the first two days. Major Morris managed to throw the pursuing Ashantis off the track by making a rapid march to the west after deluding the besiegers into the belief that he intended to strike for the coast by the direct route. The carriers lost their loads, and every one was near a collapse when the column reached Cape Coast on July 11. During the march the casualties were 2 officers killed, 1 wounded; 80 men killed, and 37 wounded.

The force left to hold the fort under Capt. Bishop was 100 men with provisions for twenty-four days. The advance of the main relief column under Sir J. Willcocks was extremely arduous and slow, as the rivers were in flood and rains were incessant. Before he encountered the enemy in force Col. Willcocks knew of the departure of the Governor, and could plan his march so as to reach Kumassi before the food in the fort was entirely exhausted. Col. Willcocks could not start from the coast until he had enough carriers. Thousands were sent from Sierra Leone and other colonies, but thousands more were needed to transport the stores and ammunition. The natives of the Gold Coast refused to go at any price. The labor ordinance requiring them to work for the Government was put into force. The men then ran away, and the authorities impressed the wom-

en into the service. The main force did not set out until June. The chiefs of all the loyal tribes were required to put as many levies into the field as they could raise. The force that advanced on Kumassi under the immediate command of Col. Willcocks was composed of 700 Yorubas and Hausas of the West African frontier force, 230 of the West African regiment from Sierra Leone, and 49 of the frontier police, with 3 15-pounder and 4 7-pounder guns and a plentiful equipment of Maxims. There were also 200 natives allies, who were to act as scouts, but their guns were taken away from them because when they first saw the enemy they fired wildly among the carriers in their excitement. Col. Willcocks deceived the enemy by spreading a report that he intended to march through Kokofu, northeast of Kumassi, and would attack that place on July 13. This drew a large part of the rebel force in that direction, and they were building stockades in the paths on that side while he took his column 15 miles to the west, and marched upon Kumassi by way of Ekwanta. Before entering the hostile district his road went through the country of the Bekwais, old enemies of the Kumassis, without whose aid the British could not have accomplished their purpose. The march into the enemy's country was made in a torrential rain through swamps where the water was waist-deep. The hostile villages were taken at the point of the bayonet. There was no severe fighting until the stockades guarding the approach to Kumassi were reached, built directly across the path, yet hidden in the trees, having pits behind them in which men reloaded the rifles of the combatants who lined the breastworks, and having paths leading back into the jungle to afford a safe line of retreat. The bush was so dense that the men had to cut their way through with *machetes* in order to charge. When the British commander succeeded in locating the first of the hidden stockades and opened fire with his guns, the rebels replied from every direction with rifle fire. They had places built high in the trees to fire from. They had also felled trees and placed brush entanglements to impede the advance of the British troops, but their fire was not destructive, because as soon as it opened from any quarter the Maxims soon cleared the place of rebels. Four such stockades along the road and one large one across the road were taken by successive charges after a heavy bombardment, and the shells had done such terrible work that no one opposed further the entry of the relieving force, which Col. Willcocks led into the fort at sunset on July 15, the very day that he had promised. Out of 3,400 native soldiers employed during the hostilities 850 and out of 200 British officers 55 were killed or wounded.

Col. Willcocks left 150 men in the fort and brought away the sick and famished garrison that could not possibly have resisted an onset of the Kumassis if these had attacked. From his base at Bekwai he sent Col. Morland, on July 21, with 800 men to take Kokofu. The place was surprised and the stockade carried without loss. On Aug. 4 he dispatched 750 troops to Kumassi to destroy the stockades near the town. When the road was opened between Bekwai and Kumassi flying columns were sent out in various directions, which scoured the country and cleared away all signs of hostility for miles about Kumassi. Capt. Wilcox met with a check early in September near Bohankra, 15 miles east of Kumassi, which was retrieved by Major Reeve, who with 400 men inflicted punishment on the district. The Ofensua tried to surround the force sent to occupy their

town. At the end of September Col. Willcocks dispersed a force of 4,000 rebels northwest of Kumassi which fought with desperate courage, giving way only after three bayonet charges. This was the last considerable rebel force still in the field, and when it was broken up by Major Cobbe, who chased the rebels beyond the Ofin river, the work of pacification became easy.

Lagos lies between Southern Nigeria and the French colony of Dahomey. The colony proper has an area of 985 square miles and 85,607 inhabitants. The Lagos protectorate, including the Yoruba country, has about 21,000 square miles, with 3,000,000 inhabitants. The principal products are palm oil, palm kernels, rubber, ivory, gum copal, cotton, cacao, and coffee. Spirits, cotton goods, tobacco, and hardware are imported. There is a railroad from the town of Lagos to Abeokuta, 60 miles, and it is being continued to Ibadan. The Governor is Sir William McGregor. The revenue collected in 1898 was \$206,444, of which £170,792 were derived from customs; expenditure, £203,803. The value of imports was £908,351, of which £339,779 were for cottons, £77,062 for spirits, and £21,043 for tobacco. The value of exports was £882,329, of which £362,539 represent palm kernels, £97,337 palm oil, and £285,410 rubber. The tonnage entered and cleared during 1898 was 822,378 tons. An advance from the British Government of £792,000 for railroad construction was authorized by Parliament in 1899.

Nigeria has an area of about 400,000 square miles and perhaps 30,000,000 inhabitants. There are populous towns, such as Kano with 100,000, Ilorin with 50,000, Yakoba with as many, and Bida with 90,000 inhabitants. The territory is divided for administrative purposes into Northern and Southern Nigeria by a line running from Owo east to Ashaku. The import and export duties levied by the Royal Niger Company have been abolished since the territories passed into the control of the Crown. The revenues for the northern territory will be apportioned by the Ministry of the Colonies in London from those collected in Southern Nigeria and in Lagos. In 1899 the revenue of the Niger Coast protectorate, since merged in Southern Nigeria, amounted to £169,568, of which £160,753 came from customs. The value of imports was £732,640, and of exports £774,648. The number of vessels entered was 379, of 559,912 tons, and cleared 375, of 551,555 tons. Northern Nigeria embraces the Fula empire of Sokoto, with the tributary sultanates of Gandu, Kano, Katsena, Banchi, Bakundi, Donga, Takum, Muri, Zaria, Ilorin, Nupe, and the British part of Adamawa; also a large part of the former kingdom of Bornu and of the Borgu group of pagan states. The Hausas, who form a majority of the population, though subject to the Fula rulers, have long been sought as soldiers by the European administrations in Africa. The people of these Mohammedan states possess a considerable degree of civilization, and are especially skilled in growing and weaving cotton and in curing leather. They raise also a desirable kind of indigo. The Hausas are the traders of the country, and send their caravans northward to Tunis and Tripoli and eastward to Egypt. The British maintain 2,500 native troops in the country under the command of Col. Willcocks. The High Commissioner of Northern Nigeria is Brig.-Gen. F. J. D. Lugard. Southern Nigeria, inhabited by pagan tribes, produces or exports palm oil and kernels, ivory, rubber, ebony, camwood, indigo, gum, barwood, and hides. A military force of 800 native soldiers is maintained. The High Commissioner is Sir R. D. R. Moor, and the Deputy Commissioner is Major H. L. Gall-

wey. The Royal Niger Company had an ordinance forbidding the sale of spirituous liquors north of 6° 12' of north latitude. The British Government maintains the prohibition for Northern Nigeria, most of whose inhabitants are Mohammedans, and intends to establish a zone between 7° of north latitude, the boundary between the northern and southern territories, and 6° 12' within which spirits may be sold but not stored in large quantities, the object being to prevent any smuggling into Northern Nigeria.

The occupation and subjugation of Nigeria was prosecuted vigorously after the Imperial Government had taken the direction of military affairs from the Royal Niger Company and collected a large force to oppose the extension of the French sphere into the region of the middle Niger. In 1899 the towns in the Kwo Ibibio country made their submission after 19 of their number had been destroyed. The resistance of the chiefs in the Benin territory was broken by the occupation of Benin city, the occupation of 4,000 miles of territory and burning of rebellious villages, and the capture and execution of Ologboshi, the leader of the hostile chiefs. In 1900, though amicable relations with the Sultan of Sokoto and the Fulani chiefs were cultivated, the British still encountered much opposition to their occupation of the country, which they endeavored to break down by punitive expeditions. In extending the telegraph from Lokoja up the Benue river to Ibi the troops were attacked by the Munchi people, who killed several European officers and soldiers as well as native soldiers, and were not brought to submission until considerable re-enforcements arrived to punish them. Parties were dispatched by Gen. Lugard in various directions to seek a healthy site for the seat of the new Government, the valleys of the Niger and its principal tributaries being very unhealthy. One of them, commanded by Lieut. Monck-Mason, which explored the Gurara river, was attacked and several casualties occurred, the leader himself being wounded. The columns led by Col. Morland up the Kaduna tributary of the Benue and by Lieut.-Col. Lowry Cole up the Kwokwana tributary on their return united in an expedition to punish the troublesome pagan town of Limu, and met with heavy fighting, in which most of the Europeans were wounded before the town was taken.

The West African frontier force that has been organized to establish British rule throughout Nigeria consists of 2 battalions of infantry, 3 batteries of artillery, 1 company of engineers, with a telegraph section, and an admirably equipped hospital service. The rank and file are drawn in about equal numbers from the Hausa and Yoruba tribes, with a sprinkling of Nupes. Jebba, 500 miles up the Niger, was made the headquarters, but nearly half the force was stationed at Lokoja, 200 miles farther down, where the Niger is joined by the Benue. A battalion consists of 8 companies of 150 men, each having 3 British officers and 5 British noncommissioned officers, with a Maxim and gun detachment, the men being armed with Lee-Enfield carbines. Two of the batteries consist each of 4 7-pounder guns and the third of 6 Maxim-Nordenfelts. Col. Willcocks is in command of the entire force, and each battalion is commanded by a lieutenant colonel. Other divisions of the West African frontier force are assigned to the other possessions, the total strength being 5,400 men, of which number 2,500 are allotted to Northern Nigeria, 1,000 to Southern Nigeria, 700 to Lagos, and 1,200 to the Gold Coast colony and protectorate. The political and territorial powers of the Royal Niger Company were transferred to the British

Crown on Jan. 1, 1900. A part of the territories previously administered by the chartered company were attached to Lagos protectorate. The rest was amalgamated with the Niger Coast protectorate, and divided into Upper and Lower, or Northern and Southern, Nigeria—Lower Nigeria administered by Sir Ralph Moor, with the title of High Commissioner; Upper Nigeria, including the kingdom of Sokoto, the subjugated state of Nupe, and the healthy districts north of the lower Benue, administered by Gen. Lugard as British High Commissioner. The British Government paid to the bondholders of the Royal Niger Company £120 for each £100 of stock, or a sum of £300,000, and to the shareholders £150,000 for land and mining rights and compensation for interruption of business, £300,000 in repayment with interest of sums advanced by the company in excess of revenue to develop the territory, and £106,895 for stores, buildings, steamers, etc., making a total of £856,895. The company retained some of its stations and a part of its fleet of river steamers and prepared to carry on its commercial operations as before, relieved of the expense of political administration and military protection, but deprived of the monopoly of trade, which, however, it sought to perpetuate by taking in other companies and firms trading in Nigeria.

The rebellion of the Ashantis of the Gold Coast protectorate had a disturbing effect throughout West Africa. In Nigeria it roused a dangerous temper among the Fulas, whom as the ruling caste the British have taken great pains to conciliate. Bishop Tugwell with 5 companions and a caravan of 200 carriers was on the way to Kano, the capital of Hausaland, when the Ashanti outbreak occurred, and 500 of the Nigerian division of the West African frontier force were dispatched to the relief of the British besieged in Kumassi. At Florin and other places the native potentates received the English party with honors, and at Zaria the local chief treated them hospitably, but at Kano they were ordered by the king to leave his country on pain of death, and when they reached Zaria on the way back the chief was no longer friendly. The Emir of Sokoto refused to allow the British to erect a telegraph in his dominions. Kontagora, who calls himself King of the Soudan, was openly hostile, and sent his horsemen to attack British detachments whenever they approached his country.

Sierra Leone, lying between Liberia and French Guinea, has an area of about 4,000 square miles and 74,835 inhabitants, more than half of whom are Christians, many of them descended from liberated West Indian slaves. In the schools there are over 6,000 pupils. Palm oil and kernels, earthnuts, benni seed, kola nuts, rubber, gum copal, and hides are exported. A railroad from Freetown, the capital, to Songotown, 30 miles, is continued 30 miles farther to Rotofunk, and will be extended onward to the confines of the protectorate, which has an area of 30,000 square miles and about 375,000 inhabitants. The Governor is Sir Frederic Cardew. The revenue in 1898 was £117,682, of which £89,524 came from customs; expenditure, £121,112. A loan of £310,000 from the British exchequer has been authorized for railroad construction. The imports in 1898 amounted to £606,349, of which £134,674 were for cotton cloth, £23,639 for spirits, and £18,724 for tobacco. The value of exports was £290,991, of which £112,063 represent palm kernels, £52,504 rubber, and £49,671 kola nuts. The vessels entered and cleared in 1898 had an aggregate tonnage of 1,110,228 tons. In the spring of 1900 a rising of the Youngies in the Ronietta district had to be put

down by a detachment of the West African regiment. In September a disturbance occurred in the Karene district of the protectorate, provoked by the conduct of an officer of the frontier police. In November Sir Frederic Cardew, whose policy caused the insurrection of 1899, retired and was succeeded as Governor by Sir C. King-Harman. The imposition of a heavy hut tax on the natives of the protectorate who had only recently been brought under British control, and also the mode in which it was collected, was the cause of the rising and massacres, and it was so reported by Sir David Chalmers, who went out as royal commissioner to investigate the charges against the Governor and the district commissioners. The Secretary of State for the Colonies did not act at the time upon the findings of the royal commissioner because they contained serious accusations against public officials, but after a sufficient interval Sir Frederic Cardew was replaced. He had imposed the hut tax with the approval of the Colonial Office in order to raise the money within the colony and protectorate to support the force of frontier police that was organized primarily to counteract the military power of France in the *Hinterland* and bring as much territory as possible under British influence. The arbitrary conduct of the district commissioners, who are chiefs of the frontier police as well as judicial officers, having the power to inflict capital punishment, although not men of legal training, continued to give occasion for complaints, as also the conduct of the frontier police, composed entirely of natives, many of whom had been slaves of the chiefs whom they arrested and accused.

Gambia has an area of 69 square miles and 14,300 inhabitants within the colony, Bathurst, the capital, having 6,000; and the protectorate has an area of 2,700 square miles and 200,000 inhabitants. The exports are earthnuts, hides, beeswax, cotton, and rubber, and the natives cultivate also corn and rice. The Administrator is Sir R. B. Llewelyn. The income in 1898 was £46,718, and expenditure £29,035. The revenue from customs was £33,762. The value of imports was £246,092, of which £60,787 were for cotton cloth, £4,373 for spirits, and £7,190 for tobacco. The exports were £247,832 in value, the chief articles being earthnuts for £200,309 and rubber for £30,468. The vessels entered and cleared during 1898 had an aggregate tonnage of 328,145 tons. In June, 1900, the Mandingoes attacked two British traveling commissioners on the banks of the Gambia river, and killed them and their escort.

German West Africa.—The German possessions are Kamerun and Togoland, both declared German protectorates in 1884. Kamerun has an area of about 191,130 square miles, with 3,500,000 inhabitants. There were 348 German, 36 English, and 39 other white residents in the middle of 1899. In a botanic garden at Victoria experiments are made with economical plants of the tropics with a view to introduce cultures suited to the climate. Plantations of cacao, coffee, and tobacco have been started. The value of imports in 1899 was 10,638,955 marks. The exports amounted to 5,145,822 marks, the principal articles being palm kernels for 1,365,608 marks, palm oil for 893,361 marks, gum for 1,928,080 marks, ivory for 598,471 marks, and cacao for 813,115 marks. The imports consist mainly of cotton cloth, spirits, salt, and hardware. During 1899 the number of vessels that visited the ports was 66, of 81,891 tons. A district of 34,000 square miles in the northwest has been conceded to the Northwest Kamerun Company authorized to promote immigration and to carry on agricultural,

mining, and trading enterprises. Gold and iron are known to exist. The revenue in 1899 was 1,713,000 marks, including a contribution from the Imperial Government. For 1900 the revenue was estimated at 3,245,000 marks. The imperial contribution was 2,063,000 marks, and the local revenue was 1,000,000 marks from customs, 32,000 marks from direct taxes, and 150,000 marks from other sources. For 1901 the Reichstag has voted 1,197,700 marks as the imperial contribution. The Governor in 1900 was J. von Puttkamer. The Imperial Government has given little financial aid of late years to Kamerun, and has kept only a small garrison there. Having determined that the protectorate must pay its own way, it adopted the policy of concessions to syndicates, to which the smaller capitalists who had invested money there objected. An increase in the import duties made in 1899 was also a discouraging circumstance. German planters had invested 8,000,000 marks, and have had success with cacao, with coffee on the slopes of the Kamerun mountains, and with tobacco. Their trouble has been to obtain laborers; 8,000 are needed, and only 4,000 have been found, and most of these are brought from Liberia, Lagos, and Togoland. The Kamerun natives cost less if they can be induced to work. Revolts occurred in 1900 that made it impossible to get any. An expedition was sent to Adamawa in 1899 to protect the tribes in the center from attack, and while the troops were away the Bali tribe, from which laborers had been recruited, rose in rebellion and destroyed the Catholic mission at Kribi on the coast. In the northern part of the colony all plantations had to discontinue work because no laborers could be obtained in consequence of the destruction of a weak military post by hostile natives. An expedition to the north was first sent out under Capt. von Besser in order to punish the Bangs tribe for murdering the explorer G. Conrau and Lieut. von Queis, who had been left in command of a station and to establish German authority in the region where the new Northwest Kamerun Company had begun operations. The Bali insurrection shut out from the coast the Yaunde people, who were accustomed to bring rubber to the merchants and hire out to the planters for a term before their return, and also the capable Tikar people, who had begun to come down from Adamawa. Capt. von Dannenberg, temporarily commanding the forces, had not men enough left to punish the Bali. The Reichstag voted in favor of adding 100 men to the colonial troops, and the Imperial Government arranged in the budget for the addition of 500 more, raising the total strength from Jan. 1, 1901, to over 1,000 men. The recruiting of labor in Liberia was made difficult and expensive by a tax imposed by the Government of the republic on all laborers who emigrate. The Governor of Togoland stopped the supply even from a German possession, forbidding the emigration of laborers, but after a conference of persons interested in Kamerun plantations held in Berlin at the invitation of the Government Dr. von Bucka, the director of the Colonial Department, abrogated the decree. Harsh treatment of natives on the plantations was alleged as one cause of the difficulty of obtaining labor in the back country, and excesses of the troops were said to be one cause of the native risings. Major von Kamptz, the commandant, when he returned to Kamerun recalled Capt. von Besser because he was charged with having committed excesses in his punitive expedition.

Togoland has an area of 33,000 square miles

and a population estimated at 2,500,000. There were 118 Europeans in 1899. The revenue for 1900 was estimated at 750,000 marks, of which 20,000 marks came from direct taxes, 425,000 marks from customs, 35,000 marks from various sources, and 270,000 marks were contributed by the Imperial Government. The expenditures were 311,650 marks for salaries, 228,720 marks for materials, and 550,000 marks for public works. The Governor is M. Köhler. The imports in 1898 were 2,490,925 marks, and in 1899 they were 3,279,708 marks; exports in 1898 were 1,470,454 marks, and in 1899 they were 2,582,701 marks. The military force consists of 250 native troops with German officers. Palm oil and kernels and gum are the chief exports. Palms have been planted in great numbers, and also coffee shrubs and gum trees. Cattle have been introduced in the hilly back country. In 1899 the number of vessels that visited the ports was 95, of 110,241 tons. Arrangements were made in November for the partition of the neutral zone of Salaga between Togoland and the British Gold Coast colony. Germany laid claim to the greater part of this region, but agreed to divide the territory in accordance with the British claims and desires in consideration of the relinquishment of the British treaty right to the joint control of Samoa with Germany and the United States.

Spanish West Africa. — Apart from the islands of *Fernando Po*, *Annabon*, *San Juan*, and *Corisco*, in the Bight of Biafra, Spain possesses territory on the mainland, and has claimed the whole coast line from the Campo river in the north nearly down to the Gabun river, known as the *Muni* territory, although France has always disputed this claim and has asserted authority in these regions, while Spain has done little in the way of effective occupation. Spain has also since 1855 asserted a protectorate over the coast south of Morocco from near Cape Juby, opposite the Canary Islands, to Cape Blanco on the south, the region known as the *Rio de Oro* protectorate. No limits were laid down to the extension of the protectorate in the interior, and when the doctrine of *Hinterland* was accepted in the agreements between France, Germany, and Great Britain, it was assumed by Spain that her claim extended indefinitely inland, and asserted a protectorate, which was not made effective, over the *Adrar* country lying back of the coast. France, however, contested this claim, has made many sacrifices in order to bring under her dominion the whole Sahara, and has always contested the Spanish right to a *Hinterland*. An agreement was reached early in July, 1900, between the French minister and the Spanish ambassador in Paris which brought to a close the long-standing disputes. In return for concessions on the Guinea coast Spain gave up her pretensions in the western Sahara, abandoning all claim to *Adrar* and accepting a line between the Spanish and French spheres of influence in northwest Africa to be drawn in such a manner as to leave the *Sebkha Ijil*, a saline lake less than 200 miles from the coast, within the French sphere. Of the *Rio de Oro* and *Adrar* protectorates, 243,000 square miles in extent, Spain retains less than 100,000 square miles, and renounces the prospects of extending her influence from the insignificant points on the coast where Spanish authority is now exercised. These settlements are under the control of the Governor of the Canary Islands, which are considered for administrative purposes a part of Spain.

In the south Spain claimed a territory in the *Rio Campo* and *Muni* valleys of 69,000 square

miles, containing 500,000 inhabitants, and regarded as an exceedingly fertile and promising region. France was unwilling to recognize any of it as Spanish except the trading posts opposite Corisco. As compensation for the concessions in the northwest France now concedes only a fraction of the Spanish pretensions in the Muni district, but still a considerable tract of country which is capable of commercial development. The coast line, about 75 miles in length, from the Campo river, the southern boundary of German Kamerun, to the Muni river, is conceded to be Spanish, and inland the line is drawn about 10° 30' east of Greenwich, giving a breadth of about 110 miles to the Spanish possession, which has thus an area of over 8,000 square miles, and is known as a fertile agricultural region through which the river Benito flows. The agreement provides that France is to have the right of pre-emption should Spain at any time decide to alienate the territory, while Spain has a similar right of pre-emption over the Adrar country. Near Cape Nun Spain has a settlement called *Ifni*, inclosed inland by British territory and having an extent of only 27 square miles and 6,000 inhabitants.

Portuguese West Africa.—South of the Congo Portugal possesses the old colony of *Angola*, having a coast line of 1,000 miles extending from the Congo to the Cunene, the two rivers dividing it respectively from the Congo State on the north and German Southwest Africa on the south, and stretching inland to the borders of the Congo State and British South Africa. The total area is 484,800 square miles, and the population is estimated at 4,119,000. A military force of 4,010 men, of whom 2,858 are natives, is maintained to preserve order. The revenue for 1900 was estimated at 1,673,111 milreis, and expenditure at 2,013,671 milreis. The imports in 1897 were 6,380,368 milreis, and exports 6,577,791 milreis. There are 244 miles of railroad and 807 miles of telegraph line. The ports of Angola were visited in 1897 by 615 vessels in the foreign trade, of 1,053,248 tons, and 2,547 in the coasting trade, of 70,743 tons. Coffee, rubber, wax, oils, coconuts, ivory, cattle, and fish are the important products, and sugar is grown from which rum is distilled. Gold has been discovered, as well as copper, iron, petroleum, and salt, and the *Mossamedes Company*, composed of German capitalists, has a concession for mining, breeding cattle, and colonization in a vast healthy tract in the interior. *San Thomé* and *Príncipe* are salubrious volcanic islands in the Bight of Biafra on which creole planters raise cacao, coffee, and cinchona. Their area is 360 square miles, with a population of 24,660. The revenue for 1900 was estimated at 404,196 milreis, and expenditure at 322,732 milreis. The imports in 1898 were 1,663,914 milreis, and exports 2,536,978 milreis, including 1,825,776 kilogrammes of coffee, 8,323,057 kilogrammes of cacao, and cinchona bark valued at 29,686 milreis. The *Cape Verde Islands* are inhabited by a colored race descended from Portuguese settlers and negroes from all parts of the Guinea coast. The area is 1,480 square miles, and the population is 114,130. The revenue for 1900 was estimated at 364,120 milreis, and expenditure at 319,941 milreis. Imports in 1898 were valued at 1,558,047 milreis, and exports at 194,608 milreis. The products are coffee, medicinal drugs, and millet. The islands were visited in 1898 by 3,225 vessels, of 3,365,137 tons. *Portuguese Guinea* is surrounded on the land sides by French Guinea and Senegal. The capital is on the island of *Bolama*. The area, defined in the convention with France signed in

1886, is 4,440 square miles, and the population is about 820,000. The commercial products are rubber, wax, oil seeds, ivory, and hides. The revenue for 1900 was estimated at 56,655 milreis, and the expenditure at 216,742 milreis. The value of imports in 1898 was 458,566 milreis; exports, 223,136 milreis.

WEST INDIES. The West Indian islands are colonies of European powers with the exception of the large islands of Hayti-Santo Domingo, Cuba, and Porto Rico. Their population consists of the descendants of former negro slaves, with a sprinkling of white creoles, who have in recent times declined in numbers through emigration. The islands have gone through a long depression, due to the competition of European beet sugar with cane sugar, which is still their principal product, though on some of the islands it has been replaced by other crops. Great Britain imported from the British West Indies in 1898 sugar for £232,378, rum for £106,223, cacao for £446,498, and dyewoods for £33,820, all imports amounting together to £1,283,413, while British exports to the islands were valued at £1,839,980, the chief articles being cotton goods for £450,244, clothing for £203,533, leather and leather goods for £93,433, iron goods for £119,534, fertilizers for £76,103, and machinery for £44,210. Flour and provisions are imported into the West Indies from the United States and jerked beef from the Argentine Republic and Uruguay. Of 9,167,767 tons of shipping entered and cleared in 1898 at British West Indian ports 7,239,354 tons were British. In consequence of the economical crisis in the British West Indies, aggravated by destructive hurricanes in the cases of Barbadoes and the Windward Islands, the British Parliament in 1899 authorized advances from the treasury amounting to £663,000, of which £150,000 were loaned to Jamaica to cover deficits and £303,000 to construct public works and railroads, £110,000 were allotted to Trinidad for railroads and public works, £50,000 go to Barbadoes to repair the damages of the hurricane, and £50,000 for the same purpose to St. Vincent. A royal commission appointed to inquire into the condition of the sugar-growing colonies recommended these loans for temporary relief. The conclusion of the commission was that there is danger of reduction and even of extinction of the sugar industry from the competition of bounty-fed sugar, and yet in many of the islands there is no other industry that could profitably take its place.

British Colonies.—The largest of the British islands is *Jamaica*, which has 4,424 square miles, including Turks and Caicos Islands, the Caymans, and the Morant and Pedro Keys. The area of Jamaica itself is 4,193 square miles. The population in 1899 of Jamaica was 730,725; of Turks and Caicos Islands, 5,482; of the Caymans, 4,322. There are 635 miles of telegraph on the island of Jamaica, and 185 miles of railroad. The Governor is Sir Augustus Hemming. The Legislative Council contains 5 official, 6 nominated, and 14 elected members. Kingston, the capital, has 46,542 inhabitants. The white population of the colony in 1891 was 14,692. In 1896 there were 14,118 East Indian immigrants settled on the island, including 1,562 indentured laborers. Immigration was suspended in 1886, but in 1891 it was resumed. There were 893 public schools in 1899 with 96,252 pupils enrolled and 56,853 in average attendance. The British garrison in 1899 numbered 1,620 officers and men; the Jamaica militia, 761. The cultivated area in 1898 was 660,491 acres, of which 164,307 were tilled and 373,048 were pasture. Sugar cane covered 27,123.

coffee 22,901, bananas 23,405, coconut palms 11,293, cacao 1,527, ground provisions 77,271, Guinea grass 123,136, pimento and pasture 62,418, pimento alone 4,993 acres. The shipping in 1898 consisted of 134 sailing vessels, of 9,220 tons. In Turks and Caicos Islands there were 46, of 6,080 tons. The number of letters and postal cards sent through the post office in 1899 was 4,791,102; the number of telegraph messages, 97,368. The revenue of Jamaica in 1898 was £748,514, and expenditure £752,742. Of the revenue £336,398 came from customs. The chief expenditures were £107,315 for debt charges, £61,150 for police, and £60,405 for public works. The value of the external commerce was £1,814,793 for imports and £1,662,543 for exports. The import of cotton goods was £254,007; of fish, £151,569; of flour, £145,639; of rice, £104,146. The export of sugar was £150,311; of rum, £104,295; of coffee, £162,219. The tonnage entered and cleared was 1,827,719 tons. The revenue showed an improvement over that of the previous year owing to an increase in the import duties and a tax on cigars and cigarettes, but was less than in 1895 and 1896, while expenditure was considerably greater. The imports showed an increase of 7 per cent. and the exports an increase of 15 per cent. over those of the preceding year. Of the imports less than half came from Great Britain and the rest mainly from the United States, to which 60 per cent. of the exports were shipped, as fruit constitutes now 40 per cent. of the total exports. The sugar also goes to the United States, instead of to England, as formerly, while rum, logwood, coffee, and pimento are sent to England. Cotton goods, boots and shoes, and other articles of cheap quality but good appearance are imported from America in preference to English wares, so that in 1899 the United States for the first time took the lead of Great Britain in the import trade. The revenue for 1901 is estimated at £765,286, and expenditure at £756,991. The estimate of revenue was £144,527 more than the estimate for 1900, chiefly because an estimate of £125,000 for railroad receipts was included. After a long controversy with the railroad company the Government took possession of the railroad on Aug. 15, 1900. A line of steamers has been started to run direct from Jamaica to England in twelve days, each ship to carry at least 20,000 bunches of bananas and the other fruits and products of the island. A subsidy of £40,000 a year will be paid, partly by the Imperial and partly by the colonial Government. The growing of fruit in Jamaica is an industry that has sprung up in the last twenty years, and owes its existence to American enterprise and capital. The fruit exports in 1896 amounted to 4,000,000 bunches of bananas, 10,000,000 coconuts, and 100,000,000 oranges. The value of fruit exported in 1898 was over £630,000, of which £620,000 went to the United States.

The *Bahama Islands* have an area of 4,465 square miles, with 53,256 inhabitants in 1898. The Governor is Sir Gilbert T. Carter. There is a Legislative Council of 9 members and a Representative Assembly of 29 members elected by the people with a low property qualification. The number of births in 1898 was 2,164; of deaths, 1,224; excess of births, 940. There were 44 public schools with 5,998 children enrolled and 4,050 in average daily attendance. The sponge fisheries in 1898 yielded £105,038. Shells, pearls, and ambergris are other sea products. Pineapples of the value of £24,360 were exported, including canned fruit. The value of the orange crop was £3,061. Sisal plants covered 20,000 acres. The value of all imports was £238,336 in 1898, of which £53,

430 were for cotton goods and £28,880 for flour. The exports were valued at £174,860. The tonnage entered and cleared was 741,522 tons. The revenue in 1898 amounted to £86,760, of which £63,571 were derived from customs; expenditure, £64,148, of which £7,754 went for public works, £7,935 for the debt, and £5,316 for police. The debt amounted to £118,426.

The *Leeward Islands* comprise Antigua, with Barbuda and Redonda, St. Kitts, with Nevis and Anguilla, Dominica, Montserrat, and the Virgin Isles. They have an aggregate area of 701 square miles. The population at the census of 1891 was 127,723, comprising 5,070 whites, 23,320 colored, and 99,333 blacks. There were 137 schools with 25,122 pupils. Sugar and molasses are grown generally on the islands, except where the sugar cane has been superseded by fruit crops. Antigua produces pineapples as well as sugar; Montserrat, sugar, coffee, cacao, arrowroot, and limes, the juice of which is exported in bottles; St. Kitts and Nevis, sugar and rum; Anguilla, vegetables and salt; the Virgin Islands, sugar and cotton on small farms owned by the negroes themselves, and phosphate of lime from the island of Sombbrero; Dominica, Liberian coffee, cacao, limes, and other fruits. The value of imports in 1898 was £3,943 for the Virgin Islands, £122,968 for St. Kitts and Nevis, £105,103 for Antigua, £19,818 for Montserrat, and £60,260 for Dominica; of exports, £3,855 for the Virgin Islands, £138,222 for St. Kitts and Nevis, £79,178 for Antigua, £13,849 for Montserrat, and £63,912 for Dominica. The imports of cottons into the Leeward Islands were £40,630, and of flour £41,997. The exports of sugar were £175,885 in value; of cacao, £26,360; of lime juice, £25,753. The tonnage entered and cleared in the Virgin Islands was 11,307; in St. Kitts and Nevis, 493,329; in Antigua, 429,168; in Montserrat, 208,430; Dominica, 456,998. The revenue of the Virgin Islands in 1898 was £1,715, and expenditure £1,784; the revenue of St. Kitts and Nevis was £40,430, and expenditure £44,659; the revenue of Antigua was £39,663, and expenditure £55,586; the revenue of Montserrat was £6,199, and expenditure £11,936; the revenue of Dominica was £24,569, and expenditure £24,648. The debt of Montserrat was £17,300; of St. Kitts, Nevis, and Anguilla, £74,450; of Antigua, £137,471; of Dominica, £70,900. Of the revenue of the Virgin Islands £823, and £23,583 in St. Kitts, Nevis, and Anguilla, £21,160 in Antigua, £3,543 in Montserrat, and £11,716 in Dominica came from customs duties on imports.

The *Windward Islands* are Grenada, St. Vincent, the Grenadines, and St. Lucia. The area is 550 square miles, and the population in 1898 was 154,598, of which number 47,976 were in St. Lucia, 237 square miles in extent; 44,000 in St. Vincent, having an area of 147 square miles; and 62,622 in Grenada and the Grenadines, of which the area was 166 square miles. The Governor is Sir Alfred Moloney. In Grenada cacao has supplanted sugar, covering 11,115 acres, and spices are grown on 1,343 acres. St. Vincent, besides sugar and rum, produces spices, cacao, and arrowroot. The products of St. Lucia are sugar, cacao, rum, and logwood. The imports of St. Lucia in 1898 were valued at £271,995, and exports at £93,415; imports of St. Vincent at £95,551, and exports at £44,666; imports of Grenada at £210,783, and exports at £257,274. There were 38 public schools in Grenada in 1899, with 8,386 pupils; 36 schools in St. Vincent; and 39 schools in St. Lucia, with 5,280 pupils. The revenue of St. Lucia for 1898 was £67,268, and expenditure £60,975; the revenue of St. Vincent was £27,361, and expenditure

£27,674; and the revenue of Grenada was £62,870, and expenditure £57,602. Of the expenditure of St. Lucia, £10,686 was on public works, including £4,566 for repairing damages caused by a hurricane, and £13,177 were for the debt; in Grenada £9,600 were spent on public works, and £1,633 in St. Vincent. The tonnage entered and cleared in the foreign trade in 1898 was 1,557,677 tons in St. Lucia, 254,825 in St. Vincent, and 434,198 in Grenada. The value of sugar exported from St. Vincent was £14,610, and of arrowroot £14,518; of cacao from Grenada £227,655, and of spices £22,107; of sugar from St. Lucia £51,569, and of cacao £25,377. The imports of cottons into St. Lucia were £25,150, and of flour £16,444 into St. Lucia and £11,341 into St. Vincent. The public debt of St. Vincent amounted in 1897 to £17,040, that of Grenada to £127,670, and that of St. Lucia to £189,580. Customs duties yielded £32,261 of the revenue of St. Lucia, £32,713 in Grenada, and £13,600 in St. Vincent.

Barbadoes has an area of 166 square miles, with about 190,000 inhabitants in 1896. Bridgetown, the capital, has 21,000. There are 175 Government schools, with 14,734 pupils in average daily attendance. The British garrison consists of 32 officers and 815 men, the island being the headquarters of the European troops in the West Indies. The Governor is Sir James Shaw Hay. There is a House of Assembly of 24 members elected for each yearly session by the people under a restricted franchise which admitted 1,992 voters in 1898. The 9 members of the Legislative Council are appointed. About 100,000 acres, nearly the entire surface of the island, are in cultivation, 30,000 being planted with sugar cane. The yield of sugar has recently increased, amounting in 1898 to 53,575 hogsheads. The export of manjak, or glance pitch, for fuel was 1,160 tons in 1898, valued at £2,320: This is a bituminous substance the value of which is increasing, and which is frequently found, but the veins run irregularly and the broadest and most promising ones sometimes fail suddenly. The fisheries, in which 370 boats are engaged, produce £17,000 annually. The shipping consists of 47 sailing vessels and 2 steamers, of an aggregate tonnage of 7,372 tons. There is a railroad 24 miles long. The total value of imports in 1898 was £1,058,855, of which £133,823 were for cotton goods, £71,020 for fish, £70,622 for rice, and £67,691 for flour. The value of exports was £769,231, of which £150,311 represent sugar and £92,416 molasses. The vessels entered and cleared during 1898 were of an aggregate amount of 1,320,014 tons. The Government collected a revenue of £182,582, of which £97,020 came from customs; and the expenditures were £175,319, the chief item being £23,442 for police. The debt amounted to £414,000. In 1899 the revenue amounted to £216,022, including the hurricane loan from the Imperial Government. The expenditure was £207,883, including £30,000 for repairs necessitated by the hurricane of 1898, mostly for rebuilding the huts of the laboring population. The exports in 1899 amounted to £845,590, the chief exports being 43,907 tons of muscovado sugar, worth £439,070; 2,312 tons of dry sugar, worth £34,680; and molasses of the value of £109,252. Most of the exports go to the United States. The imports were valued at £998,006. The imports of rice and fish show a decline, indicative of poverty and distress among the poorer people of this overcrowded island. The Government helps poor whites to emigrate to the United States and Canada. The sugar planters and the people employed on the plantations look to the Government to aid them in introducing new machinery and modern

processes by which they can extract more juice from the cane and a better quality of sugar than they can sell profitably in Canada or perhaps in England, as they expect to lose the market that they now have in the United States.

The area of *Trinidad* is 1,754 square miles, with a population estimated in 1898 at 260,000. Port of Spain, the capital, had 34,037 inhabitants. The number of marriages in 1898 was 1,100; of births, 7,962; of deaths, 6,755; excess of births, 1,207. In 204 schools, which receive a Government grant of £35,924, there were 24,866 pupils in 1898. Of the total area of the island, which is 1,120,000 acres, 442,924 acres are cultivated, 57,000 acres being planted with sugar cane, 103,000 acres with cacao, 1,500 acres with coffee, 18,500 acres with ground provisions, and 14,000 with cocoanuts. The Governor is Sir H. E. H. Jerningham, who is assisted by a Legislative Council of 9 official and 11 nominated members. The pitch lake in the center of Trinidad is Crown property leased to an English company, which exported 100,208 tons of asphaltum in 1898. There is a railroad 31 miles long. The length of telegraphs is 690 miles. The value of imports in 1898 was £2,283,056, and of exports £2,310,133. The importation of flour was £152,797; of textile goods, £315,632; of rice, £35,772. The sugar exports amounted to £603,285; cacao, £812,270; molasses, £16,593. The vessels entered and cleared had a total tonnage of 1,163,722 tons.

The island of *Tobago* was annexed to Trinidad in 1889, and in 1899 was made a ward of Trinidad. The area is 114 square miles, with 21,000 inhabitants, who cultivate cotton, tobacco, and cacao, as well as sugar. The revenue collected in 1898 was £8,213; expenditure, £7,479. The value of imports was £10,855, and of exports £21,443; shipping entered and cleared 25,751 tons.

British Guiana has an area of 109,000 square miles and a population computed in 1898 at 286,222, more than a third of whom are Africans, and a still greater proportion East Indians. The number of births in 1898 was 8,500, and of deaths 9,706. Georgetown, the capital, has 53,176 inhabitants. The number of coolie immigrants in 1899 was 2,193; the number returned to India, 1,238. There are 208 aided schools, with 28,689 pupils. The Governor is Sir Walter J. Sendall. The Court of Policy consists of 7 official members and 8 elected by the qualified voters, 2,815 in 1899. The revenue in 1899 was £525,865, of which £304,366 came from customs, £85,548 from licenses, £34,292 from the duty on rum, and £21,209 from the royalty on gold. The expenditure was £525,387, of which £157,690 was for the civil establishment, £22,593 for ecclesiastical affairs, £29,754 for the judiciary, £27,653 for education, and £21,106 for public works. The public debt was £975,791. Of 79,278 acres under cultivation sugar occupies 69,814 acres, divided between 74 estates. The value of sugar exports in 1899 was £1,040,982; of molasses, £11,968; of rum, £144,712; of balata, £28,153; of gold, £415,746. Mining began in 1886, and in ten years the value of gold produced was £2,796,300. In 1897 the yield was 126,702 ounces; in 1898, 125,080 ounces; in 1899, 112,464 ounces. The total value of imports in 1899 was £1,371,412, and of exports £1,775,691. The imports of flour were £139,088 in value; of tissues, £192,570; of rice, £105,631; of machinery, £48,963; of fertilizers, £70,412; of fish, £57,274; of coal, £37,156; of hardware, £82,711. There are 40 miles of railroad, 559 miles of Government telegraphs and cables, and 677 miles of telephone lines. The number of vessels belonging in the colony in 1898

was 48, of which 33, of 1,682 tons, were sailing vessels, and 15, of 1,171 tons, steamers. More than half the imports come from Great Britain, and a quarter from the United States, and the exports go mainly to those two countries, the United States taking the larger share. The export of gold was less in 1899 than in previous years, owing to the exhaustion of the richer deposits that were being worked. New ones have not been discovered, but investigations point to a wider extent of auriferous lands than was believed to exist. Cacao, rice, kola, and tobacco are products that have lately been introduced to take the place of the sugar cane. The Government encourages the settlement of small homesteads. Of the total area of the colony only a fringe on the coast and on the river banks is cultivated. The forests of the interior contain beautiful cabinet woods, and rubber and other valuable gums.

French Colonies.—The French island of *Guadeloupe* has an area of 583 square miles itself, and the dependent islands of Marie Galante, Les Saintes, Désirade, St. Barthélemy, and St. Martin being added, the total area of the colony is 688 square miles. *Guadeloupe* had 170,195 inhabitants in 1897. The population of the dependencies is 23,605. The Governor is D. Moracchini, residing at Basse Terre. The revenue in 1900 was estimated at 4,908,324 francs, and expenditures at the same, France giving 1,632,950 francs to cover the deficiency of local revenue. The value of imports in 1899 was 18,451,000 francs, and of exports 18,251,000 francs. The post office in 1896 handled 586,880 internal and 606,468 international letters, etc. There are about 15,000 Indian coolies on the island. The rest of the population, except the white planters, is African. The economical situation is worse than in Martinique, and the negro population for want of employment has become impoverished.

The area of *Martinique* is 381 square miles. The population in 1894 was 187,692. The expenditures in 1900 were calculated at 5,729,793 francs. The French Government bears about 35 per cent. of the total expenditure. The Governor is G. Gabrié, residing at Fort-de-France. The value of imports in 1898 was 27,005,000 francs, and of exports 26,603,000 francs. Of the imports, 14,182,000 francs came from France. The postal traffic in 1894 was 695,064 internal and 893,595 foreign letters and other mail matter. A battalion of marine infantry and 2 batteries of artillery are kept in Martinique, and there is a company of colonial gendarmery on each of the islands. The Government is constantly in financial difficulties. The feud between blacks and whites causes difficulties in addition to those that arise from the depression of the sugar industry. The creoles are few and, hampered by want of capital, are unable to devise new occupations for the laborers whom they can no longer profitably employ on their sugar plantations. Excepting the planters and some thousands of coolies, the whole population is black or colored, descendants of African slaves. About half the imports come from France, which receives practically the whole of the exports from both islands.

French Guiana is administered by a Governor, L. Mouttet, assisted by a Council General of 16 members. The population is 30,310, including 3,900 convicts and 1,800 convict settlers. There are 1,500 Indians. The area is estimated at 30,260 square miles. The revenue in 1900 was estimated at 2,380,940 francs, including a contribution from the French Government, which expended 6,899,061 francs on the colony in 1900, but of this 5,450,550 francs were for the penal establishment. Guiana

was made a penal settlement in 1885, and since then habitual criminals and all who are sentenced for more than eight years are sent there. The labor of the convicts is now employed for general purposes with good results. Crops are rice, corn, manioc, cacao, coffee, sugar, indigo, and tobacco, though the area cultivated is small. Rum, cacao, coffee, phosphates, and cabinet woods are exported. The exports of gold were 74,646 ounces in 1897, 48,000 ounces in 1898, and 81,715 ounces in 1899. Gold is found mainly in alluvial deposits, though quartz veins are also worked. The import trade has fallen off greatly, but the exports tend to increase. The interior is covered with dense forests, and the country is exceedingly unhealthy and thinly populated. More than a third of the population live in the town of Cayenne. Silver and iron mines are worked besides the deposits of gold and phosphates. The gold fields in the south that were claimed by France have been awarded to Brazil under the arbitration convention of April, 1897, but they have been developed by miners from French Guiana.

Dutch Colonies.—The island of *Curaçao*, with the dependencies of Aruba, Bonaire, St. Eustache, Saba, and the Dutch part of St. Martin, has an area of 403 square miles, that of *Curaçao* by itself being 210 square miles. The population in 1898 was 51,524. The number of marriages in 1898 was 203; of births, 1,583; of deaths, 942; excess of births, 641. The Governor is C. A. H. Barge, residing at Willemstad. The revenue in 1898 was 517,485 guilders; expenditure, 687,529 guilders, leaving a deficit of 170,044 guilders. The number of vessels that visited the island in 1898 was 1,074, of 1,266,000 cubic metres. The post office forwarded 36,272 internal and 489,080 external letters; receipts, 73,000 francs; expenses, 58,000 francs. The value of imports in 1898 was 1,960,000 guilders.

Danish Colonies.—Denmark has the islands of *Santa Cruz*, *St. Thomas*, and *St. John*, which combined have an area of 138 square miles. Their population at the census of 1890 was 114,229, of whom 53,429 were males and 60,800 females. The imports in 1898 were valued at 3,103,000 kroner, and exports at 3,059,000 kroner. The Governor is Col. C. E. von Hedemann. The indebtedness of the colonies to the mother country amounts to 12,000,000 kroner. It has been proposed that the United States discharge this debt and assume the sovereignty of the islands if the Danish Government be willing to make the transfer. The islands have long been a financial burden to the home Government, and their trade with Denmark is constantly decreasing.

WEST VIRGINIA, a Southern State, admitted to the Union June 19, 1863; area, 24,780 square miles. The population, according to each decennial census since admission, was 442,014 in 1870; 618,457 in 1880; 762,794 in 1890; and 958,800 in 1900. Capital, Charleston.

Government.—The following were the State officers in 1900: Governor, George W. Atkinson; Secretary of State, William M. O. Dawson; Treasurer, M. A. Kendall; Auditor, L. M. LaFollette; Attorney-General, Edgar P. Rucker; Superintendent of Schools, J. R. Trotter; Adjutant General, J. W. M. Appleton; Librarian, P. S. Shirkey; Bank Examiner, O. B. Wetzel, succeeded in May by C. B. Kefauver; Secretary of the Board of Agriculture, J. B. Garvin; Commissioner of Labor, I. V. Barton; Mine Inspector, J. W. Paul; Fish and Game Warden, Frank Lively—all Republicans; Presiding Judge of the Supreme Court of Appeals, Marmaduke H. Dent; Associate Judges, John W. English, Henry Brannon, and H. C. Mc-

Whorter; Clerk, J. A. Holley—all Democrats except Judge McWhorter, who is a Republican.

State officers are elected for terms of four years at the time of the presidential elections, and are inaugurated on the 4th of the following March. The Legislature meets biennially in January of the odd-numbered years.

Population.—The increase of population in the past decade was 25.6 per cent., while from 1880 to 1890 it was 23.3 per cent. The census of 1900 by counties is as follows: Barbour, 14,198; Berkeley, 19,469; Boone, 8,194; Braxton, 18,904; Brooke, 7,219; Cabell, 29,252; Calhoun, 10,266; Clay, 8,248; Doddridge, 13,689; Fayette, 31,967; Gilmer, 11,762; Grant, 7,275; Greenbrier, 20,683; Hampshire, 11,806; Hancock, 6,693; Hardy, 8,449; Harrison, 27,690; Jackson, 22,987; Jefferson, 15,935; Kanawha, 54,696; Lewis, 16,930; Lincoln, 15,434; Logan, 6,955; Marion, 32,430; Marshall, 26,444; Mason, 24,142; Mercer, 23,903; Mineral, 12,883; Mingo, 11,359; Monongalia, 19,944; Monroe, 13,130; Morgan, 7,294; McDowell, 18,747; Nicholas, 1,403; Ohio, 48,024; Pendleton, 9,167; Pleasants, 9,345; Pocahontas, 8,572; Preston, 22,727; Putnam, 17,330; Raleigh, 12,436; Randolph, 17,670; Ritchie, 18,091; Roane, 19,852; Summers, 16,265; Taylor, 14,970; Tucker, 13,433; Tyler, 18,252; Upshur, 14,696; Wayne, 23,619; Webster, 8,852; Wetzel, 22,880; Wirt, 10,284; Wood, 34,452; Wyoming, 8,380.

The population of Wheeling is 38,878, an increase of 12.62 per cent. Other incorporated places having more than 2,000 are: Huntington, 11,923; Parkersburg, 11,703; Charleston, 11,099; Benwood, 4,511; Bluefield, 4,644; Charlestown, 2,392; Clarksburg, 4,050; Davis, 2,391; Elkins, 2,016; Fairmont, 5,655; Grafton, 5,650; Hinton, 3,763; Keyser, 2,536; Martinsburg, 7,564; Moundsville, 5,462; New Cumberland, 2,198; Piedmont, 2,115; Sistersville, 2,979; Thomas, 2,126; Wellsburg, 2,588; Weston, 2,540.

Finances.—The official statement of the financial transactions of the State by the Treasurer for the fiscal year ending Sept. 30, 1900, is as follows: Balance in treasury Oct. 1, 1899, to the credit of State fund, \$228,819.96; general school fund, \$387,460.71; the school fund (uninvested), \$518,468.55; balance in treasury, \$1,134,749.22; balance in treasury Oct. 1, 1900, \$119,211.93; total receipts, \$1,806,015.54; total receipts plus balance, \$2,925,227.47; disbursements, \$1,790,478.25; balance, \$1,134,749.22. The school fund (irreducible)—amount invested, \$522,500; balance uninvested, \$518,468.55; grand total, \$1,040,968.55; net increase for the year, \$67,656.16.

The Treasurer says: "The unprecedented appropriations made by the last Legislature gave rise to a well-grounded fear that the treasury would be drained before the next meeting of the Legislature, and that we would be compelled to borrow money. But owing to the fact that collections have been remarkably good and considerable revenue has been received from sources heretofore unproductive, we have been able to maintain a substantial balance in the State fund."

It is explained that the uninvested part of the school fund is not lying idle, but is lent at 3 per cent., payable quarterly. This fund is increasing at the rate of more than \$50,000 a year. In the past four years foreign corporations chartered in the State have paid into the treasury \$494,652.29. Criminal charges for the same period cost the State \$380,000.

Education.—For the four years ending Sept. 30 the State paid for school purposes \$1,555,672.24. The school fund receives all money coming to the State "from forfeited, delinquent, waste, and un-

appropriated lands; and from lands heretofore sold for taxes and purchased by the State of Virginia, if hereafter redeemed or sold to others than this State; all grants, devises, or bequests that may be made to this State for the purposes of education or where the purposes of such grants, devises, or bequests are not specified; this State's just share of the literary fund of Virginia, whether paid or otherwise liquidated; and any sums of money, stocks, or property which this State shall have the right to claim from the State of Virginia for educational purposes; the proceeds of the estates of persons who may die without leaving a will or heir, and of all escheated lands; the proceeds of any taxes that may be levied on revenues of any corporations; all moneys that may be paid as an equivalent for exemption from military duty; such sums as may from time to time be appropriated by the Legislature for the purpose; and all interest from the fund not used for schools is added to the capital."

There is a compulsory school law imposing a fine of \$2 for every day a child is kept from school without a valid excuse, but it seems not to be enforced.

The building of the preparatory branch of the State University at Montgomery has been enlarged, so as to accommodate all the present students. The first student entered the university this year from this school, which has been in operation about four years; the explanation is that as there was no preparatory school in the neighborhood of Montgomery, it was necessary to begin with the very lowest English branches. The State has normal schools at Athens and Huntington.

The State University, at Morgantown, reported this year a larger number of students than ever. About 50 were graduated in June; the law class was unusually small, but the academic classes were large. The legislative appropriation for the past two years was \$196,000. Trouble has arisen among the faculty from the dismissal of two professors, and one of them has entered suit against the president, whom he holds to be responsible.

Militia.—The number of men in the organized militia of the State is given in the Adjutant General's report as 1,093, and the number unorganized, but available for military duty, as 125,000.

Corrections.—At the Girls' Industrial School, at Salem, 39 inmates were present in March. A site across the ravine from the building has been bought, to make a home for colored girls needing the restraint of the institution. Besides industrial training, the girls have school instruction four hours a day.

The daily average of convicts at the Penitentiary for the past three and a half years was 619; the daily cost for maintenance for each, \$0.262; the improvements made from earnings amounted to \$17,944.

Banks.—There were 89 State banks in operation between April 1 and Sept. 30, an increase of 11 since the last report of the Bank Examiner. Certificates of incorporation have been issued to 4 additional banking institutions which had been organized or were in process of organization. The total resources of the State banks for the last two years were as follow: \$21,747,645.58 for 1899 and \$27,430,644.07 for 1900; capital stock (1899), \$3,251,257.10 and (1900) \$3,449,676.40. The increase for the year was \$33,077,953.01 in total aggregate deposits. Surplus funds and undivided profits amounted to \$1,672,328.36, and \$1,410,965.64 for the year 1899. The increase in savings deposits amounted to \$470,640.10, or nearly 48 per cent.

The Montgomery Banking and Trust Company

went into the hands of a receiver, a shortage having been found of about \$25,000, and the cashier was arrested in October.

Railroads.—The statistics of railroad construction credit the State with 225 miles of new track on 10 lines in 1890 and 1900. Contract has been made for the construction of a road along Coal river—the Kanawha, Pocahontas and Coal River Railroad—and part of the work has been done. It will give an outlet for great quantities of coal and timber.

Industries and Products.—The Labor Commissioner's report shows the following figures on the manufactures of the State: Five hundred establishments report 28,334 employees on the pay rolls Jan. 1, 1897; 34,889 employees on the pay rolls Jan. 1, 1899; 40,221 employees on the pay rolls Jan. 1, 1900; an increase of 48 per cent. Average number of weeks in operation year ending Jan. 1, 1900, 46½.

Three hundred and five establishments report an advance in wages rates, affecting 22,553 employees. Three establishments reduced wages, affecting 24 employees.

It is also shown that 298 establishments—mercantile, mining, and manufacturing—started between March, 1897, and January, 1900, report 10,188 employees, \$345,816 paid monthly in wages, and \$22,842,547 capital invested.

The State stands third in regard to coal production, being surpassed only by Pennsylvania and Illinois. The output in 1900 was 22,000,000 tons. In 1890 the State stood fourth, with 7,394,654 tons. The number of men employed at the mines this year was 28,017. Of the quality of the coal, the London Statist said: "Both for 'bunker' purposes and for export it is probable that the coal of West Virginia is destined to take the lead. This State has a far larger coal area than the United Kingdom has, and the seams are so placed that practically all the mining is done by the simple, easy, and economical method of working by adits. It is this State that produces the famous 'Pocahontas' coal, which has been declared by some analysts to be fully equal to the very best coal produced in South Wales—that is to say, to the best in the world. About 5,000,000 tons per annum of this valuable coal are now being turned out, and the most of it finds its way to Norfolk and Newport News for shipment."

The State is second in coke production and first in oil.

From the report of the Board of Agriculture it appears that the season of 1899 was not favorable, and the yield of some crops was below the average, yet the corn crop was estimated at 18,043,584 bushels; wheat, 3,880,751 bushels; oats, 3,158,442 bushels; rye, 132,290 bushels; and buckwheat, 238,255 bushels. Total value, \$16,695,847. Potatoes, 2,672,784 bushels, valued at \$1,398,848; hay, 6,083,031 tons, valued at \$6,083,031.

Lawlessness.—A negro was lynched near Tazewell, April 19, for assault on a young girl. A great excitement was caused at Fayetteville, Dec. 28, among the negroes by the arrival of 25 negroes, arrested at Star for having attempted to lynch Squire Workman at that place on Christmas night. Squire Workman had arrested a negro on Christmas Day for disorderly conduct. Later some negroes tried to rescue the prisoner, and one of them was killed. Then followed the attempt that night to lynch the justice, for which the prisoners were arrested.

Political.—This was the year for electing State officers for the ensuing four years beginning March 4, 1901. There were four tickets—Republican, Democratic, People's party, and Prohibitionist.

The first Republican convention was held at Fairmont, May 8, and delegates were chosen to the national convention. The second convention, for nominating State officers, met in Charleston, July 11. The platform approved the presidential nominations, commended the course of the State's representatives in Congress, denounced disfranchisement of colored voters, opposed the removal of any of the State buildings, and said, concerning apportionment: "In the apportionment for election of members of the Legislature we favor giving to every county at least one delegate, and the abandonment, so far as possible, of the legislative districts, which, while being a plan intended to equalize representation, has been perverted by the Democrats into a partisan scheme to disfranchise counties and voters."

And in regard to Democratic State administration: "We condemn the Democratic party for twenty years of incompetence and bungling, coupled with fraud and embezzlement, in the management of the affairs of the State. We call upon the leaders of that party to explain why it was that commissioners of school lands and delinquent sheriffs were allowed to pocket the people's money and were never called to account; why it was that tons and tons of worthless documents were annually ground through the press at enormous cost to the State, only to lie and rot in the vaults and cellars of the Statehouse; why it was that hundreds of foreign corporations were allowed to do business in this State by paying only one fifth of the amount of license taxes required by law; why it was that the irreducible school fund, which during the last four years has increased at the rate of \$50,000 per annum, only increased \$20,000 per annum when they were in control; why it was that they could not construct a State building without laying a special levy, and making supplemental assessments, and then borrowing money, while the present administration, out of the ordinary revenues, has provided for more public buildings than have ever been constructed in the same length of time in the history of the State, and has not borrowed a cent nor increased taxes; why it was that the Democratic Legislature of 1893 paid \$18,000 out of the State treasury for alleged services in collecting an obligation due this State from the United States Government, which services were absolutely unnecessary, as the United States Government cheerfully paid the full amount of the obligation to the State treasury; why it was that the last Democratic Governor of this State borrowed \$100,000 out of the irreducible school fund for State purposes, paying 6 per cent. interest for it, while at the same time one of his State officers had thousands of dollars of the State's money in his pocket and was paying neither principal nor interest; why it was that the cost of the public printing, binding, and stationery from 1890 to 1896 inclusive, under Democratic control, amounted to a yearly average of nearly \$46,000, while under the present administration it has averaged less than half that amount; and why it was that, with the same resources at their command which the Republicans now control, they were never able to place more than \$1,400,000 at the disposal of the Legislature in any two years, while, with no increased taxation and without borrowing one cent, the present administration in the same period of time has furnished over \$3,000,000."

The eight-hour law was approved, and the rapid development of the industries of the State under Republican administration pointed out. Further, the platform declared: "We are unalterably opposed to the payment of any part of the Virginia debt. That portion of Virginia which now consti-

tutes the State of West Virginia paid its full share of taxes into the treasury of Virginia for almost three quarters of a century, and received but an insignificant share

ALBERT B. WHITE,
GOVERNOR OF WEST VIRGINIA.

of the public improvements for which the Virginia debt was created; and when West Virginia was admitted into the sisterhood of States, the assets which belonged to both of the States were nearly all kept by the mother commonwealth; and yet it was arbitrarily decided by the Legislature of Virginia that West Virginia should pay one third of the indebtedness of Virginia, without any reference to the amount of the expenditure of public moneys for public improvements within what is now the territory of West Virginia, and without giving to West Virginia credit for the amount of taxes paid by her people into the treasury of Virginia. West Virginia has issued no bonds and owes no debt."

The following candidates were named: For Governor, Albert B. White; Auditor, Arnold C. Scherr; Treasurer, Peter Silman; State Superintendent of Free Schools, Thomas C. Miller; Attorney-General, Romeo H. Freer; Judges of the Supreme Court, Henry Brannon and George Poffenbarger.

The Democratic convention met at Parkersburg, June 6. A platform was adopted pledging support to the Kansas City ticket and platform. It denounced trusts, imperialism, the Porco Rican tariff, the Philippine war, militarism, the recent financial act of Congress, the increases of the standing army, and the administration of President McKinley and of Gov. Atkinson. Sympathy was expressed for the Boers. The Nicaragua Canal was strongly favored. A resolution was adopted against recognizing the old Virginia debt in any form.

In an address before the convention ex-Gov. McCorkle arraigned the Republican party in a way that met the approval of the delegates and is interesting for comparison with the extracts given above. He denounced the action of the Secretary of State and the Republican party in defrauding the Democrats of a majority in the Legislature of last year, and denounced the Republican party in this State for its delinquency in allowing the State to be sued on the Virginia debt. He criticised Gov. Atkinson for claiming that the institutions of the State were efficiently managed, and demanded why the present superintendent, who is criticised for his actions all over the State, was allowed to continue in office. He denounced the extravagant and inefficient management of the university; showed that it cost at least four times as much under the present administration and with no more students than with the Democratic administration. He took up the institutions of the State and showed by the appropriations that they had immensely increased in expenditure under the Republican administration; dwelt upon the public printing, binding, and

stationery, and showed its immense increase under Republican management. He showed further that during his administration he had increased the value of railroads \$4,000,000, while, notwithstanding the increase of mileage, the value has been decreased by the Republican administration. He showed that the highest appropriation under the Democratic administration was \$1,300,000, but that under Republican management it had increased to \$2,200,000, the highest ever known in the history of the State. He then took up the question of the material improvement of the State, and showed that the Democratic party had practically made the State what it is, and showed what it had done in the way of creating the school department, building the university and the public institutions of the State, and showed the marvelous progress under Democratic management.

Following is the ticket: For Governor, John H. Holt; Auditor, James H. Miller; Treasurer, J. Garland Hurst; State Superintendent of Free Schools, Robert A. Armstrong; Attorney-General, George M. McCoy; Judges of the Supreme Court, John W. English, William G. Bennett.

The People's party, in convention at Parkersburg, July 5, made the following nominations: For Governor, H. T. Houston; Auditor, W. C. Raleigh; Treasurer, John Beury; Superintendent of Schools, F. E. Ashburn; Judge of the Supreme Court, J. W. Davis. The last named declined.

The executive committee of the Prohibition party named the ticket which follows: For Governor, T. R. Carskadon; Auditor, J. B. McGregor; Treasurer, W. C. B. Moore; Superintendent of Schools, E. E. Mercer; Attorney-General, C. D. Merrick.

The Republican candidates were elected, the vote standing: White, 118,807; Holt, 100,226; Carskadon, 1,373; Houston, 266. The Legislature has 17 Republicans in the Senate and 32 in the House, and 9 Democrats in the Senate and 39 in the House; 9 seats are contested.

The presidential vote was as follows: McKinley, 119,851; Bryan, 98,791; Woolley, 1,585; Debs, 286; Barker, 274.

WISCONSIN, a Western State, admitted to the Union May 29, 1848; area, 56,040 square miles. The population, according to each decennial census since admission, was 305,391 in 1850; 775,881 in 1860; 1,054,670 in 1870; 1,315,497 in 1880; 1,688,880 in 1890; and 2,069,042 in 1900. Capital, Madison.

Government.—The following were the State officers in 1900: Governor, Edward Scofield; Lieutenant Governor, Jesse Stone; Secretary of State, William H. Froehlich; Treasurer, James O. Davidson; Attorney-General, Emmett R. Hicks; Superintendent of Education, L. D. Harvey; Railroad Commissioner, Graham L. Rice; Insurance Commissioner, Emil Giljohann; Adjutant General, C. R. Boardman; Dairy and Food Commissioner, H. C. Adams; Labor Commissioner, Halford Erickson; Bank Examiner, E. I. Kidd; Health Commissioner, F. M. Schultz; Fish and Game Warden, J. T. Ellarson; Tax Commissioners, Norman S. Gilson, George Curtis, W. J. Anderson; Forest Warden, C. E. Morley; Chief Justice of the Supreme Court, J. B. Cassoday; Associate Justices, John B. Winslow and Joshua E. Dodge (Democrats), Charles V. Bardeen and Roujet D. Marshall; Clerk, Clarence Kellogg. With the exceptions mentioned, all are Republicans.

State officers are elected for terms of two years in November of the even-numbered years. The Legislature meets biennially in January of the odd-numbered years. It consists of 33 Senators and 100 Representatives.

Population.—In 1880 the State stood sixteenth in population, and fourteenth in 1890; by this census it is thirteenth. The percentage of increase is 22.6. There are 1,657 Indians not taxed. Statistics of some of the counties are not at hand, but the following data are given: There was an increase in the population of every one of the counties. Milwaukee led with an increase since 1890 of nearly 94,000, the present population of the county being 330,000. Other counties reporting an increase of more than 10,000 are Douglas, 29,000; Marathon, 13,000; Marinette, 10,500. Racine, including the city, gained over 9,000. Dane County gained nearly 10,000, the present population of the county being 69,500. Ashland gained 113 only; Green County exactly the same. But as a rule northern counties gained the most markedly: Wood, 8,000 to her present population of 26,000; Shawano, 8,240 to 27,500; Chippewa, 8,000 to 33,000; Clark County, 8,140 to 26,000.

The gains are large in the cities, some farming towns showing a large percentage of decrease. Milwaukee has grown from 204,186 in 1890 to 285,315 in 1900; Superior City, from 11,983 to 31,091; Racine, from 21,014 to 29,102; La Crosse, from 25,090 to 28,895; Oshkosh, from 22,836 to 28,284. Sheboygan has 22,962; Madison, 19,164; Eau Claire, 17,517. The capital city (Madison) had 13,426 in 1890.

Finances.—In urging reform in the financial management of the State, Gov. La Follette says in his message to the Legislature: "Under the law the fiscal year of the State ends Sept. 30, and all regular official reports are for the term ending on that day. This fact, with a few others closely related to it, I believe to be responsible for much of the public misunderstanding of State finances and for most of the misleading information concerning State affairs upon which legislators have been obliged to rely for guidance. Reports for the fiscal year show balances upon a date within a few weeks after the receipt of large amounts of revenue as license fees from corporations, etc., but months before the close of the administration term—months in which extraordinary disbursements, including legislative expenses in each biennial term, must be made before considerable revenues are again received. The usual and natural result of this system is found in misleading official reports, showing a handsome cash balance at the close of the fiscal year, and four months later a new administration finds itself confronted at the beginning of its term with an alarming deficit as the foundation for new appropriations by the Legislature and the natural and steady growth in ordinary current expenses. At the close of the fiscal year, Sept. 30, 1900, the balance in the general fund of the State was \$496,408.74. At the end of the calendar year and administration term, Jan. 7, 1901, the general fund balance was only \$151,833.77. Of this last balance, \$50,000 is derived from advance payment of railway license fees which do not become due until March. The State aid to free high schools, amounting to \$97,607.83, due Dec. 1, 1900, is unpaid—although the warrants therefor are in the Treasury Department—because available moneys in the general fund are required to meet current expenses. These items, when properly deducted, leave a net balance of \$4,125.94 in the general fund. Legislative and other expenses payable within the next few days will aggregate more than \$100,000, and there is no appreciable amount of receipts due to the general fund from any source before the time for payment of corporation license fees and State taxes, which was changed from February to March by the last Legislature. Besides this inevitable deficit, there

is an additional deficiency of \$323,505.74, being the amount of appropriations by the last Legislature the payment of which has been refused on account of lack of means in the general fund, and which continues as a charge to be paid out of that fund as soon as sufficient moneys 'not otherwise appropriated' shall accumulate therein. In brief, you have a legacy of over \$300,000 excess appropriations from the last Legislature to take into your considerations, and the administration begins business with a considerable treasury deficit in sight, in lieu of the balance which might be expected from the condition of the general fund at the close of the fiscal year as shown by the annual official reports available to the public for purposes of information."

A table is given showing receipts and disbursements for the ten years ending in 1898, from which it is seen that in four of the ten years there was an excess of disbursements over receipts even at the close of the fiscal year; and there was a steady increase in the cost of State government from \$4,894,871 in the first biennial term to \$7,346,947 in the last.

The valuation of property in the State was somewhat higher than in 1899, and the tax levied was \$1,345,570. A 1-mill tax is levied for schools. The university receives \$268,000, the normal schools \$190,000, and the free high schools \$100,000. Interest on certificates of indebtedness takes \$157,570. The cost of State printing for the past biennium was \$118,111.77.

Education.—Following are school statistics of 1900: School population, 731,063; enrollment in public schools, 445,141; teachers, 13,063; graduates of normal schools teaching under county superintendents, 745; number that have attended normal schools, not graduated, 1,399; holding State certificates, 533; average monthly wages of women teaching, \$31.79; of men, \$43.84; average wages of women teaching in cities, \$45.43; of men, \$102.03; expense for each pupil in the country, \$10.81; in cities, \$18.09; expense for teachers' wages per pupil, in country \$7.08, in cities \$11.86; total expenditure for teachers' wages, \$760,211.62; for buildings and repairs, \$585,247.44; for apparatus, furniture, etc., \$119,997.73; number free high schools, 219; number pupils enrolled in free high schools, 17,382; teachers in free high schools, women 339, men 325; pupils in day schools for the deaf, 198.

The receipts for common schools, including free high schools, were \$7,209,578.45; the disbursements, \$5,735,724.45; the receipts for normal schools were \$358,132.23; the disbursements, \$284,759.73. The receipts for the university for the year—including a balance, Sept. 30, 1899, of \$23,808.44—were \$698,944.13; the disbursements, \$592,797.46. For day schools for the deaf the State paid \$23,930.89; for teachers' institutes, \$11,298.55; and for salaries and allowances to county superintendents, \$71,475. The total amount expended was \$6,721,876.08.

The number of diplomas and certificates issued and countersigned by the State superintendent in the school year was 1,048, of which 917 were of normal schools. The number of teachers in rural schools receiving less than \$25 a month was 2,938; those receiving \$25 to \$35 was 4,286; and more than \$35, was 1,693.

The registration at the normal schools has not increased in the past two years. At the university nearly 1,600 were enrolled before the end of September. In March 87 were graduated from the Agricultural College; the total attendance in this department of the university was 252. The dairy school had 113 students in November.

LIBRARY OF THE WISCONSIN HISTORICAL SOCIETY, MADISON.

The number of private schools outside of cities is given as 448, their teachers 645, and pupils 27,213. In cities, 13,301 attended 213 private schools twelve weeks or more, under 825 teachers.

The number of colleges, academies, and seminaries reported, not including those under State or public control, was 19; they paid for instruction \$101,658.

The finest building owned by the State was dedicated in October. This is the Historical Library building on the university campus, Madison. It is of white sandstone, and has cost \$600,000. It was dedicated by the State Historical Society, for whose use it was built. The dedicatory address was made by Charles Francis Adams. The forty-eighth annual meeting of the society was held in the new building in December. The books in the library include 215,606 titles. The sessions of the summer school for library training, supported by the State Free Library Commission, were held this year in the new building.

Charities and Corrections.—The number of inmates in the charitable and penal institutions Oct. 1 was 2,784, and of officers and employees 632, divided as follow:

INSTITUTIONS.	Inmates.	Officers and employees.
State Hospital for Insane.....	424	122
Northern Hospital for Insane.....	585	169
School for the Deaf.....	190	46
School for the Blind.....	105	44
Industrial School for Boys.....	328	54
State Prison.....	496	47
State public school.....	147	45
Home for Feeble-minded.....	394	84
State Reformatory.....	115	21

The current expenses of the 9 institutions for the two years ended Sept. 30, 1900, were \$1,272,370.20, divided as follow: State Hospital for Insane, Mendota, \$218,787.43; Northern Hospital for Insane, Oshkosh, \$260,618.50; School for Deaf, Delavan, \$82,969.80; School for Blind, Janesville, \$71,541.35; Industrial School for Boys, Waukesha, \$136,075.57; State Prison, Waupun, \$164,435.59; State Public School, Sparta, \$84,393.64; Home for Feeble-minded, Chippewa Falls, \$141,576.24; State Reformatory, Green Bay, \$91,981.08.

A new and uniform system of bookkeeping went into effect in all the State institutions Oct. 1.

All expenditures must be audited by the Secretary of State, and all income reported to him.

Militia.—The number of organized militiamen in the State was given in July as 2,745, and the number of men available for military duty but unorganized as 274,116. The expenses of the Adjutant General's department, including the pay of the militia while they were in camp, rents of armories, and salaries, was \$91,093 in 1899 and \$88,512.32 in 1900. Troops were paid \$45,598.71 in 1899 and \$43,638.74 in 1900. In the Pension Department 976 cases were settled, in 404 of which the claims were allowed.

Medical Registration.—The receipts of the State Board of Medical Examiners for the two years from licenses, registrations, and examinations were \$8,772.52, while the expenses were \$7,900.20, a balance of \$863.31 being deposited in the State treasury. The board granted 1,220 licenses at \$5 each, and there were 1,200 registrations at \$2 each.

Railroads.—In the first eighteen months of the operation of the law prohibiting State officials from riding on passes, the expense to the State for transportation of State officials and members of State boards was \$26,632.66. In statistics of railway construction the State is credited with only 86 miles of new track, laid on 8 lines, in the years 1899-1900.

Insurance.—The receipts of the Insurance Department for 1900 were \$431,318.87, an increase of nearly \$50,000 over 1899, and of nearly \$200,000 over 1898, before the new insurance law went into effect, the receipts for 1898 being \$239,774.43. All of this money is turned into the State treasury. The Northwestern Life Company alone paid \$241,636.16. The expenses of the department for the year were about \$13,000, not including payments for publication of statements of the insurance companies, which under the law are charged as expenses of the department, but are paid direct by the companies.

The State is carrying insurance on its buildings to the amount of \$2,600,000, at an annual cost of \$8,064.

Industries and Products.—The latest labor reports available are for 1897-'98. In those years 528 orders were issued requiring guards or protection around dangerous machinery, the erection

of 26 fire escapes was ordered, the repair of 70 unsafe elevators, the guarding or repair of 32 defective or dangerous stairways or other openings, the changing of 16 doors so as to swing outward, the dismissal of 389 children illegally employed. For the same two years the number of establishments inspected was 2,463, with 119,026 male employees and 14,711 female employees. Some of the returns under the "special investigation" into child labor are significant; 215 establishments were visited, employing 33,805 workers, of whom practically 10 per cent. were under sixteen years of age, and of these 4.6 per cent. under fourteen years. The average weekly wages were \$2.69. The inquiry further showed that 31 per cent. had attended public schools and 58 per cent. parochial schools exclusively, and nearly 11 per cent. had attended both of these classes of schools. Also that 82 per cent. were born in the United States and 18 per cent. in foreign countries. That 72 per cent. reported the occupation of the father as that of common laborer, and 28 per cent. as that of one or the other of the skilled trades; that in 60 per cent. of the cases of the 1,216 children who appeared young or weak, and whose homes were visited, the parents owned their home and some other property besides; that of 46 per cent. the father had regular employment; that of 21 per cent. the father was dead; and that of 32 per cent. the father was either sick or out of employment.

Wisconsin, it is said, makes one fourth of the cheese produced in the country; there are 2,000 cheese factories and 1,000 creameries. Green County, which has a large Swiss population, sold \$1,200,000 worth of cheese in 1900.

The report of the Game Warden gives the following data: In 1900 were issued 32,037 hunting licenses, of which 231 were to nonresidents; the license fees aggregated \$32,316, a decrease of \$3,500 from the year preceding. More deer were killed—2,568 shipped in 1900 and 1,953 in 1899; nonresidents killed 104 this year. Of 342 persons arrested for violating the game laws, all but 21 were convicted; fines collected amounted to \$4,800; and there were 190 seizures of nets, spears, etc. Twelve persons lost their lives by being mistaken for deer, and 12 others were seriously wounded.

The last Legislature appropriated \$25,000 for an exhibit at the Pan-American Exposition; the Governor appointed a board of managers, which was organized in March, with W. A. Van Brunt as president and C. E. Reynolds secretary.

Lands.—The area of public land in the State unappropriated and unreserved but surveyed, is given as 313,565 acres; the area reserved, 365,353; and appropriated, 34,595,962. In the fiscal term ending Sept. 30, 1898, the agents sold 63,293 acres of State lands for \$211,871, and it was estimated that those remaining unsold were worth only about \$500,000. The fund from all that have been sold amounts to about \$3,000,000. School districts can borrow from it to build schoolhouses, the limit being 5 per cent. of the valuation of real property in the district, and the time allowed for payment fifteen years.

The Forest Warden reported that there were 99 forest fires in 1900, affecting 163 persons and causing a loss of \$23,906. The cost of extinguishing them was \$1,426. In 1899 there were only 46 fires, involving a property loss of \$1,705 and affecting 14 persons, while the cost of extinguishing them was \$502.97.

Decisions on Laws.—The legislative act providing that process may be served on private corporations by leaving copy with register of deeds has been pronounced unconstitutional as taking property without due process of law.

Doubt having arisen as to the construction of the law for taxing inheritances passed at the last session of the Legislature, in view of the decision of the United States Supreme Court that the Federal law does not impose a tax unless a legacy amounts to \$10,000, although the personal estate may exceed that amount, the State Attorney-General gave the opinion that the Wisconsin law makes legacies taxable when less than \$10,000, if the total value of the estate is more than \$10,000.

Political.—The State election took place in November. There were five tickets—Republican, Democratic, Prohibition, Social-Democratic, and Socialist-Labor.

The Republicans chose delegates to the national convention and presidential electors at large at their first convention, April 25, in Milwaukee.

The second Republican convention was held in Milwaukee, Aug. 8. Eight names had been mentioned for the gubernatorial nomination, and there were 6 avowed candidates—R. M. La Follette, E. M. Rogers, J. M. Whitehead, A. M. Jones, I. B. Bradford, and De W. Stebbins—but before the end of July all except Mr. La Follette had withdrawn. This was a great surprise, as Mr. La Follette has been out of harmony with his party for some time—at least with its leaders in the State—his ideas on politics and economics being deemed too radical. He was nominated by acclamation, and the present incumbents of the other State offices were renominated without opposition. The platform declared in favor of some of the changes in State law which Mr. La Follette has most earnestly advocated, notably the nomination of candidates by primary election and the abolition of caucuses and conventions. It said:

"We indorse the administration of Gov. Scofield and the other present State officers as clean, capable, and businesslike; and heartily commend its efforts toward carrying out the pledges of the Republican State platform adopted at the convention of 1898.

"We recommend that caucuses and conventions for the nomination of candidates for office be abolished by legislative enactment, and that all candidates for State, legislative, congressional, and county offices be nominated at primary elections upon the same day, by direct vote, under the Australian ballot.

"The establishment by the last Republican Legislature of a State tax commission for the purpose of an exhaustive investigation of the complicated questions of taxation was in accordance with the principles of sound public policy.

"The growth and development of business and commercial affairs require and necessitate large aggregations of capital, and great enterprises may be honestly and fairly conducted, with legitimate profits to investment and substantial good to the community; but combinations and trusts that destroy competition, restrain trade, and create monopolies should be prohibited by law; and we demand the enactment of such legislation, State and national, as shall render these abuses impossible.

"We believe that the demand for better highways, made by the farmers of Wisconsin, should be encouraged by the State, as favoring an improvement of great practical value to the agricultural interests."

Following is the ticket: For Governor, Robert M. La Follette; Lieutenant Governor, Jesse Stone; Secretary of State, William H. Froehlich; State Treasurer, James O. Davidson; Attorney-General, Emmett R. Hicks; State Superintendent, Lorenzo P. Harvey; Railroad Commissioner, Graham L. Rice; Insurance Commissioner, Emil Giljohann;

Chairman of State Central Committee, Gen. George E. Bryant.

The Democratic State Convention met in Milwaukee, June 12, chose delegates to the national convention, and adopted resolutions on national issues, approving the Chicago platform, expressing love for and devotion to Mr. Bryan, and denouncing "the Republican party for its brazen inconsistency in treating Porto Rico as a part of our territorial possession, and at the same time unjustly discriminating against its people, as well as our own, by imposing a burden of tariff, in express violation of the Constitution of our country; in establishing a system of imperialism repugnant to the spirit of our institutions, and necessitating the maintenance of a system of militarism that threatens the perpetuity of our Government, for the sole purpose of gain and conquest; in establishing for all time a scheme of taxation under the guise of war taxes, for the purpose of maintaining a standing army, at a time when peace should prevail, and providing revenue made necessary by a policy of exorbitant and prohibitory tariff impositions, practiced in the interests of monopolies and trust combinations, that have been fostered by the present administration; in the profligate and corrupt use of the public funds in fraudulent army contracts, and the purchase of war vessels; and we point to the gigantic postal frauds in Cuba as a fair sample of Republican integrity."

The remaining paragraphs condemned trusts, favored election of United States Senators by direct vote, and expressed sympathy for the Boers.

The second Democratic convention, in Milwaukee, Aug. 22, named the following candidates: For Governor, L. G. Bohmrich; Lieutenant Governor, Thomas Patterson; Secretary of State, J. H. Woodnorth; State Treasurer, August Bartz; Attorney-General, G. C. Cooper; State Superintendent, Homer B. Hubbell; Insurance Commissioner, G. W. Hill; Chairman State Central Committee, A. D. Warden.

Twelve presidential electors were also nominated.

The platform repeated the declarations of the June convention on national issues. In regard to two of the four constitutional amendments that were passed by the Legislature of 1899 and will come before that of 1901 before being submitted to the people, it said:

"We are opposed to joint resolution No. 13 proposing an amendment to Article XI of the Constitution of Wisconsin, giving the Legislature power to pass a general banking law, and believe that the people should continue to be vested with the ultimate power to vote upon the passage of any banking law.

"We are opposed to joint resolution No. 16, proposing an amendment to section 1 of Article X of the Constitution of the State of Wisconsin, relating to education. This proposed amendment is in conflict with the recently expressed vote of the people as to the supervision of public instruction, and opens the way for the vesting of the control of the public schools arbitrarily in the hands of the State Superintendent and the taking away from the people of the various counties the election of county superintendent."

A convention of the People's party was held in Milwaukee, Aug. 22. The nominations of the Democratic party for presidential electors were adopted, and the convention decided not to put out a State ticket. Besides approving the national party platform, the resolutions demanded abolition of monopoly in money, transportation, and land; direct legislation known as initiative and referendum; public control of public utilities,

national, State, and local; a primary election law; the issue of all money by Government directly through the Government banks; abolition of the arbitrary power assumed by judges in granting injunctions; a legal eight-hour work day; municipal home rule; and the abolition of prison contract and child labor.

The Prohibitionists met in convention in Madison, Aug. 22, and adopted a platform in line with the party principles, approving the national candidates, and saying:

"We declare that no substantial reform can be made by legislative enactment for purer primary and general elections so long as the saloon debauches the citizen and breeds the purchasable voter. Break down the rum traffic, elevate manhood, and a sober citizenship will give us an honest ballot.

"We are in favor of equal and just taxation, and as the first step to this end we demand the repeal of the present license laws of this State, which take more than \$2,000,000 from the wives and children of drunkards, that should be levied upon the property instead of the poverty of our people. This can only be done by the enactment of a prohibitory law in place of the license system, which is wrong in principle, vicious in theory, and a failure in practice."

The ticket follows: For Governor, J. B. Smith; Lieutenant Governor, T. K. Torvildsen; Secretary of State, Edwin Kerswill; State Treasurer, H. J. Noyes; Attorney-General, E. W. Chafin; Superintendent of Public Instruction, H. C. Senn; Railroad Commissioner, V. M. Weeks; Insurance Commissioner, F. R. Derrick; Chairman of State Central Committee, J. E. Clayton.

Howard Tuttle was nominated for Governor by the Social-Democrats, who met in convention in Milwaukee, Sept. 1.

The election gave the offices to the Republican candidates. The vote for Governor stood: La Follette, 264,420; Bohmrich, 160,674; Smith, 9,712; Tuttle, 6,590; Wilke, Socialist-Labor, 7,095. The Legislature will consist of 31 Republicans in the Senate and 81 in the House, and 2 Democrats in the Senate and 19 in the House.

The presidential vote was: McKinley, 265,916; Bryan, 159,284; Woolley, 10,124; Debs, 7,095; Malloney, 524.

WYOMING, a Northwestern State, admitted to the Union July 10, 1890; area, 97,890 square miles. Population in 1890, 60,705; in 1900, 92,531. Capital, Cheyenne.

Government.—The following were the State officers during the year: Governor, De Forest Richards; Secretary of State, F. Chatterton; Treasurer, G. E. Abbott; Auditor, Leroy Grant; Adjutant General, Frank A. Stitzer; Attorney-General, J. A. Van Orsdel; Superintendent of Education, T. T. Tynan; Supreme Court: Chief

ROBERT M. LA FOLLETTE,
GOVERNOR OF WISCONSIN.

Justice, C. N. Potter, Republican; Associate Justices, Samuel T. Corn, Democrat, and Jesse Knight, Republican; Clerk, R. C. Morris.

Population.—The population of the State, by counties, in 1900, according to the Federal census, was as follows: Albany, 13,084; Bighorn, 4,328; Carbon, 9,589; Converse, 3,337; Crook, 3,137; Fremont, 5,357; Johnson, 2,361; Laramie, 20,181; Natrona, 1,785; Sheridan, 5,122; Sweetwater, 8,455; Uinta, 12,223; Weston, 3,203; Yellowstone National Park, 369.

Finances.—The Treasurer's statement of Sept. 30, 1900, shows a net balance in the general fund, after allowing for outstanding warrants, of \$22,304.43, a net gain of \$25,992.44 over 1898. The Treasurer's cash statement is as follows: Cash balance, Oct. 1, 1898, \$103,785.69; receipts from all sources, \$714,135.21; investments repaid, \$42,107.16; disbursements, \$625,195.82; investments, \$63,147.16; cash balance, Sept. 30, 1900, \$171,685.08. This shows a gain in the cash balance of \$67,949.39 over the cash balance of 1898.

The details of State expenditure for the fiscal year ending Sept. 30, 1900, show, among other items, the following: Care of convicts, juvenile delinquents, and deaf, dumb, and blind, \$29,079.54; insane, \$17,278.58; Soldiers' and Sailors' Home, \$5,234.38; Wyoming General Hospital, \$12,894.49; university, \$8,726.51; interest State bonded debt, \$19,200.

Valuation and Taxation.—The Treasurer's report shows the total valuation of property within the State in 1900 to be \$37,892,303.81; number of cattle 359,069, valuation \$6,154,640.05; number of sheep 2,624,689, valuation \$5,426,493.25. The taxes levied in 1900 were as follow: State, \$227,510.13; county, \$280,771.12; general school, \$48,381.13; interest on county bonds, \$80,293.32; library, \$4,054.36; judgment and State deficiency, \$14,000.97; special school, \$159,925.61; payment school bond interest, \$19,454.58; payment county bonds, \$19,172.11; total, \$853,563.23.

State Lands.—The rentals for the State lands increased from \$22,268.69 in 1892 to \$91,589.81

in 1900, the great increase having occurred during the past two years, viz., from \$40,684.07 in 1898 to \$91,589.81 in 1900. The State owns 3,001,905.48 acres of school sections, being sections 16 and 36 in each township. Of this amount, 918,054.47 acres have been leased, 553,477.93 during the past two years.

Education.—The report of the Superintendent of Public Instruction shows that in the past two years 524 schools were maintained, and more than 14,000 pupils received instruction.

Soldiers' and Sailors' Home.—Since the establishment of this institution, in 1895, 71 persons have been admitted. The present membership is 21; the gain during the year by admission and readmission was 18; the loss from various causes was 13. The average attendance of men for the year was 21.25; women, 2.66. The average cost of maintenance per capita for the year ending Sept. 30, 1898, was \$288.85. The average cost for the past year was \$211.56. The total cost of maintenance for the past year was \$5,234.38. Of this amount, \$1,507 was received from the General Government.

Penitentiary.—The average daily number of all convicts, State and Federal, and the total net cost for care and maintenance of them during the past five years, are as follow: In 1895, 107.38 convicts, cost \$5,193.97; in 1896, 111.68 convicts, cost \$22,841.15; in 1897, 120.47 convicts, cost \$23,576.60; in 1898, 136.11 convicts, cost \$22,964.21; in 1899, 144.48 convicts, cost \$25,604.41. In 1900 56 new prisoners were admitted to the Penitentiary.

Coal Mining.—The State Inspector of Coal Mines reports the output of the mines of Wyoming as 3,777,487 tons in 1899. Seven new mines have been opened recently.

Political.—At the presidential election the Republican ticket received 14,517 votes; the Democratic-Populist, 10,298. The vote for Congressman was: Mondell, Republican, 14,539; Thompson, Democrat, 10,017. The Legislature consists of 18 Republicans in the Senate and 37 in the House, 1 Democrat in the Senate and 2 in the House.

Y

YACHTING. Yachting antedates in antiquity most of the sports and recreations of the present day, but its development naturally has been most noticeable during the century just closed, when popular pastimes have kept pace with the enormous growth of moneyed interests, and everything social and political has advanced with a rapidity not heretofore known in the history of the world. Evidences are not wanting that pleasure craft, propelled by oars or sails, were used by the earliest maritime peoples known to history, and mention is even made of such craft in the semimythical legends of prehistoric times. It is but a few years since a sumptuous houseboat (or whatever may have been the Roman equivalent for the term) was discovered at the bottom of an Italian lake, and it now adorns a neighboring resort for the instruction of the passing throng.

It appears in Pepys's Diary that in January, 1660, one Commissioner Pett, a shipbuilder of Deptford, England, was building for Charles II a vessel described as a yacht, and that in July of the same year a Dutch sailing yacht lay in the Thames below London Bridge, and was visited by his Majesty, who did it the honor to dine on board. Subsequently the King defeated his Dutch visitor, and likewise at the same time his brother, the Duke of York, in a sailing match from Green-

wich to Gravesend and back, the stake being 100 guineas. This is the first stated yacht race of record in British waters.

It is not here intended to relate in detail the history of this luxurious and costly recreation. In England, as has been seen, it had its beginnings under the patronage of the "Merry Monarch"; and while it probably had its periods of depression during the reaction that followed his extravagant reign, it reasserted itself shortly afterward, and by 1720 the first yacht club was established at Cork, Ireland. The Royal Yacht Club followed in due course at Cowes, England, being organized in 1812 with 50 members. At about the same time wealthy American gentlemen, notably the more prominent among merchants and shipowners, were afloat in handsome sailing craft richly furnished and equipped, some of which did valiant service as privateers in the sea wars that followed.

The first regularly organized American yachting association was the New York Yacht Club, established in 1844 with 9 members, Commodore John C. Stevens, Esq., being commodore. This grew out of the Hoboken club, whose fleet consisted mainly of sailboats and is hardly to be recognized as a regular yacht club. The first stated match was sailed by the club fleet from Robbin's Reef, within

New York harbor, as a starting point, to and around the Southwest Spit Lightship and return, the schooner *Cygnets* being the winner.

In 1851 occurred the picturesque series of incidents that led to what are now known as the international races, and won for American sailing yachts a supremacy which they have since retained. Often as the story of the schooner *America* has been told, there is a popular demand for its repetition whenever a cup race is expected. Therefore, as this paper must needs refer to two such races, a brief summary seems to be called for here. The *America* was designed and built by George Steers, and, representing the New York Yacht Club, sailed for England under the command of John C. Stevens, commodore of the club. She so utterly defeated and outmaneuvered not only the whole Royal Yacht Squadron, but every sailing vessel that could be brought against her, that by common consent she was recognized as the swiftest sailing yacht in existence. She was awarded the silver cup that bears her name and is regarded as the highest existing prize open to competition among amateur sailors. Her sail plan and the model of her hull revolutionized the ideas of English builders, and twenty years passed before a challenge was sent across the ocean and an effort made to win back the cup, and with it the formerly acknowledged supremacy of British yachts.

A beginning once made, other challenges and contests have followed at irregular intervals, to the number of 10, resulting in every instance in victory for the American contestants. Disagreements and misunderstandings have arisen from time to time, and controversies about the racing conditions have occasionally waxed so bitter as to threaten all possible friendly relations; but it is believed that a mutual understanding has now been reached which, with the good faith that may be presumed for both sides, should prevent any serious dispute in the future.

The subject of yachting was last treated in the Annual Cyclopædia in 1896. At that time, owing to the inconsiderate and unwarrantable course of Lord Dunraven during his contest for the *America's* cup, it was generally believed on both sides of the ocean that many years must pass before another challenge would be authorized by any British yacht club; for, while to Americans the case, after a most careful investigation, seemed to be clear against the plaintiff, it was far otherwise in England, and it was not considered possible that what many Englishmen regarded as an affront to a British nobleman would be soon forgotten or overlooked. A fresh challenge came, however, far sooner than was expected.

In 1897 it became evident that "mug hunting" was assuming an overruling prominence not altogether to be commended. The fun and good fellowship encouraged by scrub races and friendly maneuvering while sailing for pleasure were crowded out and discouraged by the racing machines, whose owners shunned every contest unless the conditions were such as to favor their individual boats. This state of things was further fostered by those yachtsmen and sailors of smaller craft who, favored by large means, were able to build and equip a new boat, or perhaps more than one, for every racing season, embracing all the improvements that had been devised in the meantime, and thus gaining an advantage hardly to be estimated over their less favored rivals.

In the smaller classes there were some fine contests. An exciting series of trial races off Oyster Bay, Long Island, resulted in the choice of *Momo*, designed and sailed by Clinton Crane, to try and

bring back the *Seawanhaka-Corinthian* challenge cup, won by the Canadians in 1866. The Canadian defender was *Glencairn II*, built and sailed by Mr. H. Duggan. She was successful in her defense, and the cup remained in Canadian hands, and Mr. Duggan was universally recognized as a designer of remarkable ingenuity and as a sailor of the highest skill.

In the large schooner class there were exciting contests between the *Emerald* and *Colonia*, two large vessels of modern build and rig, which were considered the finest type of their class. *Colonia* was the winner in the larger number of trials.

Off Newport a series of races occurred between the *Syce* (F. M. Hoyt, owner) and the *Vencedor* (H. M. Gillig), both cutters about 50 feet in length. The last-named vessel was brought from the Great Lakes, where she had beaten everything in her class, to try conclusions with her salt-water sisters. She was badly beaten, owing largely to a series of unlucky mishaps, and she has since been taken back overland to her native element, the fresh-water seas.

In 1898, owing to the war with Spain, yachting in American waters was reduced almost to its lowest terms. All the principal harbors along the coast were very properly planted with defensive systems of mines and torpedoes, and the vigilance of guard ships, patrol boats, and cruisers interfered sadly with the freedom of the seas as regards the convenience of pleasure craft. For these reasons the annual summer cruises of the large yacht clubs were omitted. It is noteworthy, however, that 28 large steam yachts were purchased by the Government and converted into gunboats, some of which rendered distinguished service in action. Notable among these was the *Gloucester*, formerly the *Corsair*, which under the command of Lieut. Richard Wainwright did not hesitate to engage at close quarters two Spanish "destroyers," both of which were sent to the bottom in short order, though not entirely, perhaps, by the yacht's guns. Many yachtsmen, too, entered the service, some of them as officers, but more as enlisted men, in the regular navy as well as in the reserves, their training in amateur seamanship having qualified them for posts of responsibility and danger.

While all this very naturally interfered temporarily with yachting in its more pacific aspects, it tended to develop the single-hand cruiser classes by taking out of the way the temptation of larger and more luxurious craft. The small boat has always been the true training school for efficient seamanship and all-round usefulness among sailor men.

On Aug. 6 the New York Yacht Club received preliminary notice of a challenge for the *America's* cup from the Royal Ulster Yacht Club of Ireland, in behalf of Sir Thomas Lipton, a wealthy tea merchant. It was subsequently arranged that the races should take place in early October of 1899, that season of the year being chosen as more likely to afford favorable conditions of wind and weather than usually prevail at an earlier date.

The races for the *Seawanhaka* challenge cup were sailed, after the usual trials for the selection of the swiftest boat, near Montreal; the contestants were the *Dominion*, built and sailed by H. Duggan for Canada, and the *Challenger*, Clinton Crane, for the United States. The Canadian won in all but one of the races, and that was lost only because he ran afoul of his antagonist. Owing, however, to the peculiar construction of the Canadian boat, something approximating the double-hull idea of a catamaran, much indignation was expressed on the part of the *Challenger*, and

Mr. Duggan's position was by no means unanimously sustained even by his own countrymen. Yet the cup indisputably remained in Canada.

The yachting event of 1899 overshadowing all others in popular interest was the series of races for the America's cup, sailed off New York harbor, beginning Oct. 3, and ending with a victory for the American boat on Oct. 21. The contestants were the Shamrock, Sir Thomas Lipton owner, designed and built by Mr. Fife, at the Clyde shipyards, and the Columbia, owned by a syndicate of American yachtsmen and designed and built by the Herreshoff Brothers, of Bristol, R. I. In general dimensions the two boats were so nearly identical that to the average reader a printed description of them would convey an idea of very little difference; but in actual appearance the American was far more graceful and seemed more capable of slipping easily through the water under the impulse of her immense spread of canvas than did her speedy rival, equipped though she was with what was almost universally considered a better set of sails. That the American spars were capable of bearing all reasonable strains the result proved, for no serious accident befell her in this respect, while the Shamrock carried away her topmast under not very severe conditions during the second race.

Contrary to the hopes of all who were interested, the season of the year proved quite as baffling in regard to wind as earlier dates had proved in former races. Before the three races called for by the conditions could be sailed the yachts were brought to the starting line eleven times, but in the end the American boat justified the hopes of her builders and owners by winning handsomely in every instance.

One notable feature of the races this year was the very largely increased expenditure in equipment and tuning up of the respective craft. Sir Thomas Lipton not only incurred the very heavy expense of bringing his boat across the Atlantic properly rigged for the encounter of heavy weather, but she was accompanied by a steam tender, which remained with her throughout the season, serving as quarters for the crew and for Sir Thomas and his friends, and being fitted up in effect as a floating machine shop capable of effecting almost any repairs that might become necessary. On the part of the Americans, the Government took steps to preserve order during the races, and one of the most efficient fighting officers in the service, Capt. Robley D. Evans, was placed in command of a large fleet of armed launches and gunboats, which kept all excursion steamers and other craft out of the way of the racers. Not even Englishmen disposed to find all possible occasion for complaint ventured to make any protest as to the management in this regard.

Sir Thomas Lipton made friends of all with whom he came in contact, accepting his defeat with good nature and frankly admitting that the Columbia was the better boat.

It must be remembered that to some extent the challenging party in these international races is handicapped by the provision requiring him to bring his boat across the Atlantic Ocean on her own bottom, thus prohibiting the possibility of transporting a flimsily built racing machine across the dangerous waters on the deck of an ocean steamer. At first glance the condition seems fair, and it is not seen how it can reasonably be objected to; still it must be confessed that there is a suspicion of disadvantage inseparable from the idea of pitting a boat that has actually crossed the ocean against one that in all probability never will be required to go out of sight of land.

The Canadians won in the international match for half raters, the Glencairn III, of the Royal St. Lawrence Yacht Club, defeating the Constance, of the Seawanhakas (New York).

In 1900 the usual international contest between half raters took place on Lake St. Louis, St. Lawrence river, early in August. The Canadian defender was the Red Coat, of the Royal St. Lawrence Yacht Club, and the challenger was the Minnesota, of the White Bear Club, of St. Paul, Minn. The victory remained, as before, with the Canadian.

In the reasonable hope that the next challenge for the America's cup would permit the building of smaller boats for the contestants, a "70-foot" class was created, and fairly satisfactory results were obtained, the yachts being nearly as fast as the great 90-foot racers, and involving so much less expense and trouble that it was believed that the general interests of the sport would be furthered thereby.

These hopes proved vain, however, for on Oct. 2 a challenge was received in due form from Sir Thomas Lipton, through the Royal Ulster Club. This was accepted, and the conditions agreed upon in 1898 were re-enacted with slight amendments. The first race is fixed for Aug. 20, 1901, the others to follow as rapidly as possible provided there is wind enough to sail. At this writing the prospective contestants are in course of construction—larger, costlier, and more strictly racing machines than any of their predecessors.

YUKON, TERRITORY OF, a northwestern territory of the Dominion of Canada; population in 1900, 15,500.

Government and Regulations.—The Canadian district of Yukon was constituted a separate territory, under control of the Minister of the Interior, at Ottawa, with the name of the Yukon Territory, in 1898. The first Commissioner, appointed on July 4 of that year, was William Ogilvie. He has associated with him as an Executive Council the following officials: A. B. Perry, Superintendent of the Northwest Police; A. C. Senkler, Gold Commissioner; J. E. Girouard, Registrar of Lands; Mr. Justice Dugas, *ex officio*; W. H. P. Clement, Legal Adviser. In July, 1900, arrangements made by the Dominion Government for local elected representatives in the Council marked the first step of a self-governing community, and in the parliamentary session of the same year the Government at Ottawa, while refusing to support Sir Charles Tupper's motion for an immediate grant of representation to the territory, announced that it would be given before long. On Aug. 17 a large number of changes and amendments in the land, mining, and timber regulations of the Executive Council were announced. They included and dealt with river-dredging leases, placer-mining conditions, hydraulic-mining leases, the recent discoveries of coal, mining disputes, and certificates to miners.

Expense of Government.—The expenditure from the Consolidated fund of Canada in behalf of the Yukon Territory is officially given as \$47,027 in 1898, and \$1,098,379 in 1899. To this latter sum must be added federal expenditures out of ordinary revenue of \$12,647 upon the administration of justice; \$387,764 upon militia—practically the maintenance of the mounted police; \$68,619 upon public works; \$55,953 upon railways; \$28,932 upon the customs; \$21,950 upon postal facilities. The local revenue accruing to the Dominion Government in 1899 included \$575,813 from gold royalties; \$227,354 from miners' certificates; \$262,020 from placer grants, renewals, etc.; \$36,006 from mining fees; \$44,396 from land rentals.

\$54,098 from timber dues; \$482,099 from customs. The total, including various miscellaneous items, was \$1,753,376.

Reforms.—On Aug. 14 the Earl and Countess of Minto arrived at Dawson City on a vice-regal tour. A voluminous memorial, presented to his Excellency by the Citizens' Committee, set forth at length the position and troubles of the population and their requirements and complaints against the Government. The summary and conclusion of this document were as follow:

"Wherefore your petitioners pray that your Excellency will take means to bring before your advisers and the Parliament of Canada:

"1. The necessity for immediately doing away with, or at least greatly reducing, the present royalty tax on gold mined in the Yukon Territory.

"2. The necessity of preparing roads and bridges and affording free means of communication within the Yukon Territory.

"3. The necessity of opening for location to free miners parts of the Yukon Territory owned by the Government which are fit for placer mining.

"4. The necessity for reducing the present fees for free miners' certificates and for recording and renewing placer-mining claims.

"5. The necessity for altering the hydraulic-mining regulations so as to secure for the free miner the right to locate, record, and work any ground which is fit for placer mining, whether covered by a concession or not.

"6. The adoption and enforcement of such mining regulations as will encourage to the utmost the prospector first, the miner second, and the investor third, and throw open the country for the fullest and freest development.

"7. The necessity of granting representation to the people of the Yukon by at least two members in the House of Commons of Canada.

"8. A legislative council wholly elected by the citizens of the Yukon Territory.

"9. The necessity of putting the liquor trade of this territory under such regulations as to subject it to the laws of trade and insure commercial freedom.

"10. Establishment of proper courts and a court of appeal in and for the Yukon Territory.

"11. The necessity of securing or establishing a free British port of entry on the western coast of America within reach of the head waters of the Yukon river, in order to encourage the trade and commerce between the Yukon Territory and the other portions of the Dominion of Canada."

Lord Minto answered: "As the constitutional representative of her Majesty, you are well aware that I have no direct voice in the legislative affairs of the Dominion; but I must say that I believe I shall be able to make such suggestions as a result of this visit that great good to the country will accrue therefrom." The Dawson Board of Trade, on July 17, had passed the following:

FANNING ON THE ELDORADO.

"Whereas, the Yukon Territory is without representation in the House of Commons of Canada and is administered by officials of the Government of Canada; and whereas, the wishes and interests of the people of the Yukon Territory are not represented in any parliamentary or legislative body making laws or regulations for the governing of the Yukon Territory; and whereas, the development of the Yukon Territory is dependent upon the development of the mining industry in said territory, and the discovery of rich mining areas converts what has hitherto been wasted and valueless portions of this territory into great resources of wealth, not only to this territory but the Dominion of Canada as a whole; and whereas, the greatness of the resources of the Yukon Territory

are undoubted, and the certainty of an ever-increasing population assured, if the territory is granted wiser and proper administration and laws; and whereas, the richer portions of gold placer claims on Bonanza and Eldorado creeks have been largely worked out and the mining industry is no longer able to bear the burdensome restrictions and imposts now levied, and the existing adminis-

view of the great expenses connected with the opening up and government of a new and very distant country. As Dawson grew into an organized town and the territory into a region of stable law and settled administration, the vague complaints and incoherent discontents of the pioneer period took form, and on July 17, 1900, the Dawson Board of Trade formally petitioned the Gold

A DOG TEAM ON THE WHITE PASS TRAIL.

tration and regulations must be promptly remedied in order to avert financial disaster to the territory; and whereas, the true condition of the mining industry and the necessities of the Yukon Territory are but little known in eastern Canada, and the Parliament and Government of Canada have not hitherto appeared to be fully informed in regard to the said conditions and necessities (or, if so, heedless of the results), and the laws and regulations enacted by said Parliament and Government for the governing of special industries of the Yukon Territory, and should be immediately changed; now, therefore, be it resolved, that the board of trustees do take immediate steps to raise a fund of \$50,000 to be used as the board of trustees shall direct, to place before Parliament and the people of Canada the true position of industries, resources, and administration of the Yukon Territory, and to obtain such necessary reforms in the present regulations, law, and administration as to insure the development and prosperity of the Yukon Territory."

Mining Royalties.—The situation in the Yukon during the past few years in connection with Government royalties upon minerals has been peculiar. As an inevitable ground for complaint and dissatisfaction among a large and floating population of ignorant miners, it has interjected an issue into the politics and Parliament of the Dominion. The original royalty was imposed in

Commissioner for the abolition of the royalty and the substitution of an export duty not exceeding 2 per cent. on all the gold taken out of the country. Between 1896 and 1898 there was an influx of about 30,000 persons into the territory.

Altogether, the annual revenues of the Dominion derived from taxes, royalties, and customs duties in the Yukon are placed at \$2,000,000.

Mines and Minerals.—The gold production of the Yukon is officially placed at an average of about \$100,000 a year between 1885 and 1896. In 1896 it was \$300,000; in 1897, \$2,500,000; in 1898, \$10,000,000; and in 1899, \$16,000,000. The actual production during the past three years has been probably at least \$20,000,000 annually, as much gold dust is carried away without record.

Miscellaneous.—Early in May the result of the first Yukon census was announced. It showed a total population of 13,000 men, 2,000 women, 500 children. Of these, 4,500 were British subjects, 9,000 Americans, 330 Indians. In the Klondike region itself there were 8,805 persons, including 2,767 British subjects, 5,539 Americans, and 499 of other nationalities. The population of Dawson was put at 5,404. In September, 1900, gold dust dropped in value about \$1 an ounce, and the commercial current price, which had been \$17 in 1896 and became \$16 in 1898, was placed at \$15 by the Dawson Board of Trade, owing to continued intermixture with black sand.
